### LOOSE CREDIT OPENS SHOPS FROM BICYCLES TO GROCERIES

**Frequent Breakages Prove Ineffectual to Stop Amateur Assembling By Incompetent Builders.**

Buffalo, Oct. 31.—To such concerns as the alley cycle company and the universal tinker repair shop is traced much, if not all, of the trouble experienced the early part of the season by reason of broken forks, which for a time played havoc with the trade. These accidents, as will be remembered, became of so frequent occurrence, and the nature of the injuries so serious, as to arouse public feeling to the extent that legislation was demanded by the press, both editorially and by letters to the editor, for some measure that would protect users of bicycles from the skull and bone cracking that was prevalent at that time.

#### Sold on Long Time Payments.

In the '97 season these concerns made a few bicycles and became so flushed with their success that the conclusion was jumped at that they were destined to become large makers, and forthwith set about enlarging their shops and adding new (?) machinery. The result was that the fore part of the season found many bicycles of this class in use, principally by the younger class of riders. The machines were sold cheaply and on long time payments. They were badly constructed, and it was not surprising to those with a knowledge of bicycle construction that fork fractures became epidemic immediately upon the introduction of the machines. The general public had no means of knowing what makes were responsible for the accidents, so the press was called on to publish the names of such bicycles, that the public could avoid that particular make. This, of course, would not do, for, as one editor said, injustice would be done some maker who, through no great fault of his, might have one of his bicycles break, which might be the only one in thousands.

#### Shops Now in Full Blast.

The end as far as these establishments were concerned was thought to be in sight when, from time to time, as the season advanced, almost daily announcement was made of the closing up of one or more of these shops. The failures were due primarily to the refusal of tire and parts makers to supply them on anything but a cash basis, but it is with the bicycle as with other business, that someone can always be found ready and willing to sell regardless of the standing of the party or the injury liable to be worked to legitimate business; so it is but natural that after a time these shops are found in full blast, turning out a product that is

destined to cause a repetition of the trouble another year.

The change from the bicycle to the grocery business is one of the remarkable happenings of the week. Finn & Sullivan, who were the local agents for Orient cycles last summer and who recently were forced to give a chattel mortgage on their stock and fixtures to Waltham Mfg. Co., have opened a grocery store in their old quarters.

### URGE SUPREME COURT ACTION

**Interested Persons Demand That Legal Forms for Bankruptcy Law be Provided Quickly.**

Washington, D. C., Nov. 2.—A clamorous crowd of lawyers and representatives of firms interested in the new bankruptcy law are in Washington to urge the supreme court to prepare the blanks and forms to make the law operative. The new federal law on the subject has repealed every state insolvency law, and therefore there is no legal provision for bankruptcy at this time.

The supreme court members claim to have been too much occupied with other business to prepare the forms. It is already plain, say the attorneys, that if the delay continues for a month, as now seems probable, it will embarrass many millions of property interest and may cause much litigation.

### AMERICAN HUMBER CO. TO QUIT

**New York Department Store Managers Say No More American Humbers Will be Made.**

Adams & Co., the New York department store managers, intimate in their advertisement in New York papers last Sunday that the American Humber company has stated to them that prevailing conditions in the cycle trade would be likely to compel them to close their factory for 1899, except for the purpose of replacing defective or broken parts.

The only rational explanation of the course taken by the American Humber Company in permitting department stores to make a plaything of its prices is thus furnished, and the anticipations of the manufacturing trade in general concerning the motives of the company's policy are justified.

### EFFECT OF CANADIAN TARIFF INCREASE OF EXPORTS CHECKED

**Though Paying Higher Duty on United States Goods Canadians Continue to Buy Them.**

The first month of the new Canadian tariff does not appear to have had the depressing effect upon exports from the United States into Canada that was anticipated. The report of the Department of Trade and Commerce in Canada, covering the month of August, 1898, and comparing with the corresponding months of 1897 and 1896 has just reached the Treasury Bureau of Statistics. The figures which it presents are especially interesting since they cover the first month of the operations of the new tariff which gives the goods coming into Canada from Great Britain and certain British colonies 25 percent advantage in tariff rates over those coming from the United States.

#### Reciprocity in New Form.

The new Canadian tariff law, enacted in 1897, provided that when the customs tariff of any other country is made as favorable to Canada as her own tariff rates, the duties upon the products of that country should at once be lowered one-eighth, and after the expiration of one year, should be reduced another one-eighth. The 12½ percent reduction went into operation August 1, 1897, and was held to affect goods coming into Canada from Great Britain, Germany, Belgium, and several other countries, thus giving to most of the imports coming into Canada an advantage of 12½ percent in rates of duty as against those from the United States, which were required to pay the full rates named in the new law. Additional legislation in 1893 so modified the act that the reduction of 25 percent, which was to take effect on August 1, 1898, is held to relate only to goods coming into Canada from the United Kingdom, Bermuda, British West Indies, British Guiana, or "any other British colony or possession, the customs tariff of which is on the whole as favorable to Canada as the British preferential tariff is to such colony or possession."

This modification of the tariff act of 1897 thus gives to goods from Great Britain and most of her colonies an advantage, on and after August 1, 1898, of 25 percent in rates of duty over those from the United States, or in other words, requires goods from the United States to pay 1-3 higher tariff rates than those from the countries in question. The figures showing the imports into Canada during August, the first month under the new arrangement, are therefore especially interesting.

It was expected that the imports from

Great Britain and her colonies in August, 1898, would be abnormally large because of the fact that importers, knowing that they would obtain better tariff rates in August than in June or July, would wherever practicable hold back their imports until the new rates should go into effect. August 1, while no such condition would apply to goods from the United States. It was presumed, therefore, that whatever might be the final effect upon the relative growth of British or American imports into Canada, those of the month of August would show much greater gains for Great Britain than for the United States.

#### Figures of Principal Imports.

The figures presented in the report in question, however, do not justify this expectation. While the report does not state the total amount of goods from Great Britain imported into Canada during August, it does give a table containing qualities and values of "principal articles of merchandise exported from Great Britain to British North America during the month of August, 1898, compared with August, 1897 and 1896." The total value of these "principal articles" exported from Great Britain to Canada in August, 1898, was 11.4 percent in excess of the same class of articles exported to Canada in August, 1897, when the tariff advantage was but 12½ percent, and is actually less than in August, 1896, when the tariff gave no advantage to articles from Great Britain. On the other hand, the reports of the Bureau of Statistics of our own government show that the exports from the United States into Canada in August, 1898, were 12½ percent greater than in August, 1897, and more than 25 percent in excess of those of August, 1896.

#### Explanation of the Records.

It is not to be inferred from these figures that the Canadian tariff legislation has had no depressing effect on our exports, but that the causes tending to increase our exports in certain lines were strong enough to overcome the adverse legislation in a measure, and that they would have been still larger if the discriminating tariff law had not been in force. That this is the proper explanation of the increase for August, 1898, is especially clear when this increase is compared with the much greater increase of our exports to European countries which has lately been recorded and when it is noted that the high total figure of exports to Canada is chiefly due to one line of goods, agricultural implements, of which there was sold in August this year \$223,818 worth, as against \$61,075 in 1896 and \$71,519 in 1897. This difference of about \$160,000 constitutes alone more than the increase of 12½ percent in the total over 1897 and nearly two-thirds of the increase over the total for 1896. It is therefore apparent that it would be rash to put a low estimate on the effects of the discriminating legislation per se. As against the wave of liberality in purchases of American goods which has swept over the entire civilized world, it has been sufficient to so stem the tide as to almost neutralize the effects of this favorable change of sentiment in Canada, although this neighboring territory is one of those where the effects should have been felt most strongly.

#### Monarch Company Gets Damages.

In a breach of contract suit brought by the Monarch Cycle Manufacturing company against the Roger Wheel Company, of Cincinnati, the jury in the district court gave the plaintiff a verdict for \$3,580 damages on October 28. On the cross petition of the Roger company the jury gave a verdict of \$1,808 damages.

## PATENTS AND TRADEMARK LAW

### EQUAL RIGHTS FOR ALL NATIONS

#### Protection of American Rights Abroad Depends Upon Changes in Federal Laws at Home.

The Convention for the Protection of Industrial Property of 1883 marked the beginning of international protection for property rights embodied in construction or design of merchandise. The nations which were members of the Union at the time, and those which afterwards joined it made attempts to conform to it in subsequent legislation.

The provision of the convention that citizens of each of the contracting states shall enjoy in all the other states of the Union, so far as concerns trade or commercial marks and commercial names, the advantages that the respective laws thereof at present accord to citizens, seems to require in this country the enactment of a Federal law on the subject of trade marks, which shall definitely define and regulate them.

The convention provides that every trade or commercial mark regularly deposited in the country of origin shall be admitted to deposit and so protected in all the countries of the Union; whether the convention be carried into effect in favor of United States, so long as there is no constitutional provision for a Federal trade mark law, is the principal question of importance for our citizens.

#### Trademarks Various Defined.

Under the laws of all the other states of the Union for the Protection of Industrial Property a mark is only valid as a trade mark in case it has been registered, or, in other words, it is not a trade mark, although capable of being a mark, until registered.

The convention is not being carried out, so far as relates to trade marks, either in this country or in Great Britain. The latter country recognizes such marks only as conform to the definition of its statutes. We, as a nation, relegate the matter to the states and the common law. The advantages of a Federal law are apparent, e. g., greater uniformity, greater certainty in adopting new marks, greater certainty of exclusive use. The subject may seem, when first presented, unimportant to us, still the nations of Europe consider it of such importance that a great part of the recent conference at Brussels was devoted to it.

#### Quality Not Maintained.

By article 2 of the convention "Subjects or citizens of each of the contracting states shall enjoy in all the other states of the Union, so far as concerns patents to inventions, \* \* \* the advantages that the respective laws thereof at present accord or shall afterwards accord to subjects or citizens. In consequence, they shall have the same protection as these latter, and the same legal recourse against all infringement of their rights." \* \* \* But section 4902 of the Revised Statutes of the United States provides that only citizens of the United States who make new inventions or discoveries and desire further time to mature the same may, upon payment of the fees required by law, file in the Patent Office a caveat. Is this a divergence from the treaty? The filing of a caveat does not grant any right to the exclusion of others from the use of an invention. It is at most a proceeding in the Patent Office, entitling the caveator to notice. Can it be said that the treaty goes so far as to require that all modes of procedure in the Patent Office open to citizens, shall be open to citizens of other states of the Union? Another and a better view seems to be that the spirit of the convention re-

quires that all means for the protection of the inventor against the loss of his invention should be open to every citizen of any state of the Union. The convention to be of service to our citizens must receive the broadest construction possible.

Under the ruling of the Patent Office the citizen of another state of the Union is not allowed to carry back the date of his invention to the date of his application in his own country. This is clearly against the spirit of the convention, since under its article 4 the period of priority is granted from the date of the first application. The first applicant, therefore, has the right under the convention to a patent, unless some one in this country is proved to be an inventor, prior to that application.

#### The Question of Priority.

It is clear that our citizens cannot secure protection in foreign countries unless our laws are so changed as to carry back the date of an applicant from one of the other states of the Union to the date of his first application in his own country.

At the meeting of the patent and trademark commission, which is being held in Chicago, New York and Washington, the questions outlined above will be considered, and the commission is very desirous that inventors and manufacturers in general, and bicycle manufacturers in particular, should give expression to their opinions on these subjects.

### PAN-AMERICAN SHIPPING CO.

New American Ocean Express Established to Facilitate Trade With Spanish America.

A regular express service between New York and Cuba, Porto Rico, Central and South America is now being operated by the Cuban and Pan-American Express company, 52 Broadway, New York, which has steamship and railroad connections to seaport and interior cities.

The excessive rates heretofore charged for "foreign express" service have been superseded by an equitable tariff suited to the requirements of importers and exporters of all commodities. Shipments may be consigned to care of the company for final despatch to the above countries. Invoice or memorandum of contents, valuation and gross weight of each package, is required for customs and consular regulations. The company is prepared to execute orders, negotiate credits, drafts and exchange, and make collections on commission. Catalogues and price lists of manufactures, etc., and all further information required will be promptly furnished upon application.

#### Rudge-Whitworth Balance Large.

The fourth annual report of the Rudge-Whitworth company, limited, of London, which was the first of the English bicycle manufacturing concerns to adopt the net price list, was issued a fortnight ago and shows a net profit for the year ending August 31, of more than \$100,000, constituting a 10 percent dividend on the shares. This is after deductions have been made to provide for debenture interest, directors' fees, depreciation, and ample reserves for bad and doubtful debts. In the balance sheets the stocks in the depots and works and the additions to plant and tools have all been valued at or below cost. The showing made by this concern is a bright ray in contrast to the reported gloom in Coventry and indicates that the foreign trade conditions are not so bad as they have been reported by the daily press.

Offices of Cycle Checking Lock Co., at 7 Warren street, New York City, have been seized by the sheriff on three executions for \$923. The company was incorporated in September, 1897, with authorized capital stock of \$250,000.

## TRADE CUSTOMS OF CHINESE

### CONTRACTS ARE ONLY VERBAL

**Agreements Are Scrupulously Fulfilled, However—Foreigners Boycotted for Non-Observance.**

The Chinese merchant is, with very few exceptions, scrupulously honest. He trades simply upon his word, and the word of another, and when once a business transaction has been agreed and entered into, it will be executed and fulfilled, so far as he is concerned, with the strictest regard to all the stipulated conditions. It is, indeed, seldom that a Chinese trader exacts a signature from another, or gives his own, to a bargain or contract. In the case of the largest orders, he usually contents himself with simply making an entry upon a memorandum sheet. Should a foreigner, however, fail to carry out a bargain he has entered into, he is immediately put into "quarantine" by the Chinese tradesmen, which suspension from commercial privileges may last an indefinite time. The offending merchant in this plight would find that he would not be able to buy a roll of silk or sell a piece of cotton. It has been found impossible for foreign tradesmen to retaliate in the same manner in the case of defaulting Chinamen; but there is really no widespread occasion for it, as such instances are few and far between. At the time fixed for the delivery of goods to the Mongolian trader, the merchandise is carefully examined and definitely accepted, if it is in strict accordance with the terms agreed upon, or rejected if the contrary is the case.

#### Important Role of Inspectors.

The larger European houses exporting from China usually have especially qualified inspectors to look after their interests, who, before shipment, rigorously examine articles of such importance as tea and silk; these officers being invariably men of great experience and perfect reliability. In other cases, the advice and assistance of a "comprador" is sought. This intermediary always speaks English understandingly, and, before the establishment of European banks at several important commercial centers throughout the empire, he was a person of considerable influence and importance. Nearly every large business house still retains the services of a comprador, who is really a make-shift banker, receiving and paying out money for those who employ him. For the important duties that he is called upon to perform he often receives a compensation as high as 4,000 taels annually. He deposits as security to his clients a large sum of money in one of the banks, and as an additional safeguard, a friend or relative of means usually acts as personal security for him in event of default. But owing to the establishment of the European banks, the commercial importance of the comprador has greatly diminished in late years, and it is only the comprador of a bank who retains his ancient powers to the full. In that capacity, he has the management of everything relative to foreign business, and often he alone can secure native customers for his employers. In a word, a good comprador is still almost indispensable to every foreign house wishing to trade with the Chinese.

#### Utility of Transactions by Letter.

In China, as in other foreign fields where national trade peculiarities exist, the merchant from Europe or America who proposes to establish a profitable business must go there himself and make himself personally acquainted with the local conditions, to meet which is essential to success. Usually, however, he

does not do this, but sends an agent with meager qualifications and limited powers to represent him, and when this is the case, satisfactory results are rarely, if ever, obtained. The foreign enterprises in China which have been the most successful have been founded there by the merchants themselves, who have carefully studied on the spot the special requirements of the markets they have desired to supply. To attempt to establish a profitable business anywhere in Asia by correspondence is futile. The hesitation, lack of confidence, and delay which necessarily accompany such correspondence affecting important transactions, result in a serious loss in time and money, and are fatal to the building up of a satisfactory trade.

### TOUCH POPULAR FIGURE

**Announcement of Monarch Prices Confirms Anticipations of '99 List of Standard Bicycles.**

Prices for the Monarch line of bicycles for the season of 1899 have just been announced. As one of the leading firms in the trade, the early action of the Monarch Cycle Mfg. Co. may be expected to have an effect in determining the policy of the smaller makers. It has been generally anticipated for some time that the popular standard price for first class machines would settle on the half hundred mark, and this has been in a measure realized by the listing of the Monarch roadsters at \$50. The Cooper Special racing machine is quoted at \$60, while Defiance roadsters will be retailed for \$35. The regular equipment of the whole line will include Dunlop detachable tires, with option of Goodrich single-tube pneumatics.

It is intimated that the company has other interesting information to impart relative to its policy for the coming year, and this may be expected to be divulged in a week or two.

#### Tire Plant Sold and Reopened.

Springfield, Mass., Oct. 31. The tire factory of the Spaulding & Pepper Company, of Chicopee Falls, was sold at auction Wednesday to Reimers & Myer, of New York, for \$17,000. On Thursday the plant was transferred by the purchasers to Noyes W. Fisk, of Springfield, the next highest bidder at the sale. The plant, which has been closed for several months, will be reopened at once for the manufacture of bicycle and motor carriage tires. The concern will be incorporated and operated as a stock company. The output at first will be small and only high grade tires will be produced. The Spaulding & Pepper Company, which passes out of existence, was incorporated in 1896 with a capital stock of \$80,000. Its owners were also interested in the Spaulding Machine Screw Company, of Buffalo, which became financially involved about the time the Spaulding & Pepper factory was closed. The plant is said to represent an investment of \$43,000. It was mortgaged for \$20,000. The price at which it was bid off is considerably less than the amount at which the machinery alone was appraised.

#### Rubber Fight in Prospect.

Hartford, Conn., Oct. 29.—The trade has followed with interest the reports of the organization of a company to fight the big rubber syndicate. The resignation of the secretary and treasurer of the Good-year plant at Naugatuck has been accompanied by all sorts of rumors. A battle between the rubber trust and a competitor might affect the price of crude rubber.

W. G. Nott Bicycle Co., Ltd., of Brantford, Can., has been incorporated with capital stock of \$20,000 to manufacture bicycles, tricycles, electric carriages, and children's steel wheeled vehicles.

## WANT STOUTER DRESS GUARDS

### AUSTRALIAN IDEAS CHANGING

**American Wood Rims Are Now Accepted But Fault Is Found With Drop Frame Equipment.**

In his annual report on the trade and commerce of New South Wales, Australia, soon to be presented to Congress, our consul at Newcastle says the only article of American manufacture in the importation and sale of which sufficient change has taken place to merit special mention is the bicycle. A year ago, very few American machines were sold in his consular district. There was then a strong prejudice against them, caused principally by the introduction by certain unscrupulous dealers of a consignment of low-grade Canadian wheels, which were sold at high-grade prices. These machines soon went to pieces and caused a reaction in favor of the heavier English makes, the belief being that the American machines were too light for the rough, heavy roads abounding in New South Wales. It was also thought that the wood rim, almost universally used on American wheels, would not stand the hot, dry summer. It is interesting to record that this prejudice is gradually being overcome, and several Newcastle dealers are now importing high-grade American machines quite extensively, and speak favorably of the willingness on the part of American manufacturers to make any alterations suggested in the structure or finish of their machines, in order to meet the requirements of the local market.

#### Women Still Prefer English Machines.

Lady riders in Newcastle seem still to prefer the heavy, unattractive English makes to the lighter and more graceful American models, but a change in this branch of the trade is looked for shortly. The consul adds in conclusion that manufacturers would do well to try to devise more effective and durable dress and chain guards than such as are now employed on American drop frame machines, that being one of the chief objections to them in New South Wales.

#### American Machines Gain Supremacy.

Cycling has become popular in and around Smyrna, in Asia Minor, in the last few years. Most of the machines sold and used there five or six years ago were of English make, but the Austrian consul there reports that American machines have been recently introduced on a large scale. He estimates that fully 50 percent of the machines now imported are American, and less than 25 percent English, while the balance are supplied by German and Belgian cycle manufacturers.

#### Eastern Tricycle Factory Burned.

The factory of the New England Tricycle Co., at Taylor, Conn., was entirely destroyed by fire October 28. The building, which was owned by J. Willis Downs, president of the company, was damaged to the extent of about \$5,000, and the stock and machinery a like amount. The loss of the building is covered by insurance, but the stock was only partly insured.

An Austrian firm is extensively advertising chainless bicycles in Belgium for \$90. This competition forced the makers of the Acatene machine—the only one which seems to have met with success in Belgium—to reduce their price from \$130 to \$95.

Ruos & Ruos have begun the erection of a bicycle factory in Doylestown, Pa.

### EXPORT TRADE CHANGING.

When our export trade in bicycles began to spread slowly in the fall of 1895 and reached three millions of dollars in value in 1896 and seven millions in 1897, the sentiment among our manufacturers was at first one of doubt and frivolity. It was considered a good joke by the majority of them, and too good to last. But they were as a rule willing enough to skim the cream of this trade so long as it should hold out. Subsequently it became of course apparent that there were good mechanical and economical reasons for the favoritism shown for American bicycles by the European public. They were lighter than any built in England, France or Germany, better at the same price and cheaper at the same quality. Still it was generally supposed that English manufacturers would quickly rally from their stupor and would fight our invaders with their own weapons. For a number of reasons, which probably have their deepest foundation in our public schools, absence of social class lines and weakness of our labor unions, this did not occur. Our exports continued to grow in volume and spread in geographical extent.

Our worst competitors have come from our own ranks. The cash sales acted as a wonderful inducement for reducing prices and soon many manufacturers who would not at home be identified with any but high-priced forms of manufacture sold quantities of bicycles in Europe at prices to compete with anybody. Many of these bicycles were a great deal better than they should have been, comparing favorably with bicycles sold for more money by the same makers in the home market. The cash made the difference, and the doubt which still existed in regard to the continuance of the trade. Naturally methods were loosened considerably in transactions which were looked upon as cleaning-out sales. During this period the European purchasers had not yet learned to understand the situation. The prices were for them a revelation, explained only on the supposition that the industry must be overproducing violently at home and was in sore straits for cash. They bought anything and everything on this supposition without much examination into quality, and the opportunity thus afforded to American makers of inferior machines was embraced with much ardor. Enormous quantities of cheap and shoddy machines were shipped to European ports on consignment and disposed of, and this has been continued up to date, although under increasing difficulties.

A dozen American makers have meanwhile established a reputation for their product in transatlantic trade on its merits. They have cut loose from the export jobbers and are entering into direct relations with retail dealers. Their European trade is probably as well secured as their home trade and their business relations with Africa, India and South America are being built up on similar lines. As time passes and foreign buyers learn to discriminate, their positions in the world markets grow more and more independent of the favor or disfavor incurred by other American exporters. The rapidly increasing trade in fittings and sundries constitutes another branch of export which does not seem to be seriously threatened as yet. It may be surmised that the reaction against American bicycles generally which is at present diminishing sales by these two classes of manufacturers somewhat, will soon settle down to a rational and careful distinction between good and bad, from which these

makers will emerge with colors brightened and ability for transacting European business enhanced.

Quite otherwise for the manufacturers of bicycles who have contributed to the flood of inferior products of which complaint is now so generally being made; these and all other manufacturers who, while not guilty of especially inferior work have been late in making their wares known, are falling under the ban of all expert jobbers as included in the general condemnation pronounced against unknown American bicycles. The reckless methods followed under the misapprehension that the export trade could not last have brought about the result which was feared and have divided all American exporters into two classes: well-known and not-well-known. The stigma already resting upon the latter class may probably be removed by intelligent missionary work so far as those makers are concerned who are qualified for competing for export trade but it would be idle to expect that the export jobbers who have heretofore been ready to pay against sight draft before shipping documents were received by them will be willing to shoulder the increased burden of antagonizing the well-founded aversion to unidentified American machines which has lately been gaining ground in Germany and elsewhere. This convenient form of trade is apparently booked for a material decrease but the result may after all be beneficial if it should induce a larger number of our manufacturers to do their export business through hired representatives and retail agencies in the same manner as in the home market. Suitable representatives would perhaps not always be easily found in the American trade as at present constituted but may be drawn from the ranks of foreign commerce and industry where men with the necessary linguistic proficiency are by no means rare.

### ORIGINAL CATALOGUES FOR 1899.

Great and telling originality in business methods can hardly be expected from more than a small minority in any line of trade, but is perhaps not even desirable in all cases. The masses look upon originality with suspicion. It must be administered to them with suavity and caution and in homeopathic doses so as not to produce too violent thinking. Probably there is nothing which goes so much against the natural inclinations of the masses as to be forced to consider anything from an entirely new standpoint; and yet they appreciate innovation to a certain extent—as a condiment, but not as a medicine. To draw the line where originality begins to nauseate and ceases to stimulate has always been the Alpha and the Omega of the art practiced by commercial people, and this art has to-day more to do with changes in bicycle construction than has any deep consideration of relative mechanical merits.

If there is any field, however, in which original methods have been supposed to be not only permissible but indispensable, it is that of advertising. Probably the supposition is not quite correct. An overdose of originality in advertising matter repels the possible purchaser as much as radical innovation in design of merchandise, if certain successful advertisers may be believed. They obtain their best results by neat juggling with ideas which were previously familiar to their public, and by massing effects in words and pictures which have before made an impression in some other way or on a smaller scale. Under all circumstances they do not exact much new thinking, whatever they do in the way of spectacular effect or appeals to the senses. If they have anything to say which absolutely requires something more than a combining of accustomed phrases, they are reduced to the necessity of repeating their efforts over and over again, each time adding a little more of the objectionable, thought-stirring message which it is the ultimate object to make the public appreciate in its entirety. From this necessity there is apparently no escape unless some article is offered which really meets a true "long felt want." In that case the want has already produced the necessary thinking and absolved the advertiser from producing it. More often, however, the seller of a new article or of an improvement of an old article must create a demand by his own efforts before he can make sales and it has been a matter for astonishment in the cycle trade how many things of merit have fallen flat on the market simply because the makers attempted to force them down the throat of the

intelligent public instead of taking time to introduce them properly.

With these and many other considerations in mind, pertaining to the extremely difficult subject of economical and effective advertising, it can hardly be considered amazing that bicycle manufacturers in their preparations for 1899 trade seem to be content with the usual style of bicycle catalogues. But when many of them not only preserve the hackneyed features of the bicycle literature of the past but also cheapen it to a degree which will be quickly noticed by the general public, the whole matter grows at once into a question of trade importance, to which must be devoted some thought. If the majority of manufacturers should follow the same policy the public would be almost certain to accept that version, according to which the cycle industry is represented as entering upon a period of decadence; but if the policy be limited to a few, those who adopt a line of action which shows more life and elasticity of resources will undoubtedly carry the public with them and will get more than their share of an undiminished total volume of business. Whether economy should be the watchword in advertising matter or not, signs of decay should at all events be avoided. If gorgeous, illuminated pamphlets be no longer desirable, something which denotes change but not retrogression should be substituted. Those who must reduce their appropriation for advertising matter must, in order to avoid odious comparison with others and with previous efforts, change the style of their printed matter entirely.

This calls for a certain amount of originality, and, as above referred to, originality is not only rare, but also dangerous if it taxes the ability of either producer or reader beyond that point where mental strain commences. The conditions are, however, fortunate for the cycle trade in this respect. Nearly every subject on that side of cycling in which the public is interested, has been threshed out. Even the chainless bicycle is a familiar topic. Sensational innovations and improvements are so styled by courtesy rather than by judgment. The cycle phraseology sounds like an old story though few connect definite ideas with the current words. From all these well-worn ingredients to concoct a palatable dish for the public would seem impossible unless at least some change is made in the trimmings, the style of serving.

The "primer" style of booklet has already made many converts, but it is chiefly an auxiliary to other advertising matter. It requires an unusually deft pen combined with the deepest insight in the subject handled and the condition of trade; qualities seldom united in one person. It is better adapted for the sundries and accessories manufacturer than for the bicycle maker. The manner of presenting an argument which is used in business "primers" may, however, be employed in bicycle catalogues with good effect. Special points in construction may be handled in a separate chapter in this style with illustrations to correspond, but the richest mines from which inspiration may be drawn for new departures in catalogue making are probably to be found in the minds of the persons who superintend the buying of material and accessories, and choose design and work-methods. A heavy draft on sincerity in accounting for the reasons why certain materials have been used, certain accessories selected and certain designs preferred, would make interesting reading for dealers as well as for the public. It would practically lay bare how deeply the manufacturer understands his own business and how willing he is to have the extent of his knowledge known, but this is precisely the reason why such style of treatment may be used only by those who are leaders. Mere imitators who might attempt to adopt the same method would find themselves debarred by their own ignorance from producing a presentable pamphlet by it. They would be compelled to fall back upon trite "specifications" and engravings of mechanical details in which the new crop of purchasers whom each new year brings forth are not interested, and which older riders are tired of discussing unless there is every evidence of sincerity in the argument.

A catalogue for agents which shall serve no other purpose than that of furnishing certain important data of construction and design by which the manufacturer is bound, supplemented by an illustrated pamphlet for agents and the public intended to explain all those points which the manufacturer considers essential to make his position as a bidder for trade understood—means a form of advertising matter which cannot be used by

everybody and which for some time would be in no danger of succumbing to the spell of sameness which has made bicycle catalogues useless as trade bringers for the past two years.

\* \* \* \* \*

While the bicycle dealers who do a legitimate and conservative business with responsible manufacturers have reported an unusually satisfactory business for the past season, there have yet been heard a number of pessimistic voices inquiring in a doleful strain when and how the extinction of the bicycle dealer may be expected. It is the same school of prophets that point to motorcycles as a means of "salvation" for the bicycle trade and advocate cycle shows as necessary for reviving the "waning public interest" which has had the remarkable result of placing the industry and the trade in a better financial position, generally, than it has occupied for years. It may be divined that all these birds of evil omen subscribe to that branch of social economy which declares that waste makes wealth and have been drawing income in the past from the wastefulness of the bicycle trade. This source of income having been drained they forthwith contend that the trade is in agony. Without entering at all into the merits and demerits of the plaint, which the trade can probably afford to ignore, it seems as if it might do some good to draw attention to at least one branch of bicycle work which is indisputably flourishing and bids fair to flourish for many years. This branch is represented by the repairman. Every year sees an increased number of bicycles in use; from 500,000 to 700,000 are added annually to those already in the hands of the public; they all require repairing after the first year of service and many of them much earlier. Thus even the meanest condition of the trade at large produces an ever-increasing field for the repairman offering him the while the most excellent chance for becoming thoroughly familiar with all lines of cycle manufacture. Even now many repairmen combine with their repair business a successful cycle retail store and nearly all of their number who are endowed with any talent for business at all, will find it easy enough to obtain an agency for a good model and make greater profit by so doing than by undertaking manufacturing on a small scale. There seems to be probabilities in this development which many exclusive cycle dealers have already perceived. Instead of meekly submitting to the extinction with which he is said to be threatened, he arranges a suitable partnership with a repairman and makes provisions for sidelines. By slow degrees a larger conception of cycle retail trade than the one which has been prevailing may be expected to spread among the trade at large from observations of ventures that prove successful, and then a new crop of cycle dealers will naturally grow out of the altered conditions. With a class of men as well qualified to perpetuate the retail cycle trade as will be the repairman who goes into the business when young, it is hardly probable that either department stores or other mixed stores will long be able to attract customers for bicycles when the new class of cycle dealers shall have reached maturity.

\* \* \* \* \*

When show promoters maintain that there is a necessity for cycle shows because the public must have a new opportunity to compare good with bad construction and find out that the cycle business is not dead, it seems odd that the same promoters consider it expedient to divert the public's attention from the cycles by means of motor carriages, which, by the way, they will find it difficult to get together. In regard to construction and finish the question also naturally arises whether the public are better at discerning or the manufacturers at concealing possible shortcomings. If the public can see more deeply into construction than the manufacturer wants them to see, then the public does not seem in much need of a show. And if the contrary is true—that the manufacturer is best at his own game—then all manufacturers and dealers whose wares are really good would be losers by a show.

## ELASTIC POWER IN FACTORIES

### The Storage Battery Promises a Saving Where the Power Requirement Varies Greatly

There is at the present time a tendency among factory owners to adopt some form of electric power for the operating of their machinery. The late advances that have been made in electric generation and in the means for utilizing electric power have begun to impress the public with the desirability of that form of power. There are now many power plants of all kinds which are operated from electric currents applied in different ways, but the most interesting use of electric power in factories and the one which most directly affects bicycle factories is the independent system of running engines and dynamos and generating electric currents which drive motors in the shops. Such a system seems at first to be a roundabout way of furnishing power in that mechanical energy is first produced through steam, then converted into electric energy, and afterward reconverted into mechanical energy to drive the milling machines, lathes and presses. It is seemingly a waste to change a form of power into some other form and then convert it back again into the original form. However, as it is economy that has prompted such a system of conversion, and as it is economy which is the most important item in a power plant, the system is more meritorious than it seems to the man who gives the subject but a passing thought.

#### An Equalizer of Energy.

It is a well known fact that in all factories, whether they be bicycle shops or not, there is a wide variance in the amount of power used and necessary at different times. All of the machines in the shop may be running at one time and may be running at the full extent of their capacity, or only a few machines may be running, and those running only on light loads. The power required thus varies as the work varies, but the power supply must at all times be able to furnish the amount of energy required when all of the machines are running heavily. Supposing that a certain factory has such machines that when all are being operated, four hundred horse-power is needed, and that for half of the time on an average only about two hundred horse-power is needed. Then about two hundred horse-power is wasted fifty per cent of the time, for the engine must be a four hundred horse-power engine and run at a waste half of the time. This condition is what has made an opening for electric power in factories.

The latest electrical development, with view to furnishing power economically, is the storage battery, and there is no reason why its advantages may not be enjoyed in bicycle factories as well as in other power plants. It can be used in connection with plants driven from a purchased current or with those in which the current is home generated. In the first mentioned system the current would come from some electric supply station and would drive electric motors placed in the different rooms of the factory, there being in some instances individual motors for certain machines and sometimes motors driving the line shafts of rooms. The current, instead of driving the motors direct, passes through a storage battery. This battery is large or small, in accordance with the extent of the plant. Suppose, for sake of illustration, that the average load on the power is two hundred horse-power, and that it occasionally

runs up to four hundred, and sometimes drops to almost nothing. At all events, the power is used only during the working hours, say ten, there being no load on the power for the remaining fourteen hours of the day. Were the current used direct, it would have to be sufficient to furnish four hundred horse-power at all times, and as electric current is bought by the year, would be wasted for more than half of the time. By using the storage battery, even though the factory were run twenty-four hours daily, the current required would have to be sufficient to furnish only the average power of two hundred horse-power. When the machines were running lightly and only part were being operated, the superfluous current would discharge into the storage battery, charging it. When more machines were put into operation and the power required run up beyond the average of two hundred horse-power, the storage battery would begin to discharge, thus supplementing the current and allowing the constant two-hundred horse-power supply to drive during certain periods machinery requiring four hundred horse-power. The fact of the machinery running less than half of the time makes the reduction in the amount of original power needed still less. During the night the entire current will discharge into the battery, charging the latter to a point which will allow it to carry almost all of the entire load during the working hours. The current needed and paid for would thus be several times less than that needed to run the motors and machinery direct.

#### Reduction of Steam Power.

In a power system, where steam is employed to drive an electric generating outfit, the storage battery is useful in the same manner. Instead of driving direct from a four hundred horse-power steam engine, a certain size dynamo is operated by, say, a two hundred horse-power engine, and the electric current thus generated used to drive the motors in the shop through the medium of the storage battery. The original power unit necessary is made much less than with the direct system and the load on the current kept much more constant.

Whether the electric current be generated in the factory or be purchased from a supply station, the storage battery offers the additional advantage of being not only a money saving auxiliary, but of being able to take, for a short time, the place of all other forms of power. This advantage is apparent in case of accident or other cause which renders the engine, dynamo or supply current useless.

#### Applied to Various Work.

A late demonstration of the utility of the storage battery and the economy derived from its use is an application to a New York office building. A twenty-five horse-power steam engine supplied with steam from a street service pipe drives a twenty kilowatt dynamo. The exhaust steam from the engine passes through an exhaust pipe properly connected to the heating system of the building. The dynamo is run in connection with a storage battery comprising 118 cells, each containing four positive and five negative plates, 10 $\frac{1}{4}$  inches square. This dynamo-storage battery system operates two Sprague high-speed elevators, on which, of course, the load is exceedingly varying,

and 500 sixteen candle-power incandescent lamps, as well as several pump and ventilating motors. The cost of the steam used in operating the plant is under \$1,200 per year, and when it is taken into consideration that this amount heats, lights and operates the elevators of a thirteen-story office building, and that it is fully \$500 less than the expense of operating any other system of equal extent, the commercial and mechanical value and economy of the storage battery is apparent. The storage battery in connection with an electric power system will yield the same results in a bicycle factory as in a street railway or office building plant. In the latter two, as well as in other power plants where it has been tried and is in operation, it has without exception made great savings in the expense of furnishing power. The example is sufficient to warrant its adoption in bicycle factories, the owners of which desire to save money.

#### Initial Expense to be Reduced.

The one point urged against the secondary battery is its expense at the time of installment. By those who desire to increase the capacity of their power plant and who consider the advisability of installing a storage battery, it is urged that the cost of the battery is such that it will be cheaper to put in another engine or otherwise enlarge the original power supply. Storage batteries are cheaper in Europe than they are in this country, and, considering the fact that their development here is a work of the last three or four years, and that the disastrous effect of litigation in the courts has been ended, the prospects for less expensive batteries in the United States is almost assured. In the meantime, however, the cost is such that the great economy of its use enables the storage battery to more than pay for its installment cost. The convenience in a bicycle factory of an electric power which is not only economical, but which allows each room, or, for that matter, each large machine, to be operated independently, is apparent. The waste of power from extensive systems of line shafts and belting is obviated, and each piece of machinery is driven when needed, and when not needed the power necessary to operate it is not wasted.

#### Trade Marks for Bicycles.

A decision was recently handed down by Patent Commissioner Duell, by which registration was refused for a word denoting a color as a trademark for bicycles. The grounds first given by the Examiner for refusing to register the mark were that the word is the salient feature of applicant's name and is an ordinary surname. To this the Commissioner adds: "It is well settled that color alone does not constitute a trademark. If a manufacturer were allowed to monopolize by trademark, the color of the package in which his goods might be wrapped or the color of the paint or enamel applied to them, then legitimate competition would be seriously interfered with. A manufacturer of bicycles may paint or enamel his bicycles any color which he may select; but such selection will not take that color from out the public domain, and any other manufacturer will have an equal right to use the same color. This right being a common one, no manufacturer can exclusively hold the right to any color as against others, and if one paints or enamels his bicycles white, yellow, blue, green, or olive, he has a right to designate them by the color employed."

#### Complaints of Export Methods.

Consul-General Cole writes from Dresden: While American manufacturers complain of the difficulties in introducing their goods into Germany, I am inclined to think some of our people at least do

not pay sufficient attention to promptness in executing orders they receive, or care in making shipments to insure their reception at destination within a reasonable time. Two complaints that have reached me well illustrate the trouble: An order for machinery given early in June last to an eastern manufacturing company has not been received, although sight draft with invoice attached was paid in August; I have seen invoice from an Ohio tool company, dated June 3, 1898, the sight draft for which was paid August 8 last, but up to October 7, there are no tidings of the goods. These delays are very provoking to the purchaser or consignee, particularly after he has long ago paid for the property, and, unless corrected, will have serious effect on American trade in Germany.

### SOLID FLOORS FOR FACTORIES

**French Embed Boards in Asphalt Herringbone Pattern—Concrete as a Foundation.**

A unique method of laying floors where great solidity is required has obtained wide application in France, and is growing in favor in some of the other Continental countries. It consists in putting down a floor, not as usual, on sleepers, but in embedding the boards in asphalt. Pieces of oak, usually about two and one-half to four inches broad, one inch thick and twelve to fifty inches long, are pressed down into a layer of solid asphalt, not quite an inch thick, in the well known herring-bone pattern. To secure a complete adhesion of the wood to the asphalt, and obtain the smallest possible joint, the edges of the pieces of wood are planed down, beveling toward the bottom, so that their cross-sections become wedge-like. It is stated that these floors are used quite frequently for the ground stories of barracks and hospitals, and that they have been laid in the numerous forts around Metz, Germany. A number of advantages are cited in connection therewith. A plan in some respects resembling this has been employed in the construction of the floors of some factories and foundries in the United States. It is similar, however, only in some of the more general features, the details being altogether different. Sleepers are employed, but instead of stretching between supports, they are solidly bedded in concrete. Upon them, planking is placed, each plank as laid being bedded in hot tar.

One of the most annoying features of many otherwise well-built factories is their poorly constructed floors. A tight, smooth, strong and durable floor is what is wanted, but in floors as commonly constructed, some of these qualities, at least, are lacking. A floor upon which heavy machinery can be placed without regard to the locations of the beams and girders is a rarity. Floors which rest upon the ground, as ordinarily built, are constantly wearing out, and are not always to be depended upon. The construction employed in the plan above outlined combines all of the desirable qualities mentioned, while avoiding the objectionable features. The surface of the ground, after the top earth has been removed, is thoroughly smoothed and rolled. Four inches of concrete is then applied, and while this is soft, locust stringers are bedded in it. These stringers are placed about thirty inches between centers. After the concrete has become perfectly hard and solid, two-inch planks of Georgia pine are laid, each plank in turn being bedded in hot tar, which is spread upon the concrete as fast as the planks are laid and spiked. The result is a floor upon which the heaviest machines can stand in any convenient position without the necessity of any special foundations. Moreover, it is water-proof, damp-proof, and no miasma

can arise from the ground through it. A floor of this kind is both cheap and solid, but an additional fact which will appeal to every factory owner and builder is that such a floor will last until worn out from the top, as there can be no decay from the under side. It is reported that floors constructed upon this general plan have been in use in some of the older European factories upwards of twenty-five years.

### PARTS MAKERS' AGREEMENT

**Fixes Prices by Unanimous Consent and Prohibits Individual Reductions—No Penalties Provided.**

The form of agreement prepared for adoption by the proposed Associated Manufacturers of Cycle Parts now in process of organization sets forth in full the plans of the bicycle parts makers. The parties to the agreement agree for a period of one year from the date of signature not to sell any bicycle parts for less than the schedule agreed upon and made a part of the form, and consent to submit similar goods to the association to be inspected and classified. They also agree that no goods shall be sent out on memoranda, nor shall any bills be dated ahead, and that no gratuity or commission shall be allowed to any customer, commission agent or purchasing agent; nor shall any other terms of sale be granted to a purchaser than those agreed upon by the association.

To secure a plan of uniform cooperation in marketing various productions of bicycle parts, it is proposed to effect a permanent organization by electing a president and secretary and adopting the rule: "All prices offered must receive the unanimous vote of those present (at the meeting to arrange the schedule) to be adopted."

With a view of meeting the competition of manufacturers who are not members of the organization, and preventing the cutting of prices at points where it is at times wholly unnecessary, it is agreed that no member of the association shall deviate from the prices and terms agreed upon, without first obtaining permission from the secretary: that his request shall give the name of the competitor making the lower price, the name of party to whom the competitor made the price, and all information as to why a change in association price is desired, and if, in the judgment of the secretary, it appears desirable to grant such permission, he shall immediately telegraph his consent to the member making the request, and shall at the same time notify every member by wire, giving each permission to name the same price to the same party, and to this party only.

### LAW POINTS ON PARTNERSHIP.

**Recent Legal Decisions of Interest to Nearly all Firms in the Cycle Trade.**

Incoming partners are not liable for the prior debts of the firm unless they expressly assume them.

Where the business for which a copartnership is formed is illegal, the contract of partnership is equally so.

A surviving partner is not entitled to have his personal exemptions paid out of the assets of an insolvent copartnership.

A partner who, after dissolution of the firm, converts firm property to his own use is liable for same with interest thereon.

Where a partner retiring from the business allows his unliquidated interest to be continued in the business of a new firm, the interest so left becomes liable not

only for partnership debts then outstanding, but also for those subsequently created by the new firm.

One is not liable for holding himself out as a member of a firm, unless the debt was incurred through reliance upon his credit.

All members of a partnership are bound by the false representations of one of the partners, made in the sale of partnership property.

A partner has no right to appropriate partnership property to the payment of his own debts without the consent of the other partners.

The fact that one partner is indebted to the other on copartnership transactions gives the other no lien upon his debtor's individual property.

A partnership may be formed by the voluntary consent of the parties, without written articles, by tacit approbation, by parol contract, or even mere acts.

One partner cannot take any business to himself, for his own exclusive benefit, that is within the scope of the partnership business, unless specially provided for.

Each partner is liable individually for all wrongs committed in the course of the partnership business, and may be sued along with part or all the other members of the firm.

The mere naked promise of one that another shall share in the profits of his enterprise, where the other furnishes or does nothing towards the enterprise is void, for want of consideration.

Where the books of a firm show that one of the partners is indebted to the firm, the purchase of his interest in the partnership by the other partners extinguishes the debt, and his liability to it ceases.

A partner retiring from a firm after the purchase of goods by it is not thereby released from liability, although the seller afterwards extends the time of payment to the one continuing the firm's business.

Where a firm dissolves by a change of its personnel, the assets of the old firm will not become the property of the new firm without specific and distinct agreement transferring title to the new partnership.

Though a partnership, as such, possesses no capacity to take a conveyance of the legal title to real estate, it may acquire in its firm name a lien on real estate to secure an indebtedness, or take same in names of the partners for the benefit of the firm.

### Boys and Girls in Factories.

The Inspector of Workshops and Factories in Toledo is enforcing the law relative to the employment of boys and girls under 15 and 16 years of age, respectively. A number of such youthful employes in Toledo bicycle factories have been obliged to leave the shop and take up study in school. In many instances the enforcement of the law works a hardship, as the bread winning power is shut off where the youth are the only support of families. Again, the law will work great good for it will take the cheaper laborers out of the factories and thereby contribute to better workmanship with all machine tools which are not wholly automatic.

## RECENT PATENTS

### Annealing Box That Provides for Expansion—Interesting Eccentric Driving Mechanism

**Annealing Box.**—It has been the inventor's object to provide an annealing box which will be durable and successfully withstand the intense heat to which these boxes are subjected, the construction being such as to provide for expansion and contraction of the top plate and prevent the top plate from sagging or buckling. In the accompanying drawings, Fig. 1 is a plan view of the annealing box with the top removed. Fig. 2 is a side elevation with one end and a part of the top in section. Fig. 3 is a cross-section through the box and top, and Fig. 4 is a detail

view showing a part of one side of the box with the top plate and its supporting ledge. The box may be made of cast or wrought iron or steel, as may be found desirable. The side sections may be in two parts, and all the sections are made with interlocking tongues and recesses and secured together by bolts connecting the parts at each joint. The sides, shown in Fig. 1, are also in section, with tongues in one section fitting in recesses in the other sections, and bolts secure the sections of the sides together at these joints. In order to brace the whole structure longitudinally, rods pass between the end plates from end to end through ears, which prevent the rods from buckling under the heat and keep them straight, the ears being located at intervals on the inner wall of the side sections. In order to support the top plate, a ledge is formed around the inner wall of the sections, this ledge projecting inwardly, and at intervals the ledge is slightly extended, and these extended portions are provided with openings adapted to receive threaded bolts. The top plate is of slightly less width and length than the opening constituting the entrance to the box, so as to allow for the contraction and expansion of the plate without buckling, and after the top has been placed upon the ledge the threaded bolts are passed down through elongated openings in the top plate, these openings allowing for the expansion and contraction; and covering the openings are small plates, which form supports for the heads, fitting on the ends of the bolts. Instead of nuts being used for this purpose, any form of fastening will do, provided it keeps the top plate to its seat. In order to prevent buckling, the top plate is stiffened by ribs, which extend crosswise, as shown in Figs. 2 and

3, being bolted by flanges to the plate. It will be noticed that the ledges are arranged below the upper edge of the sides of the box, so that sand may be filled in this space above the top plate, and this sand will cover the joint about the edges of the top plate, which, it will be seen, does not reach to the sides of the box, and in this way allows for expansion. The corners of the box are inclined, and the edge of the top plate will rest against this incline, and the sand will rise and fall as the parts expand and contract. In the contracting of the box the incline will allow the sand to slide upon it easily, and in expanding the sand will drop down, following the top plate, keeping the cracks air-tight, but not interfering with the free expansion and contraction of both the top plate and the sides of the box. The inventor is Robert A. Wilson, of Canton, O., assignor of two-thirds to H. A. Crouch and W. T. Hall, of the same place.

**Martyn's Handlebar.**—The bar is formed of two separate portions, each terminating at the inner end in cups which fit upon hemispherical surfaces of a core, to which they are confined by nuts with concave inner holding surfaces. The handlebar post, formed with a transverse cylindrical opening, in which are contained the core, the cups, and the rings. The latter are located within the ends of the opening in the post and are rendered relatively movable by splitting the post axially in the plane of the bicycle. By contracting the split portions of the post together, the rings are caused to approach each other, and thereby the cups are gripped solidly upon the core at any desired adjustment of the handles. The mode of adjusting the rings on the post is to form the rings with a screw-threaded exterior surface, which engages with an internal screw-thread in the transverse cylindrical opening through the post. The parts are assembled by first introducing the core into the aperture, then placing the cups in contact with it, and then slipping the rings over the handlebars and screwing them into the opening until they make a rather loose contact with the outer surfaces of

the cups, thereby confining the cups upon the core, but at the same time allowing them to be shifted thereon as may be desired. In order to provide for a more perfect gripping of the cups, each ring has a split, and the head of the post is also split at right angles to the split in the rings, extending from the upper extremity of the head only down into the opening. To produce the simultaneous contraction of the portions of the head formed by the splits, the head is made with an upper conical projection, composed of the extremities of the split portions, and a screw-thread is cut upon the conical projection to receive a conical

nut. When this nut is turned down, all four portions are contracted together, and the effect is to simultaneously contract each of the rings circumferentially upon itself and both of them laterally toward each other. The resulting gripping action produced upon the cups is extremely powerful and serves to clamp the cups very solidly upon the core. The inventor contemplates to have this construction utilized in conjunction with a draw bolt expander device for securing the handlebar post in the steering head of the bicycle, as shown in the illustration, but this is not essential. The inventor is Fred M. Martyn, of Woburn, Mass., assignor of one-half to James J. Freeman and Henry F. Davis, of the same place.

**Wheeler's Saddle.**—The claims allowed for this patent are six in number. Claim 1 reads as follows: "In a bicycle saddle, the combination of the broad wooden frame, the spring mounted on said frame and attached at its front and rear ends thereto, said spring having the yielding forwardly-extending portion and the curved portion near the rear end

thereof, and the leather supported on said frame and spring." Claim 6 is more specific, as follows: "In a bicycle saddle, the combination of a solid wooden frame shaped into concavo-convex form having the curved back and laterally-extending side portions and the reduced forwardly-extending neck, the back of said frame rising above the reduced forward portion thereof and having an inward curve at the center of the rear, the leather shaped to conform to the contour of said frame having at its back a central inward curve which coincides with the curve of said frame and having the central longitudinal depression leading from said rear inward curve and extending forward to a point adjacent to the pommel, the pads interposed between the leather and the frame separated to form an open space between them, the central depressed portion of the leather depending between said pads, the spring attached to said frame at the front and rear, its forward end projecting beyond said frame and attached to the pommel of the saddle leather." The inventor is Benjamin F. Wheeler, assignor to The Wheeler Saddle Co., of Detroit. The patent is numbered 613,050; dated October 25, 1898. The application was filed October 12, 1895.

**Salsbury's Driving Gear.**—In the crank bracket is fitted a tube upon which are formed cone bearings. The tube projects at both ends of the crank bracket and carries near each end an eccentric. These eccentrics are at ninety degrees to each other. Each of the eccentrics carries a strap which runs on balls interposed between the strap and the eccentric and held in place by a casing. At its ends and exterior to the eccentrics, the tube is provided with casings containing balls upon which bears the crank shaft carry-

TRADE MARK

Mention The Cycle Age

“They are after you, Mr. Bicycle Manufacturer.”

WHO?

Our Travelers!

They are looking for all manufacturers who are looking for the best in our line. We don't make cheap tubing for use in cycle construction and don't believe any bicycle manufacturer who makes a good wheel and stands behind it will consider seriously the use of inferior tubing for one minute.

# “SHELBY”

is made from the highest grade Swedish Charcoal Steel that can be obtained. “SHELBY” has the capacity and equipment to meet all demands. “SHELBY” has the reputation of making tubing of the highest standard. Catalogues and further information on application to our offices.

Mention The Cycle Age

ing two casings, of which one is capable of adjustment. On one of the eccentric straps, preferably the right one, are fitted a number—three are shown in the illustration—of revolving bowls or studs, placed at an equal distance from each other on the same circumference concentric with the strap. Onto the crank on the same side is secured in any suitable manner a disk having a number of inner hypocycloidal teeth, the faces of which are so determined and drawn as to act

upon the bowls in succession and consecutively. Finally, each of the eccentric straps is connected by two rods to the corresponding straps of similar eccentrics, mounted upon the two ends of the axle of the rear wheel and placed at ninety degrees to each other.

The motion obtained by this mechanism is explained by the inventor with reference to the diagrammatic drawing shown, as follows: It is well known that when an eccentric is revolving every point of its strap describes a circle, the radius of which is precisely equal to the radius of eccentricity of the eccentric. This being so, let it be assumed that  $s$  be the imaginary circle drawn upon the eccentric strap  $f$  and passing through the centers of the bowls  $k$   $k'$   $k''$ . Every point of the said circumference, and especially the center of each of the bowls  $k$   $k'$   $k''$ , will describe while revolving around the eccentric a circle  $t$   $t'$   $t''$ , the radius of which will be equal to the radius of eccentricity  $x$   $y$  of the eccentric. Vice versa, it is obvious that if the center of each of these bowls be caused to describe the said circle, the strap will receive the requisite motion for causing the eccentric to revolve. On the other hand, consider the center of any one of the bowls—say  $k$ —when the said center assumes a position most distant from the axis of rotation  $x$  of the eccentric and draw from the point  $x$  taken as a center a circle  $u$ , passing through the point  $k$  and therefore internally tangential at that point to the circles  $s$  and  $t$ . It will be clear that if the two imaginary circles  $u$  and  $t$  be assumed to revolve within each other in the direction of the arrows 1 and 2, respectively, the trajectory of the relative movement of the point  $k$  of the circle  $t$  with reference to the circle  $u$  will be the hypocycloid  $v$ , and that if the respective diameters of the circles  $t$  and  $u$  are suitably selected, so that the one shall be contained in the other an exact number of times, the point  $k$  of the circle  $t$  will return exactly to the starting point of the circle  $u$  after describing, in accomplishing its motion with reference to the said circle, a series of hypocycloidal trajectories which may be represented by  $v$   $v'$   $v''$  and the number of which will be precisely equal to the numeral which will express the ratio between the diam-

eters of  $u$  and  $t$ . Vice versa, it will be readily understood that if the circle  $u$  be assumed to revolve in the direction of the arrow 2 by causing the point  $k$  of the circle  $t$  to follow the hypocycloidal directrix  $v$ , the circle  $t$  will revolve in the direction of the arrow 1. It therefore follows that if within the disk  $m$  are cut teeth having a hypocycloidal profile drawn through the directrix  $v$  of Fig. 4, the number of the teeth being so calculated for a given number of bowls  $k$   $k'$   $k''$  and for a given ratio of pitch-lines  $t$  and  $u$ , the hypocycloid described by each bowl  $k$  with reference to the pitch-line  $u$  shall comprise an arc of the said circle  $u$  equal to the fraction of the said circle corresponding to the number of bowls  $k$   $k'$   $k''$  and to the ratio of the diameters of the pitch-lines  $t$  and  $u$ , and if the disk  $m$  be caused to revolve in the direction of the arrow 2, starting from the position shown, then the hypocycloidal face  $w$  of the tooth  $m'$ , will first act upon the bowl  $k$  and cause its center to become displaced according to the circle  $t$ , which movement will be imparted to every point of the strap  $f$ , and consequently to the bowls  $k'$  and  $k''$ , until the face  $w$  reaches the position  $w'$  and ceases to act upon the bowl  $k$ , which will then assume the position  $k^0$ . At that time the face  $z$  of the tooth  $m^2$  will have reached the position of  $z'$  and will begin to act upon the bowl  $k'$ , which will then have assumed the position  $k^1$ , and motion is continued to be imparted by means of the bowl  $k''$ , then again by means of the bowl  $k$ , and so on, the re-

quired teeth of the disk  $m$  thus successively engaging the bowls  $k$   $k'$   $k''$ , so as to impart to the eccentric  $f$  a continuous circular movement, the angular speed of which with reference to that of the disk  $m$  will be precisely in the same ratio as the diameters of the pitch-lines  $u$  and  $t$ . The inventor is T. G. Salsbury, of Paris, France. The American patent is number 612,995, dated October 25, and carries eight comprehensive claims. One of the chief objections to this transmission method as explained by the inventor is the small choice of gears to which the rider would be restricted with any given size of rear wheel. The system is supposed to be applicable to motor vehicles as well as to bicycles, or better.

### NOVEL SPROCKET REPAIR

**Rim of Old Wheel Is Cut Off an Inch from the Hub and New Rim Riveted to the Arms.**

A quite frequent repair on old machines is the replacement of the front sprocket, the work being made necessary by the wearing out of the original sprocket. Sometimes the work is very difficult on account of the sprocket fastening. Many old sprockets are brazed to the axle or otherwise secured so that the task of taking off the old and putting on a new one is laborious enough to take all the profit off the job. A repairer has this season replaced many such sprockets in a manner that not only affords ready accomplishment of the work, but enables the shopman to better please the patron than would be possible

by the mere duplicating of the old sprocket wheel. The method also makes it possible to put on a larger sprocket than can be commonly secured of the old pattern, and avoids all machining of stock sprockets in order to make them fit the axle.

The old sprocket is not taken from the axle, but the arms are sawed off about an inch above the hub. A sprocket of the popular type is purchased and holes drilled in the ends of the old sprocket arm stubs. The sprocket is then placed on the inner side of the old hub and rivets put through the holes. Careful and solid riveting will securely fasten the new sprocket to the hub. The rivets should be as large as the holes through which they pass in order to prevent the sprocket working loose in use. The dished side of the sprocket being turned outward will bring it in approximately the same chain line as the former wheel. The job in each instance where it has been executed has given satisfaction as it gives the owner of the machine a new sprocket which is of a late popular style and lends the bicycle something of an up-to-date appearance. A slight advance in charge may be made for supplying the new sprocket over that which could be expected for putting on one of the old style, and as the job is easier to do than the average job of sprocket replacement after the old plan, it becomes a more profitable repair for the shopman.

### WHAT IT COSTS TO FAIL

**New Bankruptcy Law Makes Cost of Proceedings Lighter—Clerk, Referee and Trustee Fees.**

Regarding cost of procedure in bankruptcy cases under the new law, W. C. Sprague writes in the Hardware Trade that it was the great expense entailed by the old laws that brought about their repeal. Under the new law, fees are moderate.

The petitioner must deposit with the clerk the sum of \$25, except in the case of a petition "of a proposed voluntary bankrupt, which is accompanied by an affidavit stating that the petitioner is without, and cannot obtain, the money with which to pay such fees." In such a case no deposit is required. Of the \$25, \$10 is for clerk's fee, \$10 for referee's fee, and \$5 for trustee's fee. The trustee, in addition, receives such commission as may be allowed by the court, not to exceed 3 per centum on the first \$5,000 to be paid as dividends and commissions, 2 per centum on the second \$5,000 and 1 per centum on the balance. The referee will receive in addition to the \$10 deposited with the clerk, a commission of "1 per centum on sums to be paid as dividends and commissions or one-half of 1 per centum on the amount to be paid to creditors upon the confirmation of a composition." Thus, in a case where the net assets for distribution amount to \$12,000, the clerk's fee would be, as in all cases, \$10, the referee's, unless an offer of composition was made and confirmed, \$130, the trustee's not to exceed \$175—a total expense for these officers in such a case of \$415.

The petitioner is allowed also one reasonable attorney's fee, to be paid out of the estate before distribution to creditors, the amount to be fixed by the court.

### Profit Due to Automatic Machinery.

After a series of misfortunes which have heretofore prevented the Alfred Appleby Twin Roller Chain Co., limited, of Birmingham, Eng., from showing a favorable balance sheet, this concern at its annual meeting, held last month, reported a profit of nearly \$7,000, as the result of the introduction of automatic machinery, by which an increase of 25 per cent in output and 25 per cent decrease in the number of employes has been attained.

# Fauber 1899 Hanger.

NEW IDEAS—NEW PRICES.

**MANUFACTURERS** who used Fauber Hangers were very successful and well satisfied.

**DEALERS** found them good sellers and bicycles fitted with them not dead stock.

**RIDERS** appreciate the simple and practical construction of the Fauber Hanger and the advantage of a standard article for which you can get any necessary repairs.

We are **Pioneers** in the manufacture of **One-Piece Crank-Axles** and own more than twenty allowed and pending patents. The **Success** of the Fauber Hanger is unparalleled in the bicycle trade.

## THE WHITNEY STEAM WAGON

### Engine Reduced to Small Weight But Wagon Details Stoutly Made—Operation Simplified

George E. Whitney, New street, East Boston, has been engaged on the steam motorcycle since 1883, although his first complete steam wagon was not placed on the road until the month of October, 1896.

Mr. Whitney was born in 1863 and comes of a family which has furnished many names well known to the mechanical world, Amos Whitney, of the machine tool building firm of Pratt & Whitney, Hartford, being his uncle, and the Whitney of cotton gin fame being in his ancestral connection.

George E. Whitney has had a long experience with small yacht engines and boilers, which involve most of the problems connected with a motor suitable for driving steam wagons. Nearly twenty years ago Whitney did some work on the first Roper steam wagon, which was a very light vehicle, weighing only 410 pounds and capable of fast work. This Roper wagon had, of course, wooden wheels and steel tires, the wire-spoke suspension wheel and the pneumatic tire being unknown in the day of Roper's first work.

#### Boiler With Gun Barrel Tubes.

Roper used a boiler 20 inches high, of only 10 inches diameter, with 63 tubes of large diameter, No. 10 sporting gun-barrel gauge, and these large tubes were only 10 inches long. Such tubes as Roper thought fit to use were not to be bought in the market in his day, and Roper made them, buying sporting gun barrels and cutting them to his length, and turning them down to about 1-32 of an inch thickness in the body, with thicker ends, which were V-threaded 60 p. i., and screwed into his boiler tube sheets, the tube sheet holes being small in one head and large in the other head, both heads being tapped at the same time with a long 2-size tap, and the flues being made with 2-sized ends, so that the smaller threaded ends of the tubes could slip through the larger tapped holes in one tube sheet and drop down to the other sheet, and then the threaded tube ends could be turned home. Roper made the threads on his tube ends taper, and did

Fig. 1.—Boiler shells, one complete and one lacking flues and steam chamber.

not expand his tubes after screwing them in, but depended on the taper threads to make them tight in the tube sheets. Roper's tubes were of too large diameter for their length, and Roper used coal for fuel, and had to stop his carriage and dismount to mend his fire, and when the fire was once made he had either to run his wagon or blow off his steam at the safety valve, as he had no way to check his fire, and, indeed, there is no way now known by which coal or coke can be burned under a road wagon boiler, so as to fill the exacting conditions under which a motorcycle steam boiler should work readily.

Whitney, in his experiments with yacht boilers, found that the single vertical

tubular boiler, with flues 26 diameters in length, produced more steam per pound of boiler than any other form of steam generator with which he experimented, and he has adopted as standard the boiler shown in Fig. 1.

#### Dimensions and Securing of Flues.

This illustration shows two Whitney boiler shells, one complete, except that the flues are not in place, while the other, lying on its side, lacks both flues and the steam chamber in which the steam cylinders are placed. The dimensions of the Whitney boiler are, total height, 20 inches, with a body diameter of 16 inches. This gives a horizontal "expansion ring" between the water-leg fire box diameter

The Whitney Steam Wagon, Side and Rear Views.

of 16 inches, and the body or barrel diameter of 14 inches. This introduction of the expansion ring in the outer shell of the boiler is advantageous inasmuch as it gives room in the fire box for a burner of the same diameter as the lower tube sheet, but its greatest use is in affording an easily bent surface, which will permit the boiler shell to expand and contract without changing the distance between the top and bottom tube sheets.

Whitney uses copper tubes, 1/2-inch diameter, and about 300 in number. These flues are first enlarged at one end by expanding, and are then V-threaded at each end 50 p. i., double threads. This gives a flue thread the same size as if the pitch were 100 p. i., making a thread so fine as to be almost invisible, unless attention is directed to it. The difference in the flue end diameters is about 1-32 of an inch only, which is abundant to allow the small end of the flue to slip through the larger holes in the flue sheet, as in Roper's construction.

Whitney makes his flue threads straight or parallel, not taper, and after the tubes are screwed into the tube sheets their ends are made tight by use of a 3-roll expander. The boiler tube sheets are tapped with a long 2-size tap, 50 p. i., double thread, straight and parallel. The boiler shell and fire box are of steel, about 1-10-inch in thickness, and the completed boiler, which weighs about 85 pounds only, is tested to 500 pounds hydraulic pressure. The steam pressure used is not high, only about 125 pounds, commonly.

Whitney's idea is, at this time, that he desires simply to know what will run best on the road. His patents and inventions are in the hands of a strong

company, and although he is now engaged on his seventh or eighth wagon, he has adopted no standard general construction. Some of the Whitney details, are, however, regarded as established, among these being the carriage frame and front axle support, the steering handle, which is very peculiar, the boiler and valve motion, the carriage springs and the wheels and wheel tires. No two of the steam wagons built by Whitney so far are alike; all have been built to order, at prices from \$1,500 to \$2,200 each, and in weights varying between 650 and 1,300 pounds.

#### Weights Gradually Increased.

It is noteworthy that Whitney began with his lightest vehicle, and has seen cause to increase his total weight to double that of his first wagon; all of these wagons have had the same motive power, so far as completed. The cylinders are 2 1/4-inch bore 4-inch stroke, and the two are cast in one piece, as shown in Fig. 2.

The two cylinders, 2 1/4-inch bore by 4-inch stroke, have no marked peculiarity. They are connected by

the walls of the steam-chest, and the valve faces, which are of locomotive proportions, stand at about 45 degrees of inclination to the steam-chest cover seat. Although Whitney's carriages all reverse and run equally well in either direction, he does not use a link valve motion, nor eccentrics.

#### Steering Assisted by Valve Action.

The valve action is taken from a double cranked shaft, the cranks having a radius equal to half the constant valve travel, and standing at 90 deg. to each other. This valve crank shaft is driven by a sprocket and chain gear even turns with the engine shaft. The engine shaft sprocket is fixed on the crank shaft, and on the valve crank shaft is mounted a sleeve, splined inside to slide endwise on

Fig. 2.—Cylinders and Connecting Rods.

a crank shaft feather, and having two spiral grooves on its outer surface, which engage two studs in the inside of the sprocket hub; the sleeve slides with a clutch-fork movement both on its spline or feather in the valve shaft, and through the sprocket hub, and thus, by virtue of

Lake, Halsted and Fulton  
Sts., Chicago.

its exterior spiral grooves engaging the sprocket hub studs, causes the sprocket to make an angular advance or retreat upon the valve crank shaft of such extent as to cause the engines to run backward or forward at will. The advantages of this valve motion, which exactly corresponds in action to the well known shifting eccentric, are the avoidance of the large sliding circumferences inseparable from the eccentric, and obtaining the certainty of a full acting valve in both directions. There is no "hooking up" possible, as with the link, and hence the engine is always full powered, and so able to handle the carriage promptly. Too much importance cannot be given to promptness of driving action for motorcycle use. In narrow crowded streets, which are the rule in Boston, it is absolutely essential that a carriage should be able to stop, back, turn and go ahead promptly and certainly, and it is impossible to realize the instant change of direction of which the Whitney carriage is capable, until after one has ridden in it. With a link valve motion and the usual notched quadrant there would be no possibility of such cockroach-like celerity of motion in any direction as exists in the Whitney steam wagon; if the link reversing lever were held by friction on the quadrant, there would still be the possibility of less than a full valve action in either direction. Mr. Whitney did not say that this certainty of valve action decided him to employ the rather unusual form of valve motion which he uses, as this point was not mentioned. But it was very evident from the behavior of the carriage that the points specified are fully obtained, and are also extremely advantageous.

#### Where Backing is Required.

As to the need of a reversing or backing action in a motor wagon, there can be no question. No wagon is safe in a crowded street which has not brake power fully up to, or even beyond, its tire resistance; the lives of the passengers may depend on a stop so quick as to call for tire destruction to check the advance, and safety of life and limb go before the safety of working parts of the carriage. Hence, first, the brake effect must be all that the vehicle will endure.

Next, the automobile, to make headway in crowded streets, must have the power to back promptly, and for any desired distance. Suppose, as often happens in Boston streets, a wagon is driven down a narrow lane between other vehicles and comes to a block in the traffic. Then if the wagon can back out promptly the way it came, without turning, because in such a situation there is seldom room to turn, it need not wait until the block is broken, but can continue its way on another street, while the drivers of the horse drawn vehicles, unable to extricate themselves, stay in the bunch—and sing hymns and discuss church matters!

Stanley, whose steam wagon was recently described in these pages, says a motor wagon does not need to back, and the Columbia parcels carrier, now just offered to the public, has no backing action. The reason is very plain; the roads about Newton, where Stanley does his experimental driving, and about Hartford, where the Pope wagons make their trial runs, carry a very light traffic, with plenty of room for all vehicles appearing. Hence the Stanley wagon and the Columbia parcels carrier are at present without a reverse action, while Whitney, whose trial drives are made in the crooked, narrow and crowded streets of Boston, is fully aware of the need of quick movements forward or backward, and has provided his steam wagon with a valve motion which enables him to go where he wishes as quickly as the strength of his mechanism permits, and even quicker, if one is to judge from certain ragged

canvas-exposing tires, hanging on a peg in Whitney's shop.

So certain of his movements is Whitney that his driving appears to be of the most reckless description, as he takes the road in front of anything, carriage or trolley car, as soon as he is fairly ahead of it, and does not check speed until he seems to be in certain collision with obstacles in front of him. Whitney asserts, however, that in all of his many thousands of miles of hard driving he has never touched anything whatever with his wagons, and after the first half hour of his driving,—Whitney and the writer up,—all feeling of trepidation on the part of the passenger vanished, and was replaced by Whitney's own absolute confidence.

Much of Whitney's certainty in driving is undoubtedly due to his steering lever. This is a horizontally swinging lever of very peculiar construction, both at its lower end and in the upper swinging arm. The peculiarities of the lower end of the steering bar arise from the movements of the front axle with relation thereto, and while highly ingenious and effective, need not be particularly described at this time. The upper member of the steering lever has, however, distinctive functional elements of great novelty and also, apparently, of the highest utility.

#### Steering Handle of Many Functions.

Whitney's theory is that in an emergency the natural impulse is to keep hold of whatever the hand is grasping; hence

Fig. 3.—Controlling Lever.

a motorcycle should combine in one handle all that is needful to control its entire round of movements. Acting on this conviction, Whitney provides the inner extremity of his steering lever with a spade-handle grip, as shown in Fig. 3, standing normally about vertical, which is grasped by the driver's left hand, and is pushed right or left to steer the wagon, and is slightly rotated to open or close the throttle valve, and is pushed a little way outward, telescoping in the lever body, to place the valve motion in forward gear, while a backward pull of this same spade handle grip reverses the engines, and starts the wagon backward. The driver's right foot is on the brake treadle, the brake being a leather faced band acting on a drum of ample diameter. At first sight this many-functioned steering lever seemed likely to confuse the green driver, but a very short observation of its use on the road made it clear that nothing could be more easily learned, or more easily or quickly manipulated. It certainly takes less time to move a piece already in the hand than is required to let go of one piece and seize another piece, and in motorcycle driving fractions of a second are often of very great importance. After watching Whitney's manipulation of this steering, stopping, starting and backing handle for a few miles, the writer reached a most favorable conclusion as to its merits. Whitney asserts that this combination handle gives him a certainty of con-

trol impossible with any other arrangement whatever, and this wide claim seems really borne out by practice. The spade handle grip is far more secure than any other form of handle, and many accidents with automotors fitted with plain horizontal steering lever grips, would probably have been avoided with the spade handle grip, simply because the top and bottom guards prevent the displacement of the hand and consequent loss of control due to a rough road.

#### Complete Operation With One Hand.

The Whitney steering lever is shown in Fig. 3. A large bell is mounted on the lever near the grip, where it can be easily operated by the thumb. This bell was very seldom used, Whitney preferring to avoid others rather than to warn others to avoid him. As all cycle riders are well aware the unexpected clang of a loud bell close at hand often confuses the oblivious pedestrian, and sometimes leads to the very result the bell is designed to prevent. But the Whitney steam wagon is under far better control than any bicycle, and can be moved half an inch forward or backward from rest with perfect certainty, and can be checked in speed within three or four feet when running at a ten-mile clip, sufficiently to place it under the instant control of the brake.

The inner side of the dash board carries a small mirror which reflects the water gauge located on the boiler under the seat, and two gauges, one showing the boiler pressure and one the air pressure in the gasoline tank, which is about 3 pounds only, and there is also a graduated quadrant which is traversed by a float-actuated index finger, and thus indicates the amount of water in the water tank. The brake is operated by the treadle seen in front in Fig. 3. This leaves the driver with his left foot and right hand free, and gives him the ability to control the movements of the wagon solely with the single lever grasped by his left hand. HUGH DOLNAR.

#### INDIVIDUAL WORKING MOTORS

Sale of Power in Small Portable Quantities Would Permit Workmen to Live in the Country.

The bicycle was the first means of individual mechanical locomotion to come into wide and general use; and its rapid, unexampled success proves that whatever mechanism can be made of service in the everyday activities and recreations of life may tap at will the stream of the world's revenues, and divert Niagaras of gold into the industries of its own upbuilding. The bicycle has marked a broad advancement in mechanical evolution, and, although its place in the economics of the future is assured, it seems not unreasonable to suppose that in time science will contrive to place in our possession and under our control something which will do for us in the way of individual power what the bicycle is doing in the way of individual locomotion. The subject instantly broadens out in the range of its possibilities until it affects, either directly or in its ramifications, nearly every phase of life and industry.

Steam and electricity create special problems as they are harnessed to the world's work, until the conviction grows in the minds of deep thinking men that they are not all-sufficient powers. Steam is a centralizer. It concentrates industry and by gathering laborers into a small compass increases the cost of living and broadens the effect of losses on sales and of distress in hard times. Some agent of decentralization seems to be loudly called for to partially combat the centralizing tendencies of steam and electricity. Smaller motors, operated by other forces, may yet prove to be the right agent. Of course it is not within the power of any material agent to effect great changes

SNELL CYCLE FITTINGS COMPANY,  
TOLEDO, OHIO.

except as it co-operates with our inclinations. The expensiveness of steam machinery co-operated with our inclinations to congregate in cities. The greater part of our growth is still, however, in the country and in the small towns. When we halt in the experiment of multiplying our great cities, our inclinations may co-operate with a motor energy which is plebeian and ultra democratic.

Let us suppose that a workman can make many of the innumerable small articles which have iron and steel as component materials. This workman has his bits of machinery and tools in his shop. They do not cost much more than the carpenter's chest of tools. He has the skill; he also has the tools; he wants the power. But a neighbor tells him that he can buy in quart or in gallon cans stored-up energy, be it of what nature it may, and that by a contrivance, which may cost little or nothing, he can attach his machinery to this democratic device and be, if he wishes, a semi-independent workman with the advantages in the gift of simple machinery. He can make many iron and steel articles in the middle of a prairie and sell them to his neighbors for cheap rent and cheap food. The divisibility of motor energy may make it the poor man's friend. You cannot buy ten cents' worth of steam power; but there is no reason why motor energy may not be sold in ten-cent packages if there is sufficient demand for it in that form. It is not impossible that the development and popularization of the "poor man's motor" may lie within the special province of the "greater cycle trade" of the twentieth century.

#### The Projected Philadelphia Show.

Philadelphia, Oct. 31.—The local Cycle Board of Trade is endeavoring to secure for Philadelphia the honor of being the first city on the American continent to promote an exhibition, the principal feature of which will be a comprehensive display of all the electric and steam-propelled motor carriages now in existence, of both foreign and domestic manufacture. President W. M. Brewster is now in correspondence with all known manufacturers of automobiles, with a view to insuring the co-operation of the majority of them. The local board is a unit in advocating such an exhibition, and its members are already enthusiastically at work endeavoring to insure its success from a cycling standpoint. Although the exact date and place were not decided upon at last week's meeting, it was the unanimous opinion that the first week in February was most suitable. The selection of a place will depend upon the tenor of the replies received by President Brewster from the automobile manufacturers. It is expected that at the November meeting of the board the full details will be announced and the preliminary work assigned to the various committees.

#### Two Whitneys Make Motorcars.

In a recent issue of this paper the name of George E. Whitney of East Boston was printed as George F. Whitney and as the latter is the name of a machine maker in Boston who is engaged in the production of an explosion engine motorcycle, the error was confusing. George E. Whitney has long been engaged in perfecting a steam wagon and has built and sold several steam driven carriages for use on common roads. His work is described in another article.

The White Hickory Wheel company of Flint, Mich., has leased Jackson Wheel Co.'s plant at Jackson, Mich., for three years and the two companies will be consolidated.

## CARRIAGE OR CYCLE DESIGN

### BUYERS' CONSERVATIVE TASTES

#### Problems of Motor Carriage Industry Preclude Anything That Looks Like Machinery.

C. E. Woods is the designer of the motor carriages bearing his name, and general manager of the Fischer Equipment company, of 110 East Twentieth street, Chicago, which manufactures them. He believes in incorporating the principles of carriage building as much as possible in the construction of motor vehicles, to the exclusion of bicycle ideas. Interviewed recently on this important subject he stated the reasons for his views substantially as follows: "The art of carriage building is very old and has been diversified to meet the many requirements of personal taste exhibited by those who are users of carriages. There is hardly a public stable today of any importance in which you cannot find ten to twelve different styles of vehicles, and the private stables of the wealthier class of carriage users run from three to six different styles of vehicles, each of which has its specific and different purpose.

"After three years of investigation among this class of carriage users I have always found the inquiry from them to be, without exception, or a perversion of the styles, luxury, finish and appearance of the vehicles to which they have already become accustomed. They demand absolutely the same diversity of design and adaptability.

#### Conspicuousness Is Embarrassing.

"This simply means that the elimination of the horse for a propelling power and the introduction of other means will not be acceptable to those who are users of fine carriages unless the change can be made without bringing with it a conspicuousness in carriage design that would be noticeable in any way to their embarrassment. In other words, the purchaser of a motor vehicle buys it for exactly the same purpose for which he has always previously bought a carriage—as a suitable means of conveyance adapted to his personal needs. The fact that it is self-propelled does not appeal to him so much as the fact that it is something in keeping with his tastes and demands, and I find that the introduction of any novelty in vehicle design is not only prohibitive of a market but is the cause for severe criticism from the users of the higher class of vehicles. There are some special features in which the motor vehicle will bear extreme originality in design, but not as a universal and general vehicle proposition."

#### Pneumatic Tires Not Necessary.

Mr. Wood's observations do not corroborate the statement heard in some quarters, namely, that bicycle construction in motor vehicles is the popular idea. "It is not popular and not practical for many reasons," he said. "Vehicles drawn by horses have required long years of experience in their general construction to make them thoroughly durable in their every particular, and when it comes to making a vehicle that is pushed instead of pulled, which runs at nearly twice the speed of the ordinary horse-drawn vehicle, and which weighs from two to three times as much, and is to operate on exactly the same roadways, we have a proposition which requires most careful consideration in its constructional features. Bicycle tubing with brazed joints and any form of cast connections has been found wholly inadequate to the requirements, even when mounted on pneumatic tires. It would perhaps be possible to design a very small and light

vehicle on the bicycle plan which might be fairly serviceable at an average rate of speed, but as a general carriage proposition it is entirely impracticable.

"What has been my experience with pneumatic tires?" repeated Mr. Woods. "It has been very unsatisfactory. The idea that they ride easier is correct in a limited sense. But pneumatic tires were designed for lightness in a bicycle and to give resiliency. For motorcycles these considerations assume a different aspect. The saving in weight disappears when the pneumatic is made as stout as required for motorcycles, and the desired resiliency is obtained through careful and proper adjustment of springs between the body of the vehicle and its running gear. Additional to this I have found that the pneumatic tire, even when inflated to its highest point, absorbs more power on the street than certain forms of hard rubber tire, so that as a general proposition I have abandoned the use of pneumatic tires in all vehicles which I have designed."

"What is the superiority, if any exists, of wood for motor vehicle construction over the all-metal theory?" asked the writer.

#### Metal and Upholstering Conflict.

"My opinion on this point," replied the man of experience, "is that it is a physical impossibility to make a motor carriage with metal as the principal material of construction without sacrificing shape, style, contour and finish. The application of anything like fine upholstery would be almost prohibitive. The special novel forms of machines in which metal is exclusively used could not be classed in the category of carriages."

Mr. Woods has built machines weighing from 750 to 3,300 pounds, and has formed the opinion that the proper distribution of weight, proper power application, and the limitation of losses in gears and means of transmission still present problems which make it impossible to determine at present to what minimum the weight of motor carriages may eventually be reduced.

#### Two Distinct Fields for Makers.

"Steam wagons, gasoline wagons, and all of that class of vehicles, have their particular field," continued Mr. Woods, "and I firmly believe will be brought rapidly to the front, but their adaptation is for commercial purposes entirely rather than personal conveyance. In other words heavy trucking and the delivery of merchandise will be their field, for the utter absence of carriage refinement in the application of such power makes it prohibitive of success in what may be termed fine carriages, either for public or private transportation."

#### M. & M. W. Co. Lose By Theft.

Manufacturers & Merchants Warehouse Company, of Chicago, has suffered losses to the extent of nearly \$2,500 through the peculations of a 16-year-old employe, who has for a long time been carrying away bicycle material and sundries, but has at last been arrested, and made a confession involving three others.

#### Bevelgere Co. Under Administration.

Receiver has been appointed for Bevelgere Cycle Co., of New York city, by Justice Pryor of the Supreme court, on application of Meyer Klein, who recovered a judgment against the company for \$140, on which \$25 was paid.

Burton, Griffiths & Co., Ltd., of London, England, are at present represented in this country by their Mr. Griffiths, who is visiting the manufacturers of Cleveland and Toledo this week.

# INFORMATION FOR BUYERS

## RAPID GROWTH IN PEDAL TRADE.

Of the increasing business in bicycle parts, the pedals of the Bridgeport Gun Implement Co., of Bridgeport, Conn., with offices at 313 Broadway, New York, have become a prominent factor. Last year the business of this company is reported to have doubled that of the preceding season, and Star and Bridgeport pedals were handled by more than 100 of the leading manufacturers and jobbers of the country. In construction the '99 Star will not differ from the '98 model, as

THE CYCLE AGE

it is believed that the previous style and grade of construction cannot be improved. The finish, however, will be even superior to that of last year. The barrels of both the Star and Bridgeport pedals are turned from bar steel, thus eliminating pressed cups and assuring perfect alignment and uniform wear on the bearings. The finish and the construction of parts and bearings are the same in the Star and Bridgeport pedals, but the form of construction in the Star reduces the leverage on the bearings to a minimum, owing to the increased length of the barrel, as shown in the first illustration herewith.

## BUNDY CYCLE AND CARRIAGE LAMP.

In the acetylene lamp of which sectional view of lower part is given, Frank E. Bundy Mfg. Co. of Elmira, N. Y., claims to have solved the problem of automatically generating the gas as it is consumed and in stop-

ping the generation at the proper time. It also claims to be sole owner of the patented rights to the use of an absorbent in the treatment of carbide with water. Details of construction are rendered plain in the drawing. The carbide cylinder unscrews and is recharged by removing the old charge and inserting a so-called "carbilot" of fresh carbide put up in a cylindrical case made air-

tight by means of lead seals at either end which must be broken open before the charge is placed over the water column in the generator. An over-pressure of gas in the generator operates through the feed cock to close the small admission valve and automatically stop the flow of water until the pressure goes down. A soft felt plug or washer is inserted in the lower end of the gas duct leading to the burner for the purpose of filtering the gas and taking out the impurities before they reach the burner. This must be removed occasionally when it becomes hard and full of impurities. The chief feature of this lamp seems to be in the formation of the "carblots," in which the granulated carbide is evidently divided into sections by circular disks of absorbent material which equalize the distribution of water to the carbide throughout the whole charge. Another feature is the novel construction of the bracket, which is of the rigid type designed for the head of the machine or for a buggy. The reflector is easily removable for cleaning by the loosening of a screw in the back. All parts are interchangeable and can be renewed at any time.

## DAVID BRADLEY CO.'S MODELS.

The truss framed America model will as usual be the leader of the concern for which E. M. Graham is superintendent and which is now known as the David Bradley Mfg. Co., 63 N. Desplaines street, Chicago, but this company will for 1899 also turn out a cheaper machine, called the Oriole and is as willing to pin its reputation to the latter as to the better known America model. In the America the one piece crank and shaft construction with which the superintendent's name has long been identified is used as well as the hubs with the easily removable sleeved axles which have for some time been distinguishing marks for the product of this manufacturing house. Both the hanger and the hubs are made with the same workmanship as of old and offer the rider superior facilities for taking apart and cleaning without any labor to speak of and with the smallest possible chance of losing balls or in other ways getting into trouble. The outlines of hanger mechan-

THE CYCLE AGE

ism and rear hub are shown in the accompanying illustrations. About the same style of hubs are used in the Oriole as in the America. The system employed for fastening seat post, handlebar post and handle bar is also the same in the two models and presents some novel points of practical value. The seat post fastening is of that kind in which the lower portion of the post, severed by a bias cut from the upper portion is drawn upward against the inclined edge of the cut by means of a drawbolt operated by a wrench applied to an octagon annular bolt head which bears against the upper end of the post. The fastening of the handlebar post is similar in principle. To secure the handlebar at any desired tilt the upper portion of the post is pierced below the split ferrule that grasps the bar, and a bolt is placed in the hole inclosed in a two-part sleeve, each of the sleeves having a segment cut out to form a wedging surface. These two concave surfaces, when drawn together by the tightening of a nut on the rear end of the bolt grip the bar securely within the ferrule. Corrugations are provided for additional safety though in reality superfluous. In both models tapered stays and forks are used. The stays are D shape from the brace down and taper from  $\frac{7}{8}$ -inch at the top to  $\frac{3}{8}$ -inch. The forks, of D pattern, taper from  $\frac{7}{8}$ -inch to  $\frac{3}{4}$ -inch. Twenty-two and twenty-four inch frames will be the stock sizes; in the former the steering head is  $5\frac{3}{4}$  inches long; in the larger frame  $7\frac{3}{4}$  inches. Hollow drop forged crowns are used in both models. The company will also market a tandem with the well-known central draft for front chain, as originated by Mr. Graham, incorporated in the design. An individuality which, while not obtrusive, plainly distinguishes the product marks all of the three models mentioned.

## IMPROVED HENLEY ROLLER SKATE.

The revival of roller skating as a popular amusement again brings before the trade and public M. C. Henley, the well known

roller skate manufacturer, of Richmond, Ind., where Henley Bicycle & Roller Skate Works have the largest factory in the world for the production of these goods. The accompanying illustration shows one of Mr. Henley's improved rink skates, which are now being manufactured in large quantities and supplied to large rinks throughout the country. By the use of rubber springs the requisite lateral motion of the trucks is obtained, thus securing to the skater the easy and graceful motion which has rendered these skates so popular. The trucks can be instantly removed by drawing back the coupling pin, which is held in position by a strong side spring, and the rubber spring may then be adjusted or replaced in a mo-

ment. The tension of the rubber springs can be graduated to suit any skater. All Henley skates can be furnished with Henley's new ball bearing skate wheels at an advanced price, if desired. The skate shown, like all others of this line, is symmetrical and elegant in its proportions, style and workmanship, and is claimed by the makers to be a thoroughly strong, practical and durable rink skate.

## BUNKER SADDLE CO.'S SIDE LINES.

The '99 catalogue of Bunker Saddle Co. is being issued from the new location of the company, at 71 Milwaukee avenue, Chicago. In addition to the several models of the well-known Rubber Neck honey-comb cushion saddles and the Bunker felt-padded and pneumatic saddles, this booklet shows several styles of tool bags, a canvas tourist's case, leather bicycle belts and leather suspenders, all made by the Bunker Saddle Co. These goods are of the best selected leather, assorted colors and well made. The claim is made for the suspenders that they will not break, wear out nor pull off buttons. The peculiar construction by which this desirable result is accomplished is shown herewith. All wheelmen who find the wearing of a belt objectionable or who sometimes ride in long trousers will be pleased to find a suspender that will not pull across the shoulders when bending over the handle bars, and which will readily adjust itself to the movements of the body without tearing off buttons or breaking away itself. Such

THE CYCLE AGE

special goods as these are among those that cycle dealers might appropriately carry in stock to increase their profits through the riding season and which customers would not expect to have thrown in gratis with machines bought.

## LOZIER BRANCH OPENED IN CHICAGO.

Temporary headquarters for a western branch office have been opened in the Manhattan building, 315 Dearborn street, Chicago, by H. A. Lozier & Co., of Cleveland, O. Permanent location has been secured at 307 Wabash avenue and will be ready for occupancy about December 1. The main offices will be on the third floor of this build-

THERE WILL APPEAR BELOW FROM TIME TO TIME TESTIMONIALS FROM THOSE WHO HAVE TESTED AND BECOME CONVINCED OF THE SUPERIORITY OF

# CLINCHER CYCLE TUBING

FRONT FORKS, REAR FORKS AND STAYS.

The Liberty Cycle Company.

Makers of

Liberty Bicycles.

Factory and General Offices.

Bridgeport, Conn.,

Oct. 21, 1898.

The Wilmot & Hobbs Mfg. Co.,

Bridgeport, Conn.,

Gentlemen:-

In reply to your inquiry of recent date would say, at the opening of the season of 1898 we had considerable call for machines built of your Patent "Clincher" .50% Carbon "Swedoh" Spring Steel Tubing, Front Forks and Rear Stays, but as we had ordered Seamless for our entire output we did not care to order "Clincher" Tubing, in as much as we had never made any tests of your tubing. However, orders kept coming in for machines calling for "Clincher" tubing, and we finally decided to send for some pieces to test same. The result greatly surprised us.

We put this "Clincher" Tubing through all manner of tests and found it, when made into frames, without reinforcements, 43% stronger than the Seamless frames made from same diameter and gauge of tubing and which had the reinforcements, and 93% stronger than the same Seamless frames when the "Clincher" tubing frames were reinforced.

Being satisfied that this "Clincher" tubing was far superior to the Seamless we ordered enough for several machines and put them on the road, giving them the hardest usage possible, and as they stood up all right we decided to order enough of your tubing for 500 machines, and before the close of the season we had orders for and sold 800 machines made of your "Clincher" Tubing, and are pleased to say we have not yet had a single complaint, although many of them have been ridden thousands of miles. We find this "Clincher" Tubing more accurate in size than the Seamless and the surface is so much smoother that we have had less work in finishing it for enamelling.

We are satisfied with your tubing and consider it the best for bicycles and have given you our order for 1899. You are at liberty to use us as reference at any time.

Yours truly,

The Liberty Cycle Co.

*J. Schrader, Supt.*

No cycle manufacturing company is represented \* \* through its stock holders or directors, or in any way in the company making the "CLINCHER" product. \* \*

What cycle manufacturer has not wondered why deliveries have been delayed on his specifications for TUBING, FORKS or STAYS and finally, perhaps, only to receive inferior products?

Does the cycle manufacturer who is connected, directly or indirectly, with the manufacture of seamless tubing products, receive any advantage over his less fortunate competitor in the cycle manufacturing business? Do not all need more than one string to their bow?

**A WORD TO THE WISE IS SUFFICIENT.**

Hundreds of high-grade cycle manufacturers in America and Europe have already thoroughly tested "CLINCHER" Cycle Tubing and are convinced of its superior strength as compared with any other product heretofore commercially produced, and are prepared to give their trade their choice of cycles whose frames are constructed from "CLINCHER" products or seam-

less tubing, notwithstanding the fact that the discount offered on the "CLINCHER" Tubing list is 70 per cent, while that on seamless tubing, the lists being the same, has been commonly advertised as 75 per cent.

Do not be misled by the claim of certain few leading makers of seamless tubing that practically all other tubing products are of inferior grade and cheaper.

**The Wilmot & Hobbs Manufacturing Co.**

BUSINESS ESTABLISHED 1877.

Mention The Cycle Age

BRIDGEPORT, CONN.

ing and will be open the year around, while during the selling season a display and sales room will be opened on the ground floor. This branch house will be the distributing point for Cleveland bicycles for the middle west and by carrying a stock of machines in Chicago it will not only be possible for the company to economize in the matter of expressage by shipping machines in carload lots to Chicago, but to also make quicker deliveries west of Ohio. The new branch is in charge of James Levy, for several years local retail sales manager for Sterling Cycle Works, and the offices to be opened at 307 Wabash avenue will be fitted up in part with the fixtures and some of the furniture of the elegant offices of the Sterling Cycle Works, recently removed to Kenosha, Wis. Manager Levy contemplates establishing Cleveland agencies in the several outlying sections of the city and in many of its suburbs.

#### FOX REVOLVING ASSEMBLING STAND.

Manufacturers of bicycles who have long sought machines for more quickly and accurately assembling wheels have pointed out the saving of time that can be effected by making the assembling stands with revolving tops so that the workmen will not have to walk around them as the work of setting up the nipples progresses, and have suggested that the arms which hold the rim in place should have sufficient pressure to force the wood into a true circle. Recognizing the importance of these features, the Fox Machine Co. of Grand Rapids, Mich., has brought out the ball-bearing stand here illustrated, in which are retained all of the good features of its old machine, while a number of improvements are incorporated

in its construction. In this new machine the company is enabled to put in twenty arms so that it can be used successfully for 40-spoke wheels. The top disk, which carries the expanding arms, has a groove turned in its periphery with radial slots milled in its face to receive the arms. The pin or pivot in the arm fitting into the groove in the outside of the disk, insures a perfectly concentric bearing, and as every one of the arms is milled to a template, they are bound to come true when expanded. The arms are expanded by means of a hand wheel, shown below the disk, which is attached to a coarse pitch nut, the upper face of which carries balls that reduce the friction between the nut and the expanding wheel to a minimum and enable the operator to get a heavy pressure on the rim and hold it true even if it was warped before it was put into the machine. The sleeve which carries the head of the machine is mounted loosely on the spindle so that the hole can be revolved to bring the different spokes in front of the operator. The top of the spindle is bored with a Moss taper hole to carry the spindle that is inserted in the ball-bearing of the hub. Four arms are bolted to the disk and carry dowel pins at their tops to hold the spider which centers the top of the spindle, thus relieving the spindle from the strain of the spokes as they are drawn up from different directions. Enough free space has been left around the arms so that the operator can readily get at the spokes and nipples to set them up. With each of these machines is furnished a lightning screw-driver which enables the operator to tighten the nipples very rapidly. While the company does not claim this to be a wheel truing machine, it says from experience that if the rim is true when it is put on the machine and all spokes are drawn up with the

same tension, the wheel will be true when it comes out and will not need to go on the truing frame.

#### CALCLITE GAS LAMP

An acetylene gas lamp of very simple construction is made by Calclite Gas Lamp Mfg. Co. of Washington. It consists of a cylindrical casing containing an upper water chamber and a lower generating chamber. In the water chamber is a needle valve which carries the regulator for governing the feed of water, and in the lower chamber fits the carbide holder or carrier hav-

ing the central porous distributing column, which is directly under the feed opening in the division wall. By this construction the manufacturers feel confident of having accomplished a regular feed and distribution of the water, a steady light of any desired brilliancy within the limitation of the lamp; and avoidance of all danger of explosion, as no pressure can ever be exerted in the generating chamber.

#### CHISHOLM & DAVIDSON CONFIDENTIAL LIST.

A small confidential price list for manufacturers only has just been issued by Chisholm & Davidson Co., factory agents, with general offices at 220 Broadway, New York. In this small booklet is catalogued everything necessary in the construction and equipment of bicycles, but all prices are given in letters of a code and a separate key is furnished only to persons in the trade who are entitled to trade prices. Notice is given that these factory prices are subject to revision from time to time, and customers are advised to make inquiries. Among the novelties carried by this concern may be mentioned crowns, head-pieces, hanger shells and connections for 30-inch-wheel models; detachable dress guards laced with braid or silk and having patent quadrants attached which are neat and simple and do away with loss of time in lacing; also the Frederick adjustable handle bar in which the grips are always at the same angle regardless of their height with relation to the head of the machine. A "brand new" hand truer for the use of wheelmen is also offered in gross lots and the claim is made that nothing like it has ever been offered to the trade. The full line of goods for bowling alleys carried by this firm suggests a sideline for dealer that should prove profitable in a season when almost all cycling clubs are turning their attention to indoor amusements.

#### PAUL HIEKISCH'S BICYCLE STANDS.

A variety of cycle stands for store and home use are made in Decatur, Ill., by Paul Hiekisch. One of these is a stout steel folding frame which receives the axle ends of the rear wheel, leaving the latter free to revolve, so that customers may try ma-

chines in the store or the rim and spokes may be readily wiped free from dust. It is also convenient for traveling salesmen. An extension attachment is furnished for this stand so that by the use of two, with extensions attached, the machine may be supported by both axles about three feet above the floor for better display. A tray covered with felt is designed to fit in this frame just beneath the wheels of the bicycle, where it is in convenient position to receive fittings, tools, etc. By means of a roller attachment, the original stand without the extension, can be converted into an inexpensive home trainer. In the accompanying illustration is shown a new stand designed to be screwed

to the floor, where the tire of either front or rear wheel is pushed into the yokes and the machine is held upright. The lower yoke is adjustable on the upright tube and the upper yoke is stationary on the bent rod, which telescopes into the tube, thus making the stand adjustable to any size of wheel. This stand is simple, effective, strong and occupies a minimum of space.

#### OTIS THIRTY INCH WHEEL MODEL.

One of the first concerns to put out 30-inch-wheel models was Otis Bicycle Co., 114 Dearborn street, Chicago. A large number of these machines, having  $4\frac{1}{4}$  inches drop of hanger and 3-inch heads have been in the possession of riders for more than two months, and Otis Goddard, president and manager of the company, states that he has experienced no trouble through broken forks or heads and that the interest in these models seems to be growing. This model will be pushed vigorously as a leader by the company, which will make very few changes in its other models for the coming season. The heads of the 30-inch wheel machines are electrically welded stampings from 16 gauge tubing, with long internal fish-mouth reinforcements at the connections. A section of tubing is brazed into this head to give it additional strength and the steering stem of the front forks is of heavy gauge tubing to withstand the stresses imposed by the use of the large wheels. An arch crown is used in the rear forks to accommodate a narrow tread and make possible the use of the Ewald one-piece eccentric hanger, but the stays are continued double to the seat-post cluster, being cranked just above the tire to run parallel.

#### HODGMAN LINE OF TIRE SUNDRIES.

The price list of Hodgman bicycle tire sundries for '99 is being distributed. The prices quoted are subject to a discount to the trade only, and these discounts are made known only upon application. Owing to the great fluctuations in the cost of crude rubber, the company reserves the right to change the prices without notice. The line is comprised of plugs, cements, tire tape, repair outfits, valve stems, elastic luggage carriers and trouser guards, waterproof rid-

ing capes weighing about 36 ounces and folding into a bag 10x6 inches, and vulcanizing patches. These last are shown in the accompanying drawing. They are for the repair of single-tube tires and have strings attached for holding them after they are inserted in the tire until they are vulcanized into place. They are made in 1,  $1\frac{1}{4}$ ,  $1\frac{1}{2}$  and 2-inch sizes. Among the Hodgman special flat-headed plugs is shown the large double-stem emergency plug with cloth back for repairing large cuts and rents which is also represented herewith.

#### PREPARING TO PUSH REMINGTON CYCLES.

Announcement is made by Remington Arms Co., of Ilion, N. Y., that the manufacture of Remington Standard bicycles will be continued on an enlarged scale and that a standard of quality consistent with the reputation of the firm as makers of fine firearms and sewing machines will be strictly maintained by careful supervision in the factory. The Remington bicycles will retail at the popular prices for '99 and the company is preparing for a larger sale of these machines than it has ever had before. The traveling force has already been increased so that it is now sufficiently large to enable the Remington people to submit their new samples to every prominent dealer from Maine to California and from Canada to the Gulf.

#### TRANSFER NAMEPLATES IN SMALL LOTS.

For dealers who handle some model of bicycle under their own name or wish to advertise their agency on all bicycles which go out of their establishment, and also for bicycle builders who turn out only from fifty to three or four hundred bicycles per year, the Meyercord Decalomania Transfer company, Chamber of Commerce, Chicago, makes a special offer in their 1899 catalogue in the form of blank transfer nameplates which are susceptible of a great many variations in color effects and contain a mortised space where any legend may be inserted which the dealer or builder may desire. The company keeps these designs made up in stock in large quantity and is

prepared to supply them in small lots with the required variations almost immediately upon receiving orders, says the catalogue.

**WARREN COMPANY'S LEATHER GRIPS.**

A rapidly growing demand for their leather grips is reported by J. J. Warren Co., of Worcester, Mass., manufacturers of a complete line of fine leather and canvas goods, including bicycle tool bags, touring bags to fit in the frame, etc. The grip has a hardwood foundation bored to admit the handle bar, and grooved to receive the seam of the leather. The solid leather covering is made

of two pieces, formed under pressure in a die so that they fit each other and the core perfectly; they are glued, and strongly stitched together, and the seam is carefully trimmed and rubbed down smooth into the groove in the wood. The nickel plated brass ferrules are glued, forced on and then pinned, and will stay. Thus made, of material of superior quality, these leather grips are of attractive appearance, agreeable to the hands, and exceedingly durable. They are furnished in variety of colors.

**MAKE THE RICHMOND FLYERS.**

Reynolds & Gross, bicycle manufacturers and repairers, have removed from 175 Michigan street and taken over the former repair business of B. F. Benson who is going out on the road for Ames & Frost in November. Reynolds & Gross will continue the manufacture of the Perry cycles in their new location and will make in their own name the Richmond Flyer bicycles, which they made on contract last year, having purchased all the dies for connections, etc. Manufacturing to contract will also be continued.

**ASBESTOS TOPPED LAMP WICKS.**

The Jackson Wick Co., of Cleveland, O., is making lamp wicks of cotton with asbestos tops. The flame consumes the oil, but leaves the top of the wick clean and even. This makes trimming wholly unnecessary and the flame always burns evenly, so that smoking is obviated and the disagreeable duty of cleaning the lamp frequently is made needless. The company contemplates making these wicks for oil cycle lamps and if they are well received will push their sale the coming season. This seems to offer a means to manufacturers of kerosene cycle lamps to remove at a nominal expense one of the objections that have been raised against these goods.

**INSTALLING A BILLET PIERCING PLANT.**

A billet piercing mill costing about \$50,000 is being put in at the Shelby Steel Tube Co.'s works in Shelby, O. With this machine the company will be able to buy solid billets of steel instead of hollow ones. By doing this the high tariff on hollow Swedish billets is avoided and thousands of dollars will be saved every year.

**KLEINSTEUBER'S SPRING GRIP.**

The spring grip construction shown below is the invention of Munroe A. Kleinsteuber, 151 Cherry street, Milwaukee, who, lacking

the time and facilities for its production on a commercial scale, wishes to dispose of his patent. The drawing represents a handlebar in which the end of the metal tube has a swaged reduction, to provide clearance for yield on the part of a grip in spring connection therewith; but the handle-bar may be of solid material, such as wood, shaped at each end to provide the clearance. While a preferred form of spring connection is shown, the invention contemplates any spring connection that may be found most convenient or desirable; and it may be pre-

ferable to employ the stiffest spring with the handle-bar having the greatest drop, and the tension may be varied as styles of handle-bars, but it is the intention that the spring resistance shall always be sufficient to prevent undue yielding of a grip in the grasp of a mounted rider. As a matter of detail, a sleeve constituting a grip-lining is shown. This sleeve is used for the reason that grips as ordinarily made are not sufficiently stiff for the purpose.

**EASTERN BRANCH FOR VIKINGS.**

R. D. Allger, Jr., for four years engaged in the retail cycle trade in New York City, gave up his retail agency for Pierce cycles and wholesale agency for Viking bicycles, at 58 Pine street, in that city, on November 1, to become manager of the eastern branch of Viking Mfg. Co., of Toledo, which will be opened in New York about December 1. It is the intention to make the latter a wholesaling depot covering the territory including eastern Pennsylvania, New Jersey, New York and the New England states.

**TOLEDO TUBE CO. EXPANDS.**

Toledo Tube Company has enlarged its capacity by moving into the two buildings formerly occupied by the Great Western Pin company. The company has two floors in each building, which are 60x160 and 40 by 140 feet. A nickelplating plant has been added and in addition to the manufacture of tubing handle bars, seat posts and other parts will be made. In the neighborhood of 100 men are employed getting out export orders for Copenhagen, Berlin, Denmark and London.

**COE MFG. CO.'S PRICE LIST OUT.**

The 1899 illustrated price list of Coe Mfg. Co., 50 Warren street, New York, is just out and is being sent to the trade. The catalogue embraces several lines of cycle accessories bearing the company's odd trade-

mark, which signifies perfection of finish on popular priced goods. Among the articles shown are the three styles of toe clips, called Nonpareil, Unity and Racer; the Hercules coaster, and the Boulevard cycle stand, shown in the accompanying drawings. The Unity clip has the lower portion extended rearwardly and provided with two bolts and a curved auxiliary plate to clamp around the barrel of the pedal instead of to the side plate. The racer has a broadened upper part to hold the foot against side slipping, and one clip attaches to the side plate by means of two bolts, which prevent turning in the pedal. The cycle stand consists of a stamped plate to be screwed to the wall and a wire spring bent into the shape shown to receive the tire of a bicycle and hold the machine upright.

**KOKOMO TIRES IN LARGER QUANTITIES.**

Kokomo Rubber Co. announces that it is now prepared to fill orders more promptly than ever, having completed an addition to its plant which doubles its facilities for turning out goods. The Defender Special tire has gained such popularity during the time it has been on the market that the company will continue to make it the leader of the Kokomo line for 1899.

Vittorio Ferrari, importer of American cycle novelties and specialties in Milan, Italy, writes to correct the statement in Cycle Age of September 29 that Joseph H. Boetti had been appointed American purchasing agent for Pietro Fabbre. It is now stated that J. H. Boetti is in America only to purchase exclusively for Vittorio Ferrari, while Fabbre & Gagliardi have made all their purchases direct from manufacturers or merchants.

Traveling salesmen for the Viking company of Toledo have been assigned as follows: Ollie Bernhart, Ohio; W. F. Gouty,

New England; Herbert Draper, Iowa, Minnesota and Wisconsin; A. B. Kaufman and Will Sullivan, the South; R. D. Allger, Jr., New England and New York City; W. P. Laing, Illinois and Missouri; Howard French, Maryland, Delaware, New Jersey and Eastern Pennsylvania; W. H. Shell, Nebraska and Kansas; George Yokom, Michigan; Harry Myers, Central States; James Wright, Montana, Oregon and Washington.

Fitchburg, Mass., Oct. 31.—The strike at the factory of the Iver Johnson Arms & Cycle Company has been settled and the men reported for work today. The employees of the company went out several weeks ago on the announcement of a cut in wages. The men in returning to work accept a reduction, but not so large a one as was originally announced. The end of the strike is welcomed by all classes, as the Iver Johnson pay roll is an important factor in the prosperity of Fitchburg.

Demorest Mfg. Co., of Williamsport, Pa., is among the cycle manufacturing concerns which have made a gratifying success of their foreign business. The company is at present giving most of its energy to filling foreign orders, and Manager McDonald traces most of this business largely to advertisements in Cycle Age, to which the foreign buyers refer.

President W. E. Miller and Secretary W. S. Miller, of Shelby Tube Co., were in Toledo last week, looking over the Toledo plant of the company. Some improvements will be made, among them being the addition of a dry retort oven for annealing tube with exposure to the air and piercing and rolling machinery.

Snell Cycle Fittings Co. will manufacture the Falcon for Tillotson Eros. The machines will be assembled by the Tillotsons in a portion of the old Yost plant. The owners of the Yost plant have not yet found tenants for it.

Cups, cones and dust caps for the D. & J. hanger, made by Park City Mfg. Co. of Chicago, are made by the Grant Ball company, of Cleveland.

**TRADE NOTES.**

A stock company of prominent business men has just been formed in Richmond, Ind., to operate a roller skating rink. A large building erected for the purpose has been leased for a term of years, and will be fitted up in first-class manner. The skating capacity of the building is large, allowing from 750 to 1,000 skaters on the floor at one time.

The Outing branch in Louisville, Ky., has been bought out by Karl Thome, who will conduct the business independently. A. L. Ray, the former manager, will go to Bay City, Mich., to become superintendent of agencies for National Bicycle Mfg. Co.

Louis E. Dettman, of Marinette, Wis., has begun the manufacture of a number of bicycle sundries, including rubber, wood rim and plugging cements, enamel polish, tire fluid and grapho-lubricant for chains.

Harry L. Palmer has gone on the road again for Ames & Frost Co., of Chicago, to sell Imperial bicycles in New York and the New England states, which territory he covered last year with success.

Philadelphia Bicycle Co., Fifteenth and Alter streets, Philadelphia, sustained damage to the amount of \$2,000 in a recent fire which destroyed the building in which it was located.

The branch house of H. E. Cowles in Burlington, Vt., has been bought by the former manager, Elmer Dyke, who will hereafter conduct the business for himself.

Albert Dudley, of Menominee, Mich., is preparing to begin the manufacture of a new tube cutting machine which he recently invented and has patented.

Hedley Salmon, who has held the agency for Rambler bicycles in Denver for several years, and is one of the best known dealers of that city, died October 24.

J. S. and H. C. Starr, of Decatur, Ill., who make vehicles and harness and sell bicycles and sewing machines, have removed to Fort Worth, Tex.

John H. Schaal, of Chambersburg, Pa., has begun making bicycles on a limited scale for local sale.

A new building is being erected in New Knoxville, O., to be occupied by Mech Cycle Works.

# THE PASTIME AND SPORT

## Bald a Changed Eddie.

New York, Oct. 31.—A pensive, absent-minded, heavy-eyed young man, with traces of former beauty and a once athletic frame bowed beneath the weight of "lines," and "cues," and "entrances," has been wandering around the corridors of the Marlboro and along the Rialto for the past three weeks, at times mumbling to himself incoherently and occasionally turning pale and quaking as with ague. One would hardly recognize in him "Eddie Cannon" Bald, champion bicycle racer of America. It is indeed our own Eddie—but not the bright-eyed, cheery,

rel" on the stage trod with so much histrionic glory by the Great John L., Pompadour Jim, Freckled Fitz, Steve Brodie, and Chuck Connors.

## Foreign Riders Sign With Kennedy.

The management of the Madison Square Garden meet received a cable dispatch last Monday from J. C. Kennedy, in Europe, announcing that the following foreign riders have signed with him to enter the six-day race: Teddy Hale, of Ireland, winner of the race in 1896; Stephane, of France, who competed last season; Frederic, the Swiss rider, who took

## Taylor's Plans Balked.

Philadelphia, Oct. 31.—Accompanied by a complete battery of pacing artillery, Major Taylor arrived here about the middle of last week. It appears, however, that his employers, after selecting the Willow Grove track for the creation of new figures, failed to make arrangements with its owners, the Union Traction Company, and when the colored wonder went to the track he found it closed. Manager Weaver explained that the track had been closed for the season and that the company had no idea of reopening it and going to the expense of employing watch-

chatting, devil-may-care Eddie of the circuit. The responsibilities of the selection of a leading lady worthy of the love, heroic self-sacrifice, and record-breaking speed of the handsomest of champions, weighed heavily upon him for some time. Then came the memorizing of hundreds of "lines" that haunted him by day and night and made of him a mumbling mummer. The terrors of rehearsal under the unappreciative direction of a stern stage manager followed. With all this passed through, the thoughts of that awful first night palsied his athletic limbs with stage fright. And so it is that our Eddie has not been happy and was hardly recognizable for some time to his friends and admirers. But it is all over now. Tomorrow night, at Binghamton, he will make his debut as the hero in "A Leaf of Lau-

second to Miller in the 72-hour race in Paris; Joyeux, of France, and Pat O'Halloran, an Irishman of considerable reputation as a long-distance rider. Maurice Cordang, who holds the world's record of 618 miles in twenty-four hours, is also expected to enter. Opposition to the race by the L. A. W. consulate and the Associated Cycling Clubs of New York seems to have died out, as no further move has been made by the committee delegated to draw up articles for a new ordinance to be submitted to the board of aldermen.

James Drury, with indifferent pacing by one tandem and a triplet, on October 29, at Montreal, succeeded in lowering the Canadian amateur flying start record from 1:53 to 1:52 1-5, and the standing start record from 2:03 to 2:01.

men and running its electric light plant (lights being necessary in the training quarters). Major and his pacemakers were therefore compelled to come back to town. It is understood that Woodside Park will now be selected, but it is whispered that the managers of that track contemplate getting even with Major for the "throw-down" he gave them on the occasion of the last National circuit meet in this city, and will also close their gates to him, in which event he will be compelled to go elsewhere to break records. The marks he is after are all for short distances, including the quarter, third, half and mile

## Taylor Practicing Behind Motocycles.

Our Business Is Built Up By  
**Satisfied Dealers**

\*\*\* HUGHES, WOLF & MILLER \*\*\*

DEALERS IN

Clothing, Shoes, Jewelry and Bicycles.

TERRE HAUTE, Ind., Oct. 3, 1898.

NATIONAL CYCLE MFG. Co., Bay City, Mich.

Gentlemen—As our '98 season is now over, we take pleasure in stating a few facts. We have sold 274 National wheels this season. Of these one frame showed a slight defect in brazing at the seat-post connection and another had a clamp lug on the bottom bracket broken both were repaired free of charge. We have broken only one fork side, one crank and can hold in one hand all the cups and cones which we have replaced. Haven't had a broken fork crown, a broken crank axle or a broken front or rear wheel axle.

This is a record that we can all be more than proud of. Detective wheels cause many a gray hair to come in the retailer's head, as if a rider has any trouble he comes into the store and turns himself loose like a cyclone.

We feel more than pleased with Nationals this year and hope that our business relations will be as pleasant in '99 as they have been in the past four years. With best wishes, we remain, yours truly,  
HUGHES, WOLF & MILLER.

**SUMMARY.....**

- Nationals sold, 274.
- Frames broken, none.
- Fork Crowns broken, none.
- Front Forks broken, none.
- Fork Sides broken, one.
- Crank Axles broken, none.
- Wheel Axles broken, none.
- Cups and Cones broken, very few.

where he is training for the coming Madison Square Garden races behind men-driven pacing machines and Henri Fournier's motor tricycle, which has created a considerable sensation in New York on the asphalted streets and boulevards since its arrival. Taylore told the Cycle Age representative that the motor tricycle made an ideal pacing machine, having all the speed necessary and a fine "draft." A motor triplet is expected over here before the Garden races. There is talk of races between men motor-paced and man-paced.

### LEAGUE OFFICERS SUED

**A. C. R. A. Brings Action Against Potter and Mott for Alleged Libel in Warning to Foreigners.**

New York, Oct. 31.—Albert Mott, Isaac B. Potter and Henry Sturmev have just had a suit for \$25,000 for damages for libel brought against them by the American Cycle Racing Association for the warning issued in a racing board bulletin to foreign riders against participation in the coming unsanctioned six-day race, with the added advice to get payment in advance for any remuneration that may be offered them. Sturmev's complicity in the alleged libel is rather foggy, as it does not clearly appear that he printed the warning Mott announces he sent to him for promulgation by the International Cyclists' Association. In any event, he can probably shift the responsibility onto the L. A. W. officials.

The A. C. R. A. has given out the following statement as to the suit:

The institution of this suit is the culmination of a series of attempted interferences on the part of Chairman Mott with our operations in cycle racing. So long as the attacks on us were confined to minor matters and did not seriously hamper our meets we paid little attention, but when in his recent communication to Henry Sturmev, the Secretary of the I. C. A., the League chairman tried to injure our standing and credit with the European associations and racing men, we decided that it was about time to interpose an objection of a decided nature. The explanation of the attitude of Chairman Mott and President Potter toward our association lies in the fact that we are charged with having been responsible for the recent breakaway of the leading riders from the L. A. W. The untruthfulness of this charge is plainly apparent to those who are conversant with the real facts connected with the declaration of independence on the part of the racing men. We shall continue to promote meets, and as soon as a new organization is formed we will apply to it for sanctions whenever we have occasion and also observe its rules and regulations. The suit against the League officials personally will be forced to an issue, and our lawyers believe that the strongest kind of a case is in their possession.

### ENGLAND DEFEATS FRANCE

**Linton and Armstrong Win Fifty-Kilometer Team Race From Bouhours and Champion.**

Paris, Oct. 21.—The fifty-kilometer international race between Armstrong and Linton, representing England, and Bouhours and Champion, who defended French interests, took place at the Parc des Princes track last Sunday and resulted in an easy victory for the British champions. The men were paced by electric tandems. Champion, on the outside, was the first to break the line and secure a lead of some fifty meters, but his pacing machine was slow in getting off and he quickly fell to the rear and lost 200 meters, Armstrong and Linton taking the lead, with Bouhours third.

At the fifth kilometer an accident happened to Armstrong's tandem, and three laps later Linton's men had to stop. Taking advantage of these mishaps, the Frenchmen sprinted and, amid deafening cheers, passed their opponents. Linton for three rounds was without pacemakers, and at the tenth kilometer was lapped by Champion, who had covered the distance in 11:50 2-5. At the twelfth kilometer Champion, who was beginning to show

signs of distress, was caught and passed by Armstrong, Linton (one lap behind) and Bouhours. Armstrong's time for the twenty kilometers was 23:35.

Champion was lapped by Armstrong at the twenty-ninth kilometer, and, with Bouhours weakening and Linton having made up the lost ground, the Englishmen had the race from this point virtually at their mercy. The thirty kilometers were covered by Armstrong in 35:11 4-5, and the forty in 46:54 3-5, he being at this period of the race two laps ahead of Linton and Bouhours, and two and a half laps in front of Champion. At the forty-first kilometer Linton left Bouhours, and, putting on a fine burst of speed, caught and passed Armstrong. The latter, however, had the best of the final laps, and eventually won in 58:42 4-5, Linton being second, Bouhours third, and Champion fourth.

### UNION APPEAL TO I. C. A.

**Bald Presents Racing Men's Side of Secession to Secretary Sturmev and Asks Delay.**

President Edward C. Bald, of the American Racing Cyclists' Union, has sent to the International Cyclists' Association the following statement, which is interesting and comprehensive, as it sets forth in full the present racing situation in this country as viewed by the leading professional racing men:

New York, Oct. 26, 1898.

Mr. Henry Sturmev, Hon. Secretary International Cyclists' Association, Coventry, England.

Dear Sir: \* \* \* This breakaway from the L. A. W. has been contemplated for some time by the professionals, owing to a government of the sport which has been far from satisfactory, and coupled with the fact that the organization which controlled us, while admitting other wheelmen to membership, declined to open the doors to us, the assertion having often been made in national assembly debates and in print that we were undesirable as associates. Nevertheless, we have been taxed, fined and punished by this body, which, while affecting to despise us, has profited by its self constituted authority over a sport in which it has no financial interest at stake, and which it uses as a political football in the annual elections, the remunerative offices going to the faithful for services performed.

Sentiment in the L. A. W. for a long time has been growing in favor of relinquishing racing, until now the majority appear to be desirous of divorcing the two. Naturally those who are occupying salaried positions object to such action, and a decisive tussle between the two factions is expected in the next assembly, with the chances in favor of the anti-racing element. \* \* \*

In all sections of the United States, except in the East, the League's control of the sport has been undermined. In the Pacific coast states the California Associated Cycling Clubs are supreme; in the middle west, with headquarters at Denver, Col., the Western Cycling Association is usurping the League; in the South the Southern Cycling Association, with headquarters at New Orleans, La., has assumed the direction of affairs, and in Wisconsin, Michigan and other states a similar condition prevails.

There will be held in New York city early in December a meeting of race-promoting clubs, track owners and professional riders, for the purpose of forming a new body in the East which will effect alliances with the governing associations in other parts of the country. When this is accomplished an application for membership in the I. C. A. will be forthcoming. As the championships for your association are scheduled for Montreal, Quebec, next year, we presume that our presence will be desirable, in order to assure a success. For this reason we would suggest that a final judgment on the present situation in America be deferred by your association until matters shall have reached a more definite conclusion. \* \* \*

The American Racing Cyclists' Union contains all the leading professionals of the country, and since its formation there has been only one prominent deserter. The riders are determined never to accept government again from the L. A. W., and at the same time they fully appreciate the necessity for a direction of the sport which will make it absolutely free from taint. For this reason the riders have banded together in their efforts to induce the race-promoting clubs and track owners—the ones who have everything at stake—to perfect a new organization in the East, the other sections of the country already being provided, for the

control of cycle racing, which with proper guidance can be made second to none.

We realize that it will take time to formulate another organization, and our action was timed so that it would come at the termination of the outdoor season. Before the '99 campaign opens we expect to be riding under the rules of a body in which we will have a vote. In our opinion the time had come when it was better for the professional cyclist to be disassociated with the L. A. W., and incidentally we might express the opinion that the League, unhampered by racing, could devote itself to the objects for which it was formed, and enter upon a new era of prosperity and increase.

\* \* \*  
E. C. BALD,  
President American Racing Cyclists' Union.

### Miller Makes Prophecies.

C. W. Miller, of Chicago, is home again, after his three months' trip abroad. His only victory across the water was the winning of the 72-hour race in Paris, but he believes he would have had a good chance at first money in the Berlin 24-hour race if it had not been for the breaking of his wind shields and ten of the chains on his three petroleum motor tandems during the first nine hours, and a bad fall in the tenth hour. Huret won the race, and now Miller wants to meet him in a match race in Paris next year. Frederic, the Swiss rider, who ran second to him in the 72-hour race, and rode continuously for 42 hours without a dismount, he looks upon as a dangerous competitor, and prophesies that he will finish among the first three in the coming New York six-day race. If Miller wins this race he says he will go for the 24-hour record in Paris, and feels confident that, paced by motor tandems fitted with wind shields, he can cover 700 miles.

### CONCENTRATED POT-POURRI.

Chairman Mott announces that the following foreign racing bodies will recognize the suspensions by the L. A. W. of the members of the A. R. C. U., who have competed in unsanctioned meets: Canadian Wheelmen's Association, Canada; National Cyclists' Union, of England; Irish Cyclists' Association, Ireland; Scottish Cyclists' Union, Scotland; Union Velocipedique de France, open, and Union des Societes Francaises des Sports Athletiques, amateur, of France; Deutscher Rodfahrer Bund, Germany; Allgemeine Niederlausche Nieldrieder Shond, Holland; Ligue Velocipedique Belge, Belgium; Union Velocipedistica Italiana, Italy; Cape Colony Amateur Athletic and Cycling Union, Cape Colony, and Union Ciclistas Mexicana, Mexico.

Henri Fournier, the French cyclist now in New York, was riding his motor bicycle on Fifth avenue the other day when a policeman tried to stop him. Fournier supposed the policeman wanted a race, and putting on about twenty-five miles speed, left the policeman behind at once. The latter kept him in sight to his hotel and then arrested him. The police locked up the automobile and let Fournier go on his own recognizance.

John S. Johnson is being brought forward as the original inventor of the detachable tire. In 1890, when he was working in a Grand Rapids repair shop, he made a detachable tire and fastened the outer cover to the rim by means of little hooks placed about an inch apart. It did not occur to him to patent the device.

Fred Schade, intercollegiate champion of '96, who was this summer thrown into the professional class because he declined to answer Chairman Mott's list of questions, is now an editorial writer on one of the Boston newspapers.

A circuit had been arranged in California for this fall, including eight nights and two afternoons of racing indoors at San Francisco, and meets at San Jose, Santa Rosa, Los Angeles and elsewhere.

An English exchange expresses wonder that Michael does not go to Australia for a racing tour, pointing out that he would undoubtedly be a great attraction there.

Tom Cooper expects to keep in training this fall and ride in the Madison Square Garden and other indoor races the coming winter.

The present membership of the L. A. W. is 80,516 as compared with 99,615 a year ago.

Walter Wilson, of Buffalo, acting as temporary racing chairman for the A. R. C.

# Columbia

## Bicycles

PRICES ON AND AFTER NOV. 1ST, 1898.

Columbia <sup>Bevel Gear</sup> Chainless, - \$75.00 Models 50 and 51.	Columbia Tandems, - - \$75.00 Models 47 and 48, Diamond and Combination Frame.
Columbia Chain Wheels, - 50.00 Models 57 and 58.	Hartford Bicycles, - - - 35.00 Patterns 19 and 20.
Columbia Chain Wheels, - 40.00 Model 49, 1899 Improvements.	Vedette Bicycle, { Pattern 21, for Men, 25.00 Pattern 22, for Women, 26.00

We will be in a position to supply 30-inch Bicycles at \$60, built on the same general lines as the model 57, to meet a limited demand for tall men. We also have a few Columbias, Model 46, and Hartfords, Patterns 7 and 8, on which we will quote prices on application.

There is going to be a great big demand for the Columbia Chainless at \$75.00. We are preparing to meet this demand and we have facilities for making many thousand Chainless wheels. The prudent dealer, however, will not delay in sending in his orders early. Besides you should be able to do a good business this fall and winter. The Columbia Chainless, you know, is not affected by the weather and can be ridden the year round.

The Columbia chain wheels, Models 57 and 58, are up to date in every detail, and we believe are the handsomest and most stylish chain bicycles that have ever been put on the market.

Columbia Model 49, with 1899 improvements, is the greatest bargain at \$40.00 that we know of. There ought to be good business in them for you.

Hartfords at \$35.00 and Vedette bicycles at \$25.00 and \$26.00 give a complete and well rounded line for any dealer.

Call on or write now to the Columbia distributing point in your territory and secure the agency before your competitor gets it.

## AND TRADE REVIEW

VOL. XXII—No. 2.

CHICAGO, NOVEMBER 10, 1898.

NEW SERIES No. 51.

### LOCAL BOARD RECEIVES AID LAW SUIT BY SHOW MANAGERS

**Chicago Dealers Association Hard Pressed  
Gets Legal Assistance from  
National Board of Trade**

At the last meeting of directors of the National Board of Trade of Cycle Manufacturers money was voted to aid the Chicago local cycle board of trade in defending a lawsuit in which the local board finds itself involved in consequence of action taken by it to prevent a promoter's cycle show in Chicago from interfering with the legitimate course of trade. The Chicago legal representative of the National board was also placed at the disposal of the Chicago board as assistant counsel. The history of the case is substantially as follows:

In September, 1897, an announcement was made by an association terming itself "The National Cycle Racing Association" that from November 20 to November 27, 1897, the "Fourth Annual Cycle Show" would be held in Battery D, Chicago, and that the "1898 models of all prominent manufacturers would be exhibited," the announcement causing much surprise in trade circles. The Chicago local board investigated and found that the association termed "The National Cycle Racing Association" was composed of a lawyer named Tackberry, one J. D. Guinea, a newspaper reporter, and the manager of the show, Frank Hall.

#### Views of Chicago Dealers.

The Chicago local board did not find anything in the reputation of these men to warrant a belief that the proposed show would in any manner reflect credit on the cycle industry, but came to the conclusion that the situation which they had to face was about as follows: A set of men were about to foist on the Chicago public a "fake" show; these men termed it the "Fourth" annual show in order to mislead the public to class it with the Third Annual Show held the year previous in the Coliseum under auspices of the National Board of Trade; they boldly claimed to exhibit 1898 models of all leading makers, although such models were not and could not be ready for the dates set for the show; and they claimed that the leading makers had taken space and would exhibit, a statement which the local board found contrary to the facts as ascertained by the board's own investigation.

Under these circumstances, the local board first announced that it had refused sanction to the show; second, sent a paper to all manufacturers and dealers in Chicago to be signed, agreeing not to exhibit; third, passed a resolution setting forth what appeared to it the correct character of the show, which was sent to all the newspapers, asking that they properly represent the affair to the public, so the

cycle trade as a whole should not be injured in the eyes of the public.

The show was held and was made up principally of small repair men, only one dealer and manufacturer at that time prominent—the Warman-Schub company, now defunct—being represented. According to reports in daily newspapers, which were serviceable to the promoters, the affair was a "howling success," but Messrs. Guinea and Hall apparently saw further opportunity for gain ahead; for they entered suit against the Chicago local board of trade, collectively, and each of its directors individually, for \$100,000 for libel, claiming this damage under the conspiracy and boycott act of Illinois for the ruination of their venture.

#### The Aid Comes.

This suit is now being pushed through the courts as fast as possible, leaving the Chicago board of trade little time for preparing a defense, and the board has therefore recently applied to the National Board of Trade of Cycle Manufacturers for support and assistance in fighting the case. The local board feels that in having championed the cause of a large number of leading manufacturers, who are not in any way liable under the damage suit, it was only following out a policy advocated and advertised by the National board, and that it is therefore entitled to protection by the National board against dangers arising from such a course.

The appeal of the local board was not in vain. On Monday this week it received assurance from the National board that the cause would be considered one of vital interest to the trade at large and the Chicago attorney for the National organization was placed at the disposal of the local board as assistant counsel for the defense of the suit.

#### New Board of Trade Secretary.

New York City, Nov. 5.—At the last meeting of directors of the National Board of Trade of Cycle Manufacturers the resignation of Secretary W. Wardrop was accepted and George E. Hammanu, heretofore assistant secretary, was appointed to fill the vacancy.

### TACTICS OF SHOW PROMOTERS

#### BID HIGH FOR BOARD SANCTION

**Trade is Led to Suppose That Cost is  
Small and National Board Will-  
ing to Negotiate.**

A few leaves from the correspondence which has been exchanged on account of a proposition for holding cycle shows in New York and Chicago extended by B. E. Greene, special agent of Grand Central Palace building in New York, throw light on the position taken by the National Board of Trade of Cycle Manufacturers in regard to cycle shows in general and may also serve to place show propositions made by promoters in other localities under a new angle of vision to the trade in general.

#### Preparations Are Made Early.

On March 30, Mr. Greene first approached the National Board with a detailed proposition for the two projected exhibitions, offering the Board the entire gate receipts of both shows in return for its sanction of the enterprise. It was a business proposition worth listening to if it had been the Board's intention to replenish its coffers without regard for the trade interests of its individual members and manufacturers in general.

This letter was followed on August 6 by a letter addressed to the secretary of the Board. Copies of it were mailed to manufacturers. It runs as follows:

Confirming my recent conversation with you, there are several different propositions upon any of which I would be willing to conduct a cycle show with the cooperation or sanction of the Board of Trade.

You already have in front of you one providing that the entire gate receipts should go to the Board and that we should assume all the liabilities.

We would also be willing under the same general conditions to allow you 50 percent of the gross receipts.

Or we would allow you 60 percent of the net receipts, specifying in detail the sum to be expended for different purposes.

If it should be the policy of the Board to hold a show, making the expense to exhibitors as small as possible, this plan could be carried out by charging a nominal entrance fee of \$10 for each exhibitor, allowing the Board to allot the space, and we would rely on the gate receipts for rental and expense. On this plan the Board would receive no financial benefit.

We would also be willing to conduct a show on very much the same terms on which the last show at Madison Square Garden was conducted, and would be willing to give the Board of Trade a considerably larger percentage on the same sliding scale.

In fact, if the Board decides to take any part in the show, I do not think we will have any difficulty whatever in devising a plan which will be satisfactory to both of us, and on any proposition suggested above I am prepared to give ample bond for the carrying out of the contract.

In considering the question from the standpoint of the individual exhibitor, you will

of course remember that my first proposition provided that the cost of extra electric lighting would be made one-third less than at the last show in this building.

Subsequently, on November 1, Mr. Greene sent to the trade another letter in explanation of the one addressed to the Board. This letter reads:

We have mailed you a copy of a letter which was sent to the National Board of Trade of Cycle Manufacturers a few months ago. In explanation we desire to state that the tentative propositions contained therein were offered without any solicitation on the part of the Board or its officers. While we do not pretend to any specific knowledge of the bicycle business, our ideas on the trade shows in general are not based on theory, but on actual experience, and our object in laying this matter before you, as stockholders in the Board of Trade, was to show you that the large expense heretofore entailed in making an exhibit as a bicycle show was entirely unnecessary.

#### Board Disclaims Connivance.

This letter was barely in time to forestall the charge of misrepresenting the Board's position to shows in general, which might have been brought against Mr. Greene, for on the next day, November 2, the Board's secretary found occasion to set the trade right on the situation by the following letter mailed to Board members:

To members of this Board:—B. E. Greene, the agent of The Grand Central Palace in this city, has recently sent a copy of the enclosed letter, the text of which in many places makes it appear as if the Board was again negotiating with him for the conduct of a cycle show.

The proposal contained in Mr. Greene's letter is but an amplification of a similar proposal made to the Board on March 30. Neither of these proposals received consideration at the hands of the directors of the Board, who, in session on August 18, voted adversely upon the question of holding cycle shows.

The general issuance of Mr. Greene's letter bearing date of August 6 was unauthorized by this Board and was accomplished without the knowledge of any of its officers.

#### DEALERS' COSILY VENTURE

##### Broken Bones at Race Meet to be Paid for by Agents Who Conducted It.

Minneapolis, Nov. 7.—A verdict has been secured against Minneapolis bicycle dealers in the case brought by parties injured by the falling of the bridge at Lake Harriet during the road races, June 18. The verdict is for \$1,500, and was in the particular case of Merrick Shirley, by guardian, against the Moore Carving Machine company, Northwestern Cycle company, Tribune-Deere agency and Honstain & Weston. A stay has been taken, as there are several important exceptions on the records. There are seventeen more cases to come, and should they all result as this one has, it will prove that the races were a very expensive venture for the Minneapolis cycle dealers.

During the first part of the week the cases as applying against the city were argued, but were thrown out of court, it being held that the city could in no way be made a party to the action. The bridge which fell was a temporary affair built over the track, so that people could go to the pavilion from the street car without interfering with anything that might be going on. Over a hundred preferred to view the races from the bridge, and although the policemen spoke to them about getting down, they remained. The break came as the riders were about to finish in the first event. As the riders passed under the bridge, there was a general rush to the finish side. The strain was great, and down the structure came, precipitating the people to the ground a distance of fifteen feet. No one was killed, but there were a few cases of broken bones and bad bruises.

## INJURY DONE BY SHOW TALK

### ARGUMENTS OF A TRADE LEADER

#### Every Healthy Form of Trade Activity Is Delayed So Long as Shows Are In Prospect

New York City, Nov. 5.—Opposition to a national cycle show or even to a local show that may pose as one and entail expensive assistance from the wholesale trade is undoubted, emphatic and almost universal among leading makers with headquarters here or who have visited the city since the proposition was formally promulgated by Manager Sanger of the Madison Square Garden. As the representative tricycle manufacturer of the Metropolitan district and one of the leaders in the cycle trade of the country, R. H. Wolff, of R. H. Wolff & Co., Ltd., was interviewed to-day as to his opinion of the advisability of the trade supporting a show in this city in January, either national or local. It is well known that Mr. Wolff's arguments and influence at the meeting of the local board of trade last winter greatly availed in the abandonment of the local show then proposed.

#### Generic Advertising Superfluous.

"In general," said Mr. Wolff, "the bicycle has passed the period when it needs advertisement as a vehicle of convenience or pleasure. It is under present conditions a superfluous kind of advertising that the trade cannot afford. Manufacturers should avoid every move that tends toward extravagance; and the enormous cost of these shows to the exhibitors is well known. They must do business on a close basis if they would at present low prices give the public a good machine. For our part we have maintained one quality and we cannot do so and spend money in this foolish way. These shows are responsible for the mushroom manufacturers whom they give birth to and perpetuate. If makers foster and encourage them further they will have themselves to blame for the results. This show proposition should be sat upon at once and emphatically before it can work any injury to next year's trade."

"What do you mean by that?"

#### Mere Schemes of Promoters.

"I mean that a show and perhaps the mere serious proposition to hold one will upset the whole bicycle trade of the country. The makers have their plans under existing conditions and have sent out their salesmen. If the dealers believe a show will be held or even think that one may be possibly held they will refuse in many instances to make purchases or close agencies until the show is held or probability of holding one is settled. If manufacturers countenance such a show they will be responsible for upsetting the entire cycle trade for this season. The suggestion for a show is not the outcome of any desire to help the bicycle trade, but is a mere private money making scheme of private promoters."

"But suppose the January show at Madison Square Garden be only a local show?"

#### Theory Advanced by the Unsuccessful.

"If it pretends to be a local show then it can be of no avail in influencing retail trade if held in January; for by the time the buying season comes two or three months later the public will have forgotten all about the models they have seen and all the value of the advertisement will be lost. A local show in January will be of no profit to the dealer and he will have spent his good money without

benefiting any one but the promoter of the show."

"How has the loss of advertisement by the abandonment of shows affected sales since they were given up?"

"Not only have the exhibiting makers saved the thousands of dollars the shows cost them, but among the recognized makers of standard goods at least there has been no complaint of a falling off in sales. As for ourselves, we have gained in sales. It is the unsuccessful maker every time who is found advancing the theory that his falling off in business is due to the loss of show advertisement. Some cycle makers want to exhibit other goods than bicycles, for instance, motor carriages. Why should the bicycle makers of the country be asked to pay big money merely to make an exhibit of their rivals' motor vehicles a success? I tell you the trade should at once announce an emphatic refusal to lend itself to a mere private money making scheme before damage comes through upsetting trade. A cycle show is not only extravagant, unwarranted and unnecessary, but will prove a serious injury to the trade as well."

#### Spaulding Machine Screw Co.'s Affairs.

Carlton H. Ladd, who was appointed referee in the proceedings to wind up the affairs of Spaulding Machine Screw Company, has made a report to the Supreme Court. Mr. Ladd took a mass of testimony, and reports that there is due John R. Keim, of New York city, \$52,000 for money advanced to conduct the business and which is secured by a mortgage. The referee holds that the mortgage should be foreclosed. Counsel for Mr. Keim made a motion before Judge Laughlin in special term Saturday to confirm the report. He also asked for \$1,500 costs in the proceedings. The judge withheld his decision. In all probability the plant will be sold about the first of December. Loran L. Lewis, receiver of the business, hopes to sell the plant for a sum that will satisfy all the indebtedness against the company and still have money for the stockholders.

#### Poor Goods by Fall Shipments.

It is estimated that from 1,200 to 1,500 American bicycles were sold in Rotterdam, Netherlands, during the season of 1897, and it is expected that when the figures for the current year are completed they will show a heavy increase over the preceding year. Unfortunately, most of those imported last year were of the lower grades, and the impression got abroad that no first class machines were made in this country. Probably on this account the English bicycle had the preference when a first class machine was desired. However, it has lately become generally understood that a cheap American machine is better for the price than the average British machine. Rotterdam dealers complain that some American bicycles show that they are made in a hurry, and that better goods are sent out in the spring than in the fall.

#### Parts Makers Soon to Meet.

The leaders in the Stockton movement for organization of makers of hubs, pedals and other parts announce that a meeting of the manufacturers to adopt plans of organization and elect permanent officers will be held at Waldorf-Astoria hotel in New York city, Thursday, November 17, at 11 o'clock, a. m.

When a sale of goods is made for cash on delivery and the goods are delivered, but the price is not paid, the title remains in the seller.

## WANTS OF BRITISH RETAILER NET PRICE SYSTEM IN ENGLAND

**Changes in Bicycle Equipment That  
English Dealers Would Appreciate  
—Latitude in Price Needed**

Tardily following the example of the Rudge-Whitworth company, which declared a net selling price for its bicycles shortly after the \$75 price had been generally announced in United States by leading makers in the fall of 1897, and whose dividend and surplus for the current season seem to have convinced other English makers, the whole English industry is now alive with pronouncements of new net prices. The nominal reductions announced in the figures given are very radical, but the practical price-lowering is much smaller, as in most cases agents heretofore have taken it upon themselves to bring the figures to a competition level by shaving down their abnormally large trade discounts. The new move contemplates to tie the agents down to a fixed selling price and thereby enable the large manufacturers to quote prices in advertising which will not make the machines built by local assemblers appear as the cheapest in the market. A real reduction of prices, besides the nominal one, has been necessary to create the desired effect, but it seems that several makers have gone so far in this direction as to interfere seriously with the agent's profit and latitude in negotiating sales. It is this side of the matter which has called forth a letter from a prominent English dealer to Cycle Referee, which is of interest to American exporters as well as to English manufacturers, by stating the requirements of English agents in regard to construction and equipment of the cycles he shall sell. The letter is as follows:

### Competition With Local Makers.

"Time is money, but the agent has to have his time monopolized from day to day with clients who over-patronize him, not to say anything of little repairs, adjusting, inflating, oiling, etc, which is not expected to be charged for. If net prices are generally decided upon sufficient margin must be allowed for a substantial profit to cover all the agent has to contend with.

"It appears to me that manufacturers have taken up the net price question in order to compete against local makers, but for the agent who does not build net prices will be too final in treating with a customer, consequently the intending purchasers will not call again, and the small maker will be better able to treat with them. If a change is necessary better not list the price at all; that can safely be left to the agent in quoting.

### Points for American Exporters.

"There are a few suggestions I would like to throw in for next year's machines which are of significance, such as chain-wheels minus of the shroud, chains running more silent and easier without lateral support. Ladies' machines to be geared higher, spokes of all machines to be enameled or stained instead of plated, and straight-laced dress-guards. As it rests with the agent to suit his client with saddles, full allowance to be made by cycle firms less saddles when so ordered, foot-rests that can be fixed with the bolt and screw on the outside of the forks, and so avoid the accidents caused by the foot-rests becoming loose and slipping down into the spokes of the wheel, a little more handlebar and brake rod for adjustment, a more acceptable inflator than the one generally supplied

with tires, and tires that will not crack and break to pieces."

Commenting upon the net price problem, Cycle Referee suggests a modification in favor of small discounts. From opinions that have been expressed by agents throughout the country, says the Referee editor, it would seem that, if the reduction in both net and list price is to have the effect of increasing the enthusiasm of the agent for the factory-made machine, it will be advisable to still leave a margin between the price at which the machine is listed and the lowest figure at which the agent can sell, he still obtaining a living profit. By no other means can the agent make the adjustment which is necessary in dealing with people who require different lengths of credit. It is not intended that any return should be made to the 20 and 25 per cents, of the old days, but there is undoubtedly a strong feeling that from 5 to 10 per cent difference between net and list prices will be of benefit rather than otherwise.

## TRADE IN OLD MEXICO

**Flourishing Neighbor Republic Has No Bicycle Factories—Excellent Field if Properly Cultivated.**

Our bicycle trade with Mexico has trebled within the last year or two, and yet it is only in its infancy. The move for better streets and roads, a move that comes with the bicycle everywhere, has reached Mexico and is bound to benefit the bicycle trade. Monterey, one of the principal cities of the republic, since the laying of a few miles of modern brick pavement, has taken to the bicycle in a way that is bewildering. The same results can be counted on in every one of the chief cities. As there is now not a single bicycle factory in the republic, although a concession for one at the capital has been granted, it behooves our manufacturers in this line to press their goods with vigor.

Manufacturers should consider Mexico as they would a state of the Union, and should seek trade there as they would at home. They should remember that it is only a few hours' ride from us and has a population as large as that of Canada, New England, and all of the Rockymountain and Pacific states and territories combined. Trade must be talked for in Spanish. Nothing works so well in Mexico as a local agency. Competent Spanish-speaking agents are next in efficiency. Every point of importance has an American consulate and more or less Spanish-speaking Americans, who are available as trade seekers. Every route by rail into Mexico has its customs agent, whose business is to give information as to duties and to facilitate the passing of goods through the Mexican custom house. They are men of exceptional intelligence and experience, whom it is well for American manufacturers to consult. Long credits are the rule in Mexico, and with well established houses are entirely safe. A mercantile agency under American auspices is in thorough working order in Nuevo Laredo and performing those functions so necessary to the safeguarding of trade.

### Sundries Makers Robbed.

Minneapolis, Nov. 7.—Thiem & Co., St. Paul, manufacturers of the Thiem toe-clips, have for some time past been systematically robbed, the thieves paying particular attention to the small tools in their die making department. Last week they carried off a complete set of twist drills and fluted spiral reamers to match drills. Two employes were arrested and a large amount of stolen property recovered.

## DOUBLE LICENSE FOR AGENTS

### EXCHANGE OF MACHINES TAXED

**Washington Dealers Compelled to Pay  
Junk Shop License Tax or Quit  
Trading-In Practise.**

Washington, Nov. 7.—The cases of the several bicycle dealers who were recently arrested for alleged violations of the law requiring second-hand dealers to pay an annual license tax of \$40, were called in the police court last Friday. The prosecuting attorney and the attorneys for the defense agreed that one defendant should be selected for trial, and in this case, should the court decide that the law was applicable to bicycle dealers, the question involved could be taken to the court of appeals and finally settled. J. D. Lasley, who was one of the first dealers arrested, and who is one of the most prominent dealers in this city, was selected to stand trial. Counsel for the defense then made a motion to quash, alleging legal reasons why the paper filed should be set aside. The form of the information was even attacked, but all these attempts to end the case were overruled by the court.

### Regular Second Hand Business.

The prosecuting attorney argued that the handling of second-hand bicycles by dealers brought them within the provisions of the law. He pointed to the fact that dealers accept these bicycles in part payment for new machines, and that after repairing these old bicycles the dealers then put them on sale. The defense admitted these facts. Counsel then cited various authorities in support of their position and the case was then given to the jury, who brought in a verdict of guilty. Mr. Lasley was placed under \$200 personal bonds.

The prosecuting attorney stated that should the court of appeals uphold the decision, it will mean an annual increase of about \$100,000 in the revenues of the district. A decision against the dealers, he said, will mean that all business men who take second-hand goods in part payment for new, and then dispose of the old goods, will be liable to a license tax of \$40. Dealers in bicycles, typewriters and harness will be among those who will be most affected. The decision of the court of appeals will be awaited with interest.

## WOOD RIM JOINT PATENTS

**Milwaukee Judge Renders Sweeping Decision  
Affecting Rim Makers.**

A decision was rendered last Monday in the United States circuit court in Milwaukee which may prove of interest to wood rim makers. The suit was brought by Indiana Novelty Mfg. Co. of Plymouth, Ind., against Crocker Chair company of Sheboygan, Wis., and the Smith-Flanders company of Milwaukee to enjoin these firms from making wood rims with the Plymouth joint. The court found objection to the validity of the Indiana company's patent in the fact that wood rims were used long before the date when the company's patents were obtained and declined to sustain the injunction.

From reports so far obtained it seems uncertain whether the decision has reference to the manufacture of wood rims in general or only to the employment of certain means for joining the meeting ends of the hoop.

The size of a bill is never reduced by filing.

### DEALERS' PROPER FIELD

The sideline idea, as first advocated and elaborated in this paper, is being strangely distorted by correspondents and editors who at a late hour have perceived the necessity of paying attention to this phase of cycle retail business. Found napping when there was first need of missionary work for the idea in its general features, they now fail to perceive its natural limitations and run afoul of another trade phenomenon—the department store—which has nothing to do with cycle trade as such. They are to all intents and purposes championing the promiscuous adoption of all other lines of goods by cycle dealers and advocating that every cycle dealer should strive to sail as close to the department store plan as his purse and opportunities will permit. Their advice may do no great harm, for cycle dealers are far ahead of these advisers in understanding of the situation. They will in many instances take up a line of goods which seems to be neglected in their community, and will make money out of it even though it has nothing in common with cycle trade, but they know full-well that they are not taking the first or the second or any step toward conducting a general store by so doing, but are simply availing themselves of the privilege to turn an honest dollar, which is open for any business man whose perceptions of trade chances are not dimmed by the routine of his own particular business. If they find that their facilities for selling cigars or stoves or millinery are really of permanent value they will naturally be as willing to make profits out of those lines as from bicycles, and a few may discover in themselves a formerly unsuspected genius for trade in such other lines which will insure them greater success than they could hope to attain in the bicycle trade. Nothing would be more natural under such circumstances than to abandon the bicycle business for the better paying line or to continue combining them if possible. But these are rare instances which should not be magnified into an example for the whole retail trade to follow.

It is ridiculous to suppose that any considerable number of bicycle dealers should find it practicable to establish new general stores in their respective communities and make them profitable, or that very many of them should have special ability for any one of the lines of goods which are regularly handled in those established channels of retail trade in which competition is strong enough beforehand.

As a remedy for the short season and limited sales in the cycle trade generally expansion on a promiscuous basis promises no better results than generally attends the opening of a new place of business, and those who recommend it might as well recommend anybody who has money enough to open a store to go straightway and do so. The great difference between adding bicycles in a small way to the stock of an establishment which has already hundreds of customers for other goods and, on the other hand, adding other goods to the stock of a bicycle establishment, needs to be recognized. Unless it is possible to point out a certain class of goods which the public would readily accustom itself to find in a bicycle store and which cannot be regularly found in any other kind of store under local conditions, all rational foundation for expansion of the bicycle trade falls away and nothing remains of the sideline idea except a vacuous

and idle exhortation to display enterprise. And enterprise under untoward conditions is a much overrated quality.

The attempt has been made in previous issues of Cycle Age to show that there is a large range of articles, however, which are nowhere handled together except in some modern, progressive bicycle stores, and each of which has a too-limited sale to be the main article in a special store, except in very large cities. To articles of this kind the sideline idea must be restricted if it shall be consistent with the requirements of the whole retail bicycle trade. On this idea every bicycle store in the country may expand its scope and take in as varied an assortment of articles as are found in a drug store, a hardware store or a stationery, and yet the general character of all bicycle stores would be recognized as the same all over, varying only in completeness according to the size and conditions of the town of location. The bicycle store under such a development would be a sort of commercial missionary station in its locality, where the inhabitants might be reasonably sure of finding all those numerous things—largely the products of modern invention—of which they could not be certain of finding any in any other one class of the commercial establishments to which the particular locality would afford permanent support.

It should even at this early stage be possible to furnish lists of articles approximately representing the possible scope of bicycle sidelines graded from a long list for towns of five to ten thousand inhabitants to shorter lists for larger cities and also shorter lists for the minor towns and villages. To compile such lists and offer the goods embraced in them to the retail trade in a practical commercial manner, remains one of the business opportunities which enterprising sundry jobbers have before them.

### CHANCES OF THE CHAINLESS

With a winter before them and prospects none too promising for turning the days to account by assembling bicycles in competition with larger establishments, repairmen may have time to familiarize themselves with bevel-gear and other chainless bicycles, and those who avail themselves of the opportunity for doing so are likely to have a considerable advantage over competitors when next riding season shall have rolled around to its zenith. It has for some time been fairly well understood that the probationary period for bevel-gear bicycles has been passed and that manufacturers no longer harbor any serious misgivings in regard to them. A year ago conditions were different. There were considerable stocks of finished and unfinished chain-and-sprocket bicycles on hand, making it undesirable to market a large product of chainless machines at any ordinary price.

It was not quite certain what part repairs, under—or over—the guarantee, would play in the chainless trade. The possibility of radical improvements was not precluded. In brief, there were so many risks to be taken by forcing the sales of the new type of machines that all manufacturers who took it up at all, as of one mind readily fell in with the ultra-conservative price and policy that marked its introduction. All these things have changed, however. First of all the market was forced down by the appearance of cheaper models of the same general type. This alone has had a strong influence, but of still greater importance for prognosticating the probable position of chainless machines in the '99 retail market is the general cleaning up of old stock which has been characteristic for this business season, and which has cleared the atmosphere for any amount of vigorous campaigning for chainless machines that the manufacturer's of the same may see fit to indulge in. Their convictions in regard to mechanical fitness, elegance and saleability are no longer handicapped by tender regards for money invested in other directions, routine of their shops and similar considerations. They are practically foot-loose, and the first admonition of what may be coming has already been given in the form of a radical price reduction.

As if made to order to assist the makers of chainless machines, a good sized fad for 30-inch wheels has at the same time put in its appearance, removing to some extent the objection which might be raised against the bevel-gear type on the score of its weight, by increasing the weight of that class of chain-bicy-

cles which, by novelty and courtesy if by nothing else, might be classed as a competing article. When to all this comes that the public during the present season has gone through the slow process of learning to "embrace the monster"—no reflection on chainless machines implied—and has abandoned its borrowed pseudo-scientific objections to "transmission around corners," "side-thrusts," &c., &c., which were so faithfully absorbed by it last fall, winter and spring, it becomes a matter for careful consideration by dealers and repairmen as well as manufacturers to form an advance estimate of the proportion of chainless machines which is likely to be sold next year.

This proportion will not be alarmingly great. The price after all precludes that. But it will probably be sufficiently great to spell a good margin of profit or loss accordingly as the estimate is more or less close to the actual trade results. It seems also to be worth considering that possibly there may prove to be a close interdependence between sales of chainless bicycles on one side and 30-inch wheel bicycles on the other. There would seem to be a certain probability that the two styles will not thrive together in the same locality. Where the chainless gains the ascendancy among those looking for "up-to-date" mounts, the large wheeled machine will probably be frowned upon, and vice-versa. For the public rarely favors two fashions at the same time in an article like bicycles.

\* \* \* \* \*

That the value of a pneumatic tire depends very largely on the facility, or otherwise, with which it may be mended when punctured or cut, is usually taken as one of the recognized truths in bicycle lore nowadays. Mending of large rents will perhaps always remain a precarious job, so far as the rider is concerned, but it is being more and more vehemently insisted upon that ordinary punctures shall not cause permanent trouble. In this respect the usual single tube road tire with canvas fabric has suffered in public estimation. Fabric leaks and the unreliability of plug repairs have been the two drawbacks to this class of tires, even more than excessive adulteration of the rubber which enters into their composition. The latter is simply a question of price for which the remedy lies in the public's own hands. They can get good single tube tires with canvas fabric as well as with thread fabric, if they will pay for them. Some tire manufacturer might make the experiment of publishing the exact proportion of ingredients that go into his tires at the various prices, and await results. If he takes the trouble of safeguarding his statements so as to carry conviction to the most incredulous, it seems likely enough that he would enjoy a gratifying trade in his best article, for the public's inclination for the cheapest grades has undoubtedly been due very largely to the apprehension that a better price would not always be sure to secure them a better article.

\* \* \* \* \*

In regard to construction and repairs of single tube tires with canvas fabric there are two points, however, on which it seems as if something might be done to improve the situation. The suggestions are those of a layman on tire science, but no convincing objections have so far been offered against them by men in the tire industry to whom they have been mentioned. To prevent tire fabric leaks of the sinuous and insidious kind which makes the locating of a puncture as hard a task as its mending, it is thought that it might be useful to dip or soak the fabric in a very weak solution of rubber before it is wound on the mandrel or otherwise placed in position between the other layers. In thread fabric tires fabric leaks are partly obviated by imbedding the threads in rubber; still leakage occasionally takes place through the threads. Even this class of tires might therefore perhaps be improved by the proposed process. With fabric leaks eliminated the value of single tube tires would undoubtedly be enhanced. When a reliable and facile repair method were added the eventual results in regard to trade would be incalculable. Plug repairs have not been a decided success, and the question arises if the use of plugs is not wrong in principle as well as in application.

\* \* \* \* \*

The popular tendency, when the "repair strip" is not available, is in favor of plugs with very large, patchlike, disks or heads, but in reality the plug stem is a hindrance for the inser-

tion of such large plugs through a small puncture. The stem is too bulky and, moreover, its attachment to the flat circular portion makes it necessary to mold the latter with greater thickness than would be necessary for a patch, lest the violence of insertion shall tear a hole where stem and disk are joined. Much might be gained if makers of single tube tires would resolutely devise suitable means for the insertion of thin patches through a puncture. A very simple instrument would suffice, it seems. It might comprise a thin hollow rod, with butted end, around which the patch would be wrapped with its center against the butted end; and an outer split metal protector which might be gathered around the patch by means of a friction ring, as in a slate-pencil holder, coming together at a point below the patch and guiding rod. In this position the instrument should be forced through the puncture, lubricated with water or saliva if necessary, and the protector should be withdrawn while the hollow rod pressed the patch against the rim side of the tire. Being perfectly dry the patch would spread out by its own elasticity. Then cement could be poured or pressed into the hollow rod from the outside of the tire and caused to flow out of holes near its butted end. A little manipulation of the tire would serve to spread the cement over the patch without any danger of gumming more than one side of it, and when the desired degree of "tackiness" were obtained, the punctured portion of the tire could be permanently joined to the generous-sized patch while the rod were withdrawn.

\* \* \* \* \*

Probably the method might be further simplified. The main thing seems to be that manufacturers of single tube tires should cut loose from their exclusive allegiance to the plug repair, and try methods by which the vicinity of the puncture may be covered for a greater area than usually spanned by a plug disk, so as to guard against the uncertainty which arises from "cementing in the dark."

\* \* \* \* \*

The latest cry among bicycle constructors is directed against front forks of oval section. They are too stiff, it is said, and throw too much strain and vibration on to the stem and frame. Much more trouble has been experienced with the modern shapes of forks than with the forks of round section which were used by some manufacturers several years ago, but which are now employed, so far as known, by only one American manufacturer. In England the round forks used on the new Triumph spring frame models have raised the same question and Mr. Lovelace, an English manufacturer, who has specified round forks for all his machines for fourteen years, states that the advantages of the springy front fork are beyond questioning and experiment. The truly scientific front fork, it is claimed, should be made of tubing not only tapering in diameter but also in gauge, running from  $\frac{7}{8}$  inch by 16 gauge at the junction with the crown to  $\frac{1}{2}$  inch by 20 gauge at the axle end.

\* \* \* \* \*

An amendment to the spring fork idea is offered by a manufacturer who claims that the crown is too stiff and heavy. By making the crown lighter and sufficiently soft to bend under excessive stresses he proposes to obviate all chances of having the forks strained or the fork-stem broken. Whether this method also produces the easy riding which is claimed as one of the advantages of the round-section forks, is not stated.

\* \* \* \* \*

The argument on the whole seems likely to be taken up by makers of wood forks who might easily prove that suitably tapered one piece hickory or ash forks would respond perfectly to the requirements of springiness at a cost much below that of taper-gauged tapered tubing. Manufacturers of open-seam steel fishing rods may also be able to offer a solution of the problem.

## FATE OF NATIONAL BOARD

### Disruption of the Board Threatened By a Faction—Stockholders Will Decide Its Future

New York City, November 8.—Mixed emotions agitate the members of the National Cycle Board of Trade as they endeavor to pierce the mystery contained in the following surprising announcement:

To Board Members.—You are hereby given notice that a special meeting of the stockholders of the National Board of Trade of Cycle Manufacturers will be held at the offices of the corporation, No. 320 Broadway, in the City of New York, on Thursday, Nov. 17, 1898, at 10 o'clock in the forenoon, for the purpose of considering the future work of the board.

This call is issued under authority of a resolution passed at a meeting of the directors of this board, held on Nov. 3, 1898.

Yours truly,  
Walter Wardrop,  
Secretary.

New York City, Nov. 4.

The interpretation of the foregoing official communication is that the stockholders of the Board, who are its members, will be asked on the day of the meeting to provide for the support of the organization without resorting to the discreditable practice of holding cycle shows. At this moment the Board is in receipt of no greater income than is derived from the dues of its 300 members—about \$1,500 a year. The present administration, not deeming it courteous or fair that the next board of directors should face the work of another year with insufficient funds, is in doubt about the proper course to pursue.

#### Income Is Insufficient.

At the meeting of the directors held on November 3 it was the prevailing opinion that the dues should be raised from \$5 per annum to something like \$50. If this is not done it will be necessary to so reduce the operating expenses of the Board that the sum of money now in the treasury will last for a longer time than it would under conditions which tolerated heavy expenditures without any sign of a supporting income. There is in the treasury of the Board at the present moment about \$10,000 in cash. The annual expenditures under the existing form of government are in the neighborhood of \$11,000. It is, therefore, quite plain that if additional income is not obtained the Board cannot carry on its business unless severe retrenchment is practiced.

At the special meeting of the stockholders it is probable that efforts will be made to disrupt the organization, the value of which is again gravely doubted by the controlling spirits in the organization. This intention, however, in no way foreshadows the action of the stockholders, who have never been taken into the confidence of the directors, either under the present administration or in previous reigns. To offset the determination of the powerful people who, it is alleged, are ready to undertake the strangling of the Board, there is the declared intention of a minority of the directors and a strong following of stockholders to continue the organization, though, as it may well be supposed, not under the present form of dynastic rule.

#### Radical Changes In Organization.

If two-thirds of the stockholders—that is, two-thirds of the stock issued—shall say that the Board work is worthy of continuation, some radical changes will in all likelihood follow this decision, chief

among which will be that all members shall exercise equal voting power. To this end it may be necessary to return the charter under which the Board now transacts business and make the organization voluntary.

The future of the Board lies with the stockholders. In this respect the situation is considerably different from what it was last January when, after much fervid talk of dissolution, the effort to disband was, through the activity of the loyalists, completely frustrated.

Between the present unsound method of financing the organization and the renewed talk of dissolving the corporation there is intimate connection. Between the ardent hope of the reconstructionists and the disappointment arising out of the past year's work there is an equally intimate relation. Thus the forces are divided—one party believing that the Board has a thorough right to enjoy perpetuation, though perhaps not in its present form on account of the opportunities which it has taken advantage of as well as the opportunities which have been neglected; and the other party contending that by virtue of the inability of the Board to rise superior to all obstacles placed in its way, it should be disbanded.

#### Existing Conditions Untenable.

Whatever the outcome of the controversy which is imminent, it is not to be denied that for the good which in the past the Board has accomplished, though the nature of its good works is habitually viewed through a telescope, it is worthy of perpetuation in some form or other. The confession of inability to make progress under existing conditions is by no means an irrefutable argument for the dissolution of the Board.

The present roster of the Board membership is as follows:

Arnstein, Eugene, 88 West Lake St., Chicago, Ill.  
Abbott, W. L., Duquesne Mfg. Co., Pittsburgh, Pa.  
Andrae, H. P., Jullus Andrae & Sons Co., Milwaukee, Wis.

 Wilmot, Frank A., The Wilmot & Hobbs Mfg. Co., Bridgeport, Conn.  
 Yost, Jos. L., Toledo, Ohio.

United States whatever his decision might be, and a final determination at an early date is the most important object sought by the litigants. A part of his opinion as he chooses to deliver it, is as follows:

"I start with the proposition that as between individual citizens originally there is the right as to who should bear the burden of service rendered. That a common carrier is subject to regulations by congress as to limitations upon its powers to make agreement with the individual citizens is not disputed. The proposition is, Has congress prohibited in this particular case the carrier from requiring the shipper to pay the increased expense of performing the act of transportation? There is no express language in the act that I can find laying the burden of that prohibition upon the carrier, and inasmuch as restrictions of the right to contract, which is a right of a great deal of value to the citizen, should not be spelled out of any uncertain language. I am induced to reach the conclusion, without the careful examination and analysis of the cases which might lead me to a different conclusion. I am constrained, I say, to reach the conclusion that the act has not prohibited the carrier from requiring the party tendering the goods to pay to the carrier the increased cost which the act of congress has made.

"It seems to be of the utmost importance, not only to the express company, but to the individual shipper, to have this matter authoritatively settled. It is extremely necessary that there should be an early decision in the court of last resort. A decision here is worth nothing; it will not settle the question."

**BROOKLYN BOARD ON SHOWS**

**Announces That it Will Neither Support Nor Oppose a Bicycle Exhibition Given by Cycling Clubs.**

The Brooklyn Cycle Board of Trade has passed the following resolutions in order to declare its attitude toward shows:

Resolved, That this board repudiates in their entirety the statements recently made in a Brooklyn paper purporting to show animated opposition on the part of the board to the cycle show to be given by the Associated Cycling Clubs of Long Island, and characterizes such statements as being without foundation and untrue in every particular. That this board, while still of the opinion that a cycle show is neither necessary nor advisable, so far as the welfare of its members is concerned, will not object to nor oppose in any manner an exhibition held by any other responsible body or association.

President George W. Bennett of the board has also issued an open letter stating that while the board as a body will not support shows, it will not oppose the one being promoted by the Associated Cycling Clubs of Long Island.

**Small Boys Steal Accessories.**

Toledo, Nov. 7.—The theft of license tags, bells and repair kits from bicycles have recently become so frequent that the police made it their business to look for the perpetrators of the troublesome crimes. Late last week two ten-year-old boys, sons of prominent parents, were arrested. The boys were given a hearing and were sent to the industrial school.

**Error in An Advertisement.**

In the one-page advertisement of Pope Mfg. Co., which appeared in this paper in the October 27 issue, the price of Vedette, pattern No. 22, for women was given at \$25, or the same as the Vedette pattern for men. The price should have been \$26, or one dollar more than the diamond frame pattern.

**DECISION ON WAR TAX**

**Circuit Court Judge Holds that Express Companies May Put Revenue Burden on Shippers.**

New York, Nov. 7.—In a test suit brought by Merchants' Association of New York in the name of William Crawford, against Adams Express Company, United States Circuit Judge Lacombe has handed down an opinion, according to which express companies have the right to compel shippers of goods to pay the 1-cent war stamp tax upon bills of lading, imposed by the act of congress, which became operative on July 1, 1898. The case has attracted widespread attention among New York business men, and, being a test suit selected from a large number of similar suits pending, involves thousands of dollars besides the general question of the right of public carrier companies to shift tax burdens imposed upon them onto their customers. Numerous suits brought in United States courts throughout the country have been held in abeyance pending Judge Lacombe's decision. The judge, however, finds it needless to examine the case thoroughly, as, he says, it is undoubtedly destined to be carried to the Supreme Court of the

## REPAIR SHOP ECONOMICS

### Broken Pedals Are Usually Replaced But Sometimes It Pays to Mend Them—Various Methods

If there is any branch of cycle repairing concerning which the average repair man has but very vague ideas it is work on pedals. But little attempt has ever been made to do actual repair work on pedals, the extent of the operations commonly performed being to replace broken parts by substituting new ones obtained from the makers. However, this method of substitution has always proved unsatisfactory and many are the repair men who have cursed pedals and pedal injuries in general. Pedals are constantly breaking in some way or another, and while it seems simple to replace, the work of doing so is greatly hindered by the inability to get parts with which to replace the broken ones. There was never a time when pedal breakages were not common and the recent introduction of the low hung frame coupled with the reckless riding of the same over rough and stony roads has made such breakages now more frequent than in the past.

#### Riders Like to Save Whole Parts.

That there should be some way for the repairer to get around pedal injuries in a more facile and remunerative manner than by replacement is apparent. Just what this way is, is not so plain. But

there are several courses which may be adopted at times according to the judgment of the repairer, and which may be adopted with more profit than the common practice of selling new pedals to take the place of old ones which are injured in some respect that does not make the pedal as a whole worthless. The practice of putting on new pedals is sometimes the best, but there are times when it is possible to repair or to replace only certain parts, the latter course should be taken. The selling of new pedals may save money for the rider as it gives him a permanent and first-class repair, and it may often save money for the repairer as it gives him a sure, though perhaps a small profit. But in pedals, as in everything else, the average rider dislikes to throw away whole parts merely to get some small item fixed. The supplying of whole new pedals suits some customers, but the repairer might as well get also the trade of those who do not want to abandon their old parts, even though he have to do a little thinking in order to accomplish a repair in an instance where with another patron he would replace the entire pedal. The main difficulty in the way of putting new parts in pedals arises from the fact that there are many different kinds of pedals which are very similar in design and that it is extremely difficult to get parts even though the customer is satisfied to wait three or four days for the repair, because only one or two brands of pedals have the maker's name stamped on them and the repairer has hard work re-

cognizing the pedal. By supplying a whole new pedal he does not have to exactly duplicate the old one, but can supply from common standard patterns carried in stock.

#### Three Courses Open.

There being three courses open to the repair man it becomes the best policy not to adopt any one of them, but rather to adopt all and in each instance of pedal repairing to judge which one is best suited according to the circumstances governing the job. He may replace entirely, he may replace certain parts by ordering from the factory or supply house, or he may repair the broken parts. Some pedal repairs which may be successfully put into operation are given below. If the repairer can use any of them in the place of his common method of sending for new parts, it will pay him to do so, as he thereby gains the good will of his patron and saves himself the risk of misfits, a very common occurrence in ordering new parts for old pedals. Where the repairs suggested are not available, and where new parts cannot be immediately or satisfactorily obtained, the remaining option of putting on complete new pedals is still open.

#### Difficulties in Making Pedal Pins.

The known facts concerning the home making of pedal cups, cones and spindles are about the same as those relating to cups, cones and axles for hubs and hangers. If the repairer has a lathe and is expert enough to turn out cups and cones he may make such parts for pedals as well as for anything else. He is presented with one new difficulty, however. The pedal spindle cannot be made with the ease with which a hub or hanger axle may be turned up. In the latter there are no bearing surfaces made integral with the spindle. On the pedal pin there are two ball races. In order to harden the ball races the entire pin must be hardened, leaving it without the toughness properly needed to withstand the strains to which it is subjected. Accordingly the working of tool steel into pedal spindles which may be tempered in order to harden the ball races is not satisfactory with regard to strength. The repairer may make a tool steel spindle, but he has no assurance as to the length of time which will elapse before it breaks. He must case harden mild steel in order to get the proper spindle. Unless the repair shop be prepared to meet this need for case hardening or unless the proprietor is satisfied to put on a thin shell by case hardening with potassium cyanide leaving the spindle in first class shape for limited wear, new spindles had better be obtained from the maker.

#### Treatment of Loose Pins and Plates.

A frequent injury to pedals is the wearing out of the threads on the end of the spindle that screws into the outer crank end. This wearing out is usually accompanied by a similar wearing of the threads in the crank, thus making both spindle and crank practically worthless. As each part is beyond permanent repair a makeshift job may be executed, which while it spoils the nickel on the crank, enables the rider to go his way rejoicing with a tight pedal. The pedal parts should be removed from the pin and the latter wired in its proper place in the crank end. It is then brazed tight and the superfluous spelter filed off. The pedal is then replaced on the pin. After such a job has

been accomplished it is rather difficult work taking the pedal apart, as either the whole bicycle has to be tipped over on its side, or the crank has to be removed from the shaft. The repair cannot, of course, be executed on machines having the one-piece crank system in which the larger cones and cups have to be slipped off over the cranks.

On many of the cheaper varieties of pedals the riveting which secures the side plates to the pedal frame arms is very light and occasionally gives way. The repairer can re-rivet nearly as securely as before by simply driving the plate down to place, and with a center punch or a small cold chisel, upsetting the end of the arm. This is a bad repair to make, however, as the riveting put in by the shop man is very liable to give way within a short time. There are other kinds of riveting which may be satisfactorily done by the repairer, that shown

in Fig. 1, being an example. The frame arm in this instance comprises a flat plate and the riveting is originally accomplished by automatically pounding down two or three crosswise depressions, A, in the projecting end of the arm, thus upsetting the arm at these points. When such riveting gives way it may be riveted again by pounding down the end of the arms at those points between the original riveting depressions, leaving the rivet as strong as formerly. In the case of a common round rivet in Fig. 2, the best plan is to file down the plate seat on the arm before re-riveting, thus allowing for extra projection and an entirely new rivet head. The cold chisel or center punch method of riveting is too light to afford permanent repair. Some of the later pedals of high grade make have arms which are hollow at their outer ends and spun over at the edges, thus riveting the side plates in place, the construction being illustrated in Fig. 3. If such riveting comes loose or if the side plate is to be replaced, the remains of the original spun-over edge should be removed with a file and the seat filed down for the distance necessary to afford new riveting stock. In order to properly spin over the new edge a tool must be made which requires a lathe for its application. The tool is shaped like that illustrated in Fig. 4. It is a head stock center, turned with a head shaped as shown, and filed off on two parallel sides. A plain center is placed in the tail stock of the lathe and the special center inserted in the head

stock. The pedal with the plate driven to position against the seat on the arm is placed against the tail stock center with the center entering the open end of the pedal frame arm opposite to that which is to be riveted. The tail stock is then screwed up, forcing the riveting center into the hollow end of the arm and spinning its edge over, the lathe, of course, running at the time.

#### Renewing Worn Teeth.

The difficulty in the way of refiling teeth in rat-trap pedals on which the original teeth have worn down till they fail to hold is that the filing will reduce the width of the plate to such an extent that the rider's foot will touch the pedal barrel. To get over this obstacle the old teeth may be filed off entirely, leaving the edge of the plate smooth, as shown by

Mention The Cycle Age

the dotted lines, R, A, in Fig. 5. A piece of flat metal is then cut out to proper shape and teeth filed in its edge, when it is then riveted to the plate as indicated by the piece, B, in the same illustration. C indicates the rivets, which must be placed near the center of the plate in order to avoid the rivet heads which hold the original plates to the pedal arms. Depressions or holes must be made in the new plates to accommodate these latter heads and allow the second plate to fit snugly against the inner one.

Entire new side plates may be cut out of sheet steel and placed on pedal frames as a substitution for the old ones, but unless the owner of the pedal is satisfied to have them go without nickel plating, the work had better not be done. If the repairer has to go to the trouble of having the home made plates nicked he had better order new plates from the maker. But

should the rider be in a hurry and want a fairly cheap repair, not caring for nickel, there need be no trouble in fitting the plates. The only difficulty will be that after the blanks are cut out and bent into the standard U shape the outer end will be straight, as shown at A, in Fig. 6, while in the original pedal the end is likely to have been slightly concave, as shown at B. This makes no great practical difference, and the repairer had better leave the end straight than attempt to hollow it out, working as he is by hand without dies or forms.

#### METHODS IN EXPORT TRADE

**Purchases Induced by Considering Foreigners' Convenience—Busy Men Will Not Translate.**

There are some elementary principles of foreign trade, which, although enunciated in almost every commercial article written upon this subject, still permit of constant repetition. First, the language of the country in which sales are solicited should be used in all correspondence. Equally important in effect are the standards of weights, measures and prices. A busy man will not stop to reduce foreign weights and measures to his own standard, and frequently he who does makes vital errors. The metric system is the only one understood in many parts of Europe, and the American seller, without conforming to this standard, leaves the first chances of even courteous consideration of his goods to the amiability of his prospective buyer. The result is that, in one-half of such cases, the letter goes to the waste basket. Continental nations have a decided advantage in this respect. They use the same standard of weights and measures. This is one of the most important lessons our manufacturers have to learn. If, in foreign trade, United States manufacturers and exporters would use the currency and measures of the country, there is every reason to believe that results would justify the original trouble and expense.

Prices must be made free on board at some well-known seaport of this country; even better in attracting trade, the price should be given at the European port of arrival, or some statement as to sea freight should be made. This information would enable the purchaser to approximately determine the cost of the goods after arrival in his store, and this he must know before he buys. In many cases European buyers have been deterred from buying in the United States because they have an exaggerated idea of freight rates.

## EXPORT PACKING AND MARKING RULES ARE SELDOM OBSERVED

### Annoyance and Losses Caused by Indifference of Our Shippers—Uniform Rule for Countries South

One of the chief complaints against the exporters of the United States is that they do not pack their goods for shipment in the manner in which they are explicitly directed to arrange them. This subjects their customers to great annoyance, and both the exporters and importing firms to pecuniary losses. The result is that both present and prospective customers are driven to other markets. A case in point is that cited by a Venezuela paper in a recent issue. The article contains hints as to the manner of packing and an explanation of why different kinds of merchandise should not be in the same package when passing through the custom houses of Central and South American countries. In view of the interest awakened by the present exhibition of United States productions in the warehouse of the Manufacturers' Association at Caracas, such warnings to merchants and manufacturers who anticipate trade with our sister republics are timely.

#### Fined for Shipper's Error.

The above mentioned paper states that quite recently the customs authorities at La Guaira found themselves obliged to impose a heavy fine on a firm at Caracas which was in receipt of a large quantity of goods coming from the United States, and which did not in anything correspond with the consular invoice. The result was the house had to pay a fine of \$200 and undergo all sorts of unpleasantness. It is painful to have to say, continues the paper, but it is a fact, that in the United States only the commission houses trouble themselves about packing. Meanwhile it remains a vital point for those who wish to trade with Venezuela, and other South American countries as well, and unless they manage to learn this branch so as to meet the exigencies of the customs in those countries they cannot hope for success.

#### Goods Should Not be Mixed.

Double the amount of care should be taken in packing goods for the South and Central American trade that is exercised in preparing goods for shipment to domestic markets in the United States. Packages should be new, clean, and neatly packed, and suggestive of new and attractive goods inside; and while sufficiently strong and durable, the question of weight, which figures materially in the matter of customs dues, should not be overlooked. It is also necessary that goods of a kind be placed in the same package and not mixed with other goods. Duties are levied on the gross weight, and determined upon the highest priced article within the package.

#### Regulations of Southern Countries.

On this subject Cycle Age published an article on February 17, which is herewith reprinted:

Much delay and displeasure is experienced by both shipper and consignee in shipping bicycles to the South American countries, due to the ignorance of the shipper regarding the packing rules and regulations in vogue in the various countries, and as the volume of trade between the United States and the countries to the south of it increase these complications will naturally multiply. To obviate the difficulty a set of regulations bearing on the subject has been compiled from public documents, and is herewith presented:

There is no restriction whatever placed on marking in any of the countries, with the exception of Colombia, Ecuador, Honduras

and Nicaragua. In the countries named it is necessary to be restricted to one uniform mark for each consignee. Two marks will require two sets of bills of lading.

In Brazil, Chili, Honduras, Peru, Uruguay and the Argentine Republic, each package, piece, etc., must bear one individual mark, each differing from the other.

In Bolivia, Colombia, Costa Rica, Cuba and Porto Rico, Ecuador, Guatemala, Hayti, Mexico, Nicaragua, Paraguay, Salvador, Santo Domingo and Venezuela, the regulations provide that packages of the same kind may be numbered alike. But manufacturers are warned not to mix two different kinds of packages under the same number. The following countries require that gross and net weight be given in the metric system for each package: Bolivia, Chili, Colombia, Costa Rica, Guatemala, Hayti, Honduras, Paraguay, Peru, Salvador, Santo Domingo, Uruguay, Venezuela and Argentina. In Ecuador, Nicaragua and Cuba and Porto Rico only the gross weight for each package is required. In Brazil and Mexico it is required that gross weight of package, net weight of parcels inside of packages, and actual weight of goods shall be in the metric system.

Relative to contents, only one kind of merchandise can be packed in one package sent to Argentine Republic, Brazil, Bolivia, Cuba and Porto Rico, Ecuador, Peru, Salvador and Venezuela. In Colombia, Costa Rica, Guatemala, Hayti, Honduras, Mexico, Nicaragua, Paraguay, Santo Domingo and Uruguay, packages may contain several kinds of merchandise packed together, but the net weight and measurements of each must be supplied. Several kinds of merchandise may be packed together for shipment to Chili, and there is no restriction as to the supplying of the weight and measurement of each.

From these regulations it will be found practical to devise one uniform rule for shipment to Central and South American countries, which can be followed in all cases and will save the trouble of looking up the special regulations for each of the republics. The general use of kilograms instead of pounds to designate weight must, however, be one of the features of the rule.

## SOUTHERN TRADE ENTERPRISE

**Season is Long in South Carolina but Dealers Carry Sidelines—Roller Skating Rink Opened.**

Columbia, S. C., Nov. 5.—The conditions of trade in this section may be readily summed up. Repairs are on the increase, as the weather is almost ideal for riding. Second-hand bicycles are in active demand and prices are, as a rule, well maintained, although considerable excitement has been created by recent announcements of '99 prices. The 30-inch wheels are not regarded with favor by local riders, most of whom will bestride a 28-inch mount in '99 as they did this season.

As wheeling is good in South Carolina except two months of the year, side lines to carry over dull times are not strictly necessary, however desirable they may be in some respects, but six of the seven dealers in this city carry them, nevertheless.

One dealer, J. D. Strong, has made arrangements for a roller skating rink, which is to be opened today and is equipped with Raymond's Improved skates.

### Motor Vehicle Race in Russia.

The first road race for motorcycles in Russia was run from Tsarskoye-Sselo to Strena and return—about twenty-five miles—on October 23. There were six starters, and all the machines were tricycles. Two had accidents. The others finished in the following order in the times given: Belajeff, 1:33:36; Merle, 1:45:36; Stepanow, 2:04:00.

### HAWAII AND THE PHILIPPINES.

Send four cents (in stamps) for an illustrated booklet issued by the Chicago, Milwaukee & St. Paul Railway, the direct route across the American Continent to the New Trans-Pacific possessions of the United States. Full of latest reliable information and valuable for reference. Can be used as a text book in school. Address Geo. H. Heaford, Gen'l Pass. and Ticket Agent, Chicago, Ill.

# Fauber 1899 Hanger.

NEW IDEAS—NEW PRICES.

**MANUFACTURERS** who used Fauber Hangers were very successful and well satisfied.

**DEALERS** found them good sellers and bicycles fitted with them not dead stock.

**RIDERS** appreciate the simple and practical construction of the Fauber Hanger and the advantage of a standard article for which you can get any necessary repairs.

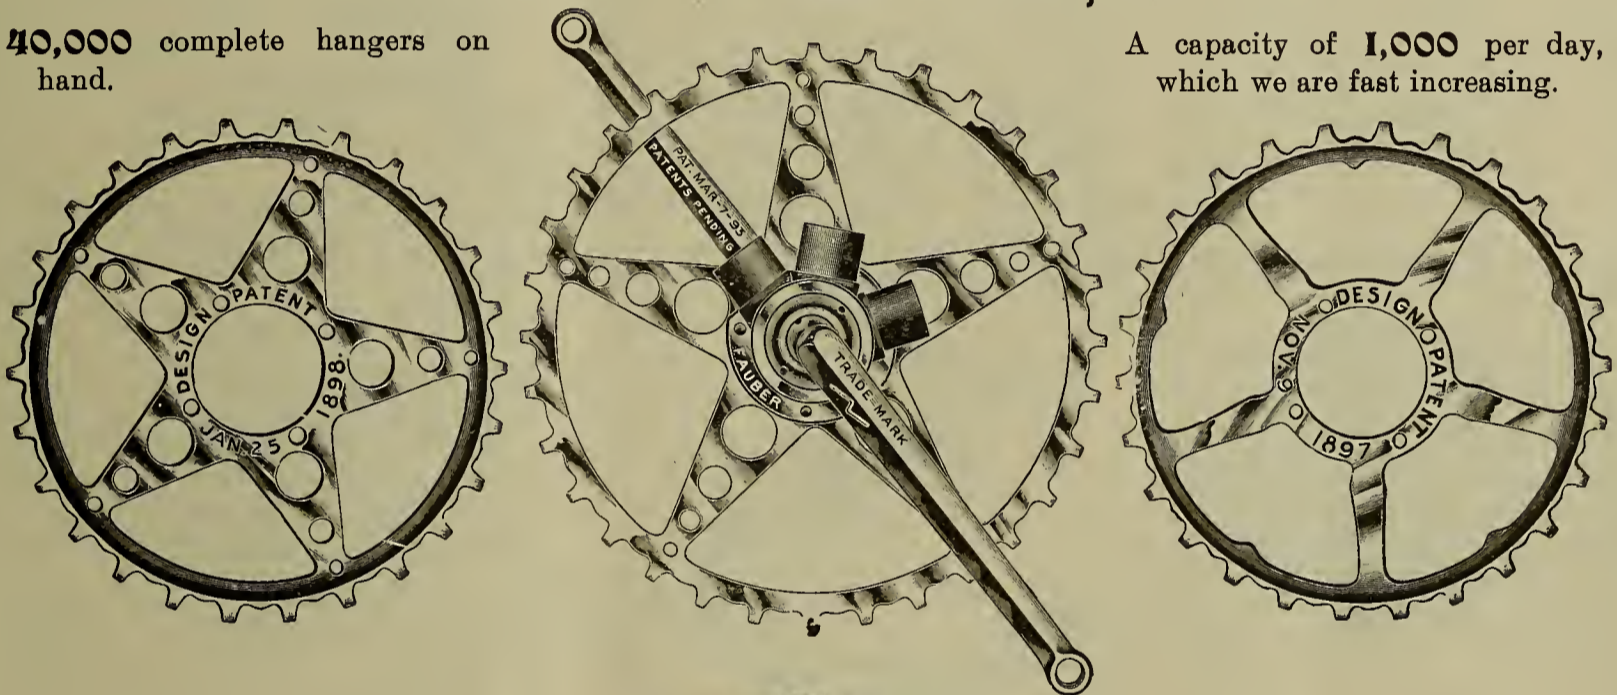

We are **Pioneers** in the manufacture of **One-Piece Crank-Axles** and own more than twenty allowed and pending patents. The **Success** of the **Fauber Hanger** is unparalleled in the bicycle trade.

## OUR RECORD.

## RECENT PATENTS

## New Brakes in Two Types — Screw Making Tool For Ordinary Lathe—Chainless Designs

**Coaster-Brake.**—A clamp bracket is secured to the rear forks and near its lower end is mounted a rock-shaft upon which the brake-arm is fixed. A spiral spring wound around the rock-shaft and attached to the brake-arm serves to hold the brake out of action. The brake arm is in line with the sprocket wheel plane and its forward extension carries a tooth which in the normal position of the parts is out of the path of travel of the sprocket wheel. A second tooth is so mounted in a slot in the arm as to be lifted and thrust aside to the inner extremity of the

slot by the rotation of the sprocket wheel. When, however, the sprocket is rotated backward the movable tooth is engaged by a sprocket tooth and the brake arm is turned on its shaft until the fixed tooth comes into engagement with the sprocket. The fixed tooth thus bears the strain of the application of the brake. In order to permit backward rotation of the front sprocket unhindered by the progress of the machine the rear sprocket is mounted on a ratchet clutch. The spring holding the brake out of action is sufficiently strong to permit the rider to rest his feet on the pedals while coasting. The inventor is W. D. Robinson of Philadelphia.

**Cuntz's Chainless.**—This is a construction, intended for bevel-gear bicycles, in which the power-transmitting shaft is not run through one of the lower fork sides. The bearings of the shaft are left accessible for adjustment without removal or detachment of any of the parts. Some of the various cross-sectional shapes which

may be used for the tie-rod that takes the place of a tubular forkside are shown in the illustration. The patent carries ten claims and is numbered 613,621, dated November 1. The inventor is H. F. Cuntz of Hartford, Conn., assignor to Pope Mfg. Co. of the same place.

**Thread-Cutting Tool.**—The device is intended for cutting threads by attachment to an ordinary lathe. The tool consists, essentially, of the combination of a shank adapted for adjustment in the usual way in the tool-post of a lathe, a movable head or bit-holder connected with the shank at an angle, and means for imparting a reciprocating movement to the head, whereby the cutting-bit carried by the head may be applied to its work from

time to time as the depth of the thread progresses. The outer end of the tool shank is chamfered and has a dovetail groove and a projection to connect with the bit-holder formed to correspond. For convenience of assembling the parts and to compensate for wear and readily take up any slack that may for any reason occur between the parts, a key-plate is provided to fill the space between the dovetail tongue of the shank and the wall of the groove in the movable head and one or more set-screws. The parts are to be coupled, held, and guided firmly one upon the other, but so that the head may be freely moved forward and backward upon the shank. Means for operating the movable head consist of a screw, engaging the projection on the shank, and a bracket, connected with the movable head. The screw itself is operated through a thumb-wheel. The cutting-bit is firmly held in its socket by means of a clamping-plate and set-screws. For means of gaging the forward movement of the head with relation to the shank, a bracket and an adjustable screw are provided. "In operation the shank of this tool is adjusted in the same way that an ordinary tool is adjusted in the tool-post, the movable head of the shank is arranged at the angle of the screw-thread, and thus as the differ-

ent cuts are made the side of the cutting-bit will move forward in a right line at the proper angle and the cut will be taken or made by the beveled end of the cutting bit," explains the inventor. "In other words, there will be only one cutting edge for cutting a thread, whereas according to the usual system both faces of the angular point of the tool are cutting edges. In cutting the thread the shank is clamped in the tool-post and the cutting-bit adjusted in contact with the surface of the stock to be threaded, the screw being adjusted so as to firmly clamp the head of the shank and yet permit of free forward movement of the head, then setting up the feeding-screw and starting the lathe. The cutting-bit will enter the work and take off the first chip. Then withdraw the movable head and return the work to the starting point, again set up the head to bring the cutter in engagement with the stock, and repeat." The inventor is John E. Goddard of Spencer, Mass.

**Sterling Chainless.**—The accompanying illustration shows the general features of improvements in bevel-gear transmission designed to facilitate adjustment and positioning of the pinions. Previous patents by the same inventor have been the foundation for the special features in the

chainless bicycle made by Sterling Cycle Works. The patent is numbered 613,282, of date November 7, and carries three claims, of which the first and second are as follows:

1. In a machine of the class described, the combination of a longitudinal intermediate driving-shaft, a bracket portion in which it is held and mounted provided with longitudinal perforations, a bearing portion movably mounted in the bracket portion, an adjustable ring on the exterior of the bracket portion provided with projecting lugs inserted through the longitudinal perforations of the

same and arranged to contact the bearing portion, and means for adjustably holding the adjustable ring in position.

2. In a machine of the class described, the combination of a main-frame portion, a rear-fork portion, a driving wheel provided with an axle screw-threaded into one part of the rear-fork portion and with a polygonal head at the opposite end thereof, a removable piece dovetailed into and forming a continuation of the other rear-fork portion provided with a transverse perforation to fit the head of the axle and adapted to embrace the same and hold it in position, and means for clamping and holding the removable end of the rear-fork portion and thereby the axle in position, substantially as described.

The inventor is F. A. Kershaw of Kenosha, Wis.

**Rear Wheel Foot Brake.**—A short fork is clamped to the lower portion of the lower frame tube. Between the members of the fork is pivoted a block, the free end of the block being provided with a loop for the reception of the brake-lever, the forward end of which is provided with foot-rests, by which the same may be depressed. At the free end of the rear curved extension of the lever is mounted a roller-brake. A wire spring holds the brake out of action when not depressed.

By adjusting the brake lever within the loop which embraces it the brake may be adjusted according to the size of the particular bicycle frame to which it is desired to fit it. The invention might readily be modified, it seems, so as to cooperate with coasters attached to the lower frame tube. The inventor is S. S. Goldman of St. Louis, Mo., assignor of one-half to F. F. Espenschied of the same place.

## ROAD CONTACT OF WHEELS

### Means Employed for Obtaining Adhesion by All Wheels to Uneven Road Surfaces

The Whitney steam wagon of which the engine portion and driving mechanism were described and illustrated in last week's issue of this paper, furnishes by its construction of other portions an example of the special care which is required in the construction of the carriage body and the supporting truck of motor vehicles in which the wheels are geared to the power, and which are not to the same degree necessary in ordinary carriages the wheels of which are rotated by ground contact.

#### Slight Rise of Body and Load.

Whitney's one grand objective point, is the production of a wagon which will run on common roads with perfect safety and certainty. With this point in view, he has devoted much thought to the steering lever, and has given great consideration to the springs and frame, with the result of producing a frame which is very strong for its weight, and which supports the wheels in such a manner that they are absolutely free to accommodate themselves to any road surface, however rough and uneven, with the smallest possible vertical rise and fall of the wagon body and the load which it carries. This problem of individual wheel rise or fall is not freely understood by all 4-wheel road wagon makers. In the case of a tricycle the problem does not appear, because the three points of support can always remain relatively in one plane, and yet will always, all three, touch the road surface, no matter how uneven it may be. But in the case of the 4-wheeled carriage it is of the greatest importance that the load shall be raised and lowered to the least possible extent by road level variations, and this "least load lift or drop" is better obtained by the construction used by Whitney than by any other method known to the writer.

#### Question of Front or Rear Driving.

There is, perhaps, an admitted question as to whether in a 4-wheeled vehicle, the front or the rear wheels shall be used as drivers. Morris and Salom and perhaps others, assert that the front wheels should be drivers and the trailing wheels should be used to steer with; this arrangement has been patented by Salom, and is used in the New York Electric cabs. Other motor wagon makers do not view this point as of great importance, and adopt the more natural method of making the rear wheels the drivers. There seems to be but little practical difference in the results obtained. With some forms of mechanism, such as wheels or rollers running on cams, which wheels are supported on the free ends of pivoted levers, the relation of the point of lever pivoting to the direction of the cam rotation is of the utmost significance, so much so that such a chain of elements may operate with perfect smoothness where the motion of the cam surface is from the lever pivot toward the cam wheel or roller carried by the lever, while with a reverse construction, making the cam revolution from the wheel towards the lever supporting pivot, the cam could not be forced to make a revolution. Something of this sort does doubtless belong to the action of a set of driving and driven wheels on an uneven road surface; but the road surface must be extremely uneven before any detrimental action of this sort takes place. Under ordinary road conditions a four-wheeler

seems to run about the same with either front or rear wheels made the drivers, and hence it may be considered good practice either way, with leading drivers or with trailing drivers.

#### Advantages of Pivotal Construction.

But a free lift or drop for two of the wheels of a 4-wheeled carriage is of real and undeniable importance. Suppose all four wheels to bear equally on a level road, and that a single elliptic spring, set crosswise, supports the front part of the wagon, all in the usual manner, and suppose, also, that there is no provision made in the wagon frame for permitting the front wheels to rise independently. Under these conditions, let one of the front wheels be lifted a foot. If the wagon frame is rigid two of the wheels will then clear the ground; these two cleared wheels may be either the two front wheels, or one front wheel and one rear wheel, depending upon the load distribution. Again, suppose the two front wheels to be carried on axles forming the extremities of a beam pivoted in the middle horizontally so as to permit a free vertical movement of either wheel: as before let one front wheel be lifted 12 inches; the result is that the other three

Fig. 1—Showing front axle and elliptic spring.

wheels remain on the road surface, each bearing its normal load, while the middle part of the front of the wagon frame is raised 6 inches, and the back part of the wagon is not raised at all, thus making the total lift of the whole wheel load, if the wheel load per wheel is equal to begin with, 3 inches only. But with a rigid axle support and equal wheel loads to begin with, the whole load is raised 12 inches at one end, which is equivalent to lifting the entire load 6 inches, instead of 3 inches, as is the case with a pivoted front axle permitting free individual vertical motion to the front wheels. There is a third case, in which the wagon frame is not absolutely rigid, but is elastic and can be twisted to a greater or less degree by raising one front wheel, the other three wheels standing on a level plane. In this third case the total lift of the whole load is greater than with the free front wheels, and less than with the rigid frame, proportionately to the resistance which the wagon frame offers to twisting.

#### Load Lifted Over Obstructions by Motor.

The importance of this load lift will be apparent when it is remembered the load lifting must be done by the motive power. Hence we may say, roughly speaking, that it takes about twice the power to surmount a given road obstacle with all four wheels carried on a rigid frame, which is consumed in surmounting the

same obstacle when the steering wheels are on pivoted axles so as to give them a free rise and fall. True, if there were no friction, and rise and fall were exactly equal, then the lifted wheel in running down the incline after the top was reached, would act to propel the wagon, and there would be no loss of driving power due to the rise and fall of one wheel of a 4-wheel carriage over a double incline. But this supposition is entirely outside of obtainable conditions of practice, and the only safe procedure is to consider anything which lifts one wheel as an obstacle, demanding an effort of the motive power to lift the whole load a certain distance, and returning nothing for the subsequent down hill effect.

Assuming this reasoning to be correct, the vast importance of a free front axle vibration in the vertical plane at once becomes apparent.

Supposing, however, once more, that the body of the carriage be made to serve as the wagon frame, as is often done, mounting this body on two springs disposed lengthwise of the body on the rear axle, and on one front axle spring, disposed crosswise of the body. This front spring permits a small lift of either front wheel with very little more total lift of the load than if the front wheels were absolutely free to lift vertically. But if the obstacle is large, then the front spring strongly opposes the front wheel rise, and thus causes a much greater total load lift than would occur with a free front axle.

From all of this it appears that to meet the conditions of common road driving, the front axle should be pivoted so as to give either front wheel a free lift.

#### Absolute Rigidity of Rear Axle Desirable.

Another part of this problem relates to the rear axles and the frame and the motor. Here absolute rigidity is greatly to be preferred so far as the action of the motor on the driving wheels is concerned; to secure this unchanging relative position of the motor and the driving wheels, the motor is often mounted directly on the rear axle. Here the pneumatic tire comes in. So far as the art of the motorcycle is defined at the present time, the use of the pneumatic tire seems to be clearly indicated. In addition to this, it is well known that the pneumatic tire should carry the least possible load. Up to, say about 250 pounds load per wheel it is easy to obtain durable pneumatic tires. As soon as this load is exceeded troubles begin, and increase rapidly with every pound of increase of dead load on the tires. But if this tire load can be carried on springs placed between the load and the axle, the destructive effect of the load on the pneumatic wheel tires is greatly mitigated. Hence it is not favorable to long tire life to mount the motor directly on the rear axle, if the motor is of any considerable weight. The better way is to place as little dead weight as possible on the wheel axles, and place springs of the easiest known form between the wheel axles and the load.

#### Three Varieties of Springs.

Springs may be divided broadly into coiled springs, half elliptic springs and full elliptic springs, the coiled springs being the harshest in effect, and the full elliptic being the softest, and hence most favorable to long tire life. Still softer than the full elliptic springs are the various well known forms of C-springs, compounded with linked half-elliptics, but for the sake of simple and substantial construction, there is a strong tendency among motorcycle designers to use only the three forms of springs mentioned, the coiled spring, the half-elliptic, and the full elliptic. Once more, there are two forms of the full elliptic spring, one having each member shaped in substantially

# Jobbing Bicycles

TOLEDO, OHIO.

a single curve, while the other form has each half formed with one middle curve joined by two reversed curves which form the ends of the springs; this 3-curve form is by far the more delicately elastic, and is therefore the more suitable for use in a motorcycle, as it absorbs vibrations due to small differences in the road surface height much more perfectly than the single curve form.

#### Springs Supported on Pedestals.

All of this reasoning leads to the Whitney steam wagon frame, as shown in Figs. 1 and 2, which are oblique, front and rear views, taken from two different wagon frames, one with and one without tires.

Beginning at the rear axle, see Fig. 2, Whitney raises pedestals therefrom which support the two rear full elliptic 3-curve springs, and connects these pedestals by a substantial cross tube; from this rear cross-tube two horizontal side tubes lead forward, which are connected by a cross-tube in front, see Fig. 1, and by a third intermediate cross-tube located a considerable distance to the rear of the front one. The front elliptic spring is bolted to the top of the front cross-tube, as clearly shown in Fig. 1.

#### Pivotal Arrangement of Front Axle.

Whitney's front axle is composed of a chevron-bent tube, reaching upward in the middle nearly to the under side of the front cross tube of the frame, to which it is pivoted by a horizontal pin, axially disposed lengthwise of the wagon, the front axle having its bow-strung girder form completed by a straight tension rod underneath. Whitney's very peculiar and effective steering bar is supported at its lower end by a radius rod, jointed to the front axle support at the right, and to the horizontal part of the steering lever at its inner end; this radius rod forms the fulcrum of the steering lever, the links from the free end of the steering lever lower arm being seen in the rear. The steering lever joints must be universal, and are of very complicated construction, which need not be specified in detail here. As so far described, the whole bow-string girder which supports the front axles is perfectly free to vibrate in a vertical plane, but is very meagerly supported against fore and aft stresses. To give the fore and aft support, two oblique truss tubes lead from near the top of the wheel axle pivots upward and backward until they meet in an eye at the midcross-tube of the frame, to which they are pivoted by a free bolt in the prolongation of the horizontal axial line of the pin which pivots the axle girder to the front cross bar, and about 24 inches or 30 inches to the rear thereof. This gives perfectly supported front wheel axles, carried on widely separated free joints, and rising and falling to suit road surface inequalities in the easiest and most perfect manner possible.

#### Compensating Gear and Brake Drum.

From the rear cross-tube of the frame, pendants are dropped to support the compensating gear, and at the lower ends of these pendants the forked chain adjusting strut is pivoted. Whitney's brake drum, see Fig. 2, is not formed on the side of the compensating gear box, but is placed on the right hand section of the rear axle, presumably to bring it in direct line with the brake treadle in front and thus carry the brake rod in a straight line past the boiler. This is a faulty arrangement, as it makes the brake act principally on the tire adhesion of the driver only.

The springs of Whitney's No. 3 wagon are particularly good, and I have never ridden in another automotor so little affected by Belgian block pavement, or so smoothly riding over rough and deeply rutted country roads. Whitney reached his very superior frame construction through a long course of severe practical

tests, and he has great cause to be proud of its perfect adaptation to all the varying conditions of road service.

#### Chain Drive Still Unsatisfactory.

Whitney's first drive was a cycle chain, half-inch blocks, with small sprockets; the chain width and sprocket diameter have been gradually increased, step by step, until he is now using a rear axle sprocket of about 20-inch diameter, 2-inch pitch, 40 teeth, 1-inch working face. The front sprocket, on the engine shaft, has eight teeth, and is made of machine steel, case hardened. The large sprocket was made from a blank of boiler plate steel weighing well towards a hundred pounds to begin with, and whittled down to 16 pounds finished.

The chain is of Jessup tool steel; the chain blocks are not solid, but are made up of five smaller pieces, each 1-5-inch thick; the chain rivets are of 1/2-inch diameter, Stubb's steel. The side links are 5-32 of an inch in thickness. This formidable power transmitting chain does not give promise of long life, and Whitney does not regard it as meeting the conditions of its use. The object of making the chain blocks in five sections instead of one piece is to increase the twisting flexibility. All of the chains Whitney has used have been short lived, and he believed the rapid wear was due to chain resistance to twisting. This laminated block does make a chain which twists a little way readily, but it does not seem to wear any better, or at best not very much better, than the solid block chains. Whitney has also tried

Fig. 2—Showing rear axle and spring arrangement.

large spur gearing, of far more strength and wearing surface than the power of his engines demands, and a few thousand miles of travel sufficed to wear these gears out so that the teeth bent. I myself believe that all of this trouble with chains and gears both, would cease if all of the working parts were enclosed in a perfectly dust proof casing, and it appears to me that it should not be a difficult matter to apply such a casing to Whitney's transmission elements.

The Whitney steam wagon No. 3, which I am most familiar with, weighs about 1,120 pounds, with gasoline for 75 miles and water for 30 miles on board. The tires are very heavy, 3-inch diameter being used with 100 pounds air pressure.

HUGH DOLNAR.

### BOSTON MOTORCYCLE CONTEST

#### Ten Competitors Enter for Trials—Electric Vehicle Makers Want Short Runs at High Speed.

The Massachusetts Charitable Mechanical Association, in connection with its exhibition of motor vehicles at Mechanics' hall, in Boston, has announced a contest of motor carriages to take place at Charles River park on November 9. The prizes aggregate \$1,100 and the object of the trials is to determine the practicability and adaptability of motor vehicles for all purposes where the ordinary horse and carriage is now used, and the following points are to be given consideration by the judges in making their report: Speed,

manageability, simplicity of construction, brake efficiency and grade climbing.

In considering these points the judges are instructed to recognize that the art at present is in a somewhat crude state, mainly in the hands of the inventor, and the newer types of motor vehicles will receive as careful consideration as those older and better known.

Ten competitors are named, representing electric, gasoline and steam driven wagons, and the contest should be of great interest, although it is scheduled to take place on a four-lap cycle track of the wash-bowl type. The makers of electric vehicles do not want more than five miles at top speed, as that distance is about their limit. The steam and gasoline wagons of course want long runs, as the electrics can outfoot them for a short distance, but would be nowhere in a long distance competition. The two classes of carriage, those driven by storage battery and those driven by heat motors of any type, are so wholly different as to make the devising of a really fair competitive test between them difficult. For a few miles the electrics can make the best time, so that they would show well against the gasoline and steam wagons, while in a long run the electrics would exhaust their storage batteries and be forced to fall out of the race.

The greatest interest will attach to the rivalry between gasoline carriages and light steam motorcycles, which will be shown on this occasion for the first time.

### MOTOR VEHICLE INQUIRIES

#### Parties Wishing to Handle Motorcycles in a Commercial Way Seek Information Not at Hand.

Cycle Age is in daily receipt of inquiries in regard to motor vehicles. The development in the new industry is so rapid, however, and withal so uncertain, that the information on hand cannot always be relied upon as being up to date and unbiased.

Until further inquirers will therefore find their questions reproduced in these columns and manufacturers may answer them by mail through this paper accordingly as the address of the inquirer is given, or otherwise.

Among the latest communications are the following:

Editor Cycle Age: I have read many interesting articles on motor cars in your paper and would be obliged to you for asking some of the makers to make us offers, especially for vehicles which work without noise. Any possible inventor of a motor driven by explosion of flour or sawdust (?) is also requested to write.

A. Schubert Mfg. Co.  
Stockholm, Sweden.

Editor Cycle Age: Kindly forward to Stanley Brothers, whose address was not given in your recent article on their steam road wagon, our request for further details and representation of the wagon in Holland and her colonies. Van Rosendaal & Co.,  
The Royal Dutch Metalware Works,  
Nijmegen, Holland.

Editor Cycle Age: Can you give us any information in regard to a motor carriage that will carry from 6 to 8 people (we don't want an electric machine). We have not noticed anything in Cycle Age of that size. We don't want anything with less than three seats. Rex & Dean,  
Novelty Machine Works,  
East Liverpool, O.

It was mentioned in Cycle Age some time ago that the Reeves Pulley company of Columbus, Ind., constructed large steam power motor vehicles, one with capacity for 20 persons having been shipped to Dakota. Several companies are undoubtedly prepared to manufacture large vehicles to order, especially the Duryea company in Springfield, Mass., and Peoria, Ill.; American Motor company, 32 Broadway, N. Y.; Pittsburg Motor Vehicle company, Pittsburg, Pa.; Winton Motor Carriage company, Cleveland.

# INFORMATION FOR BUYERS

## STERLING MODELS AND PRICES.

The 1899 prices announced this week by Sterling Cycle Works are in line with the prices made by other manufacturers of standard first class machines, the chain models being quoted at \$50 and the chainless at \$75. Several important changes in construction embodying up-to-date ideas have been made in the Sterlings and the company anticipates that with quality unimpaired and prices reduced there will be a largely increased demand for these machines and is preparing for the coming season with this in view. Mannesmann tubing of larger diameter than that formerly used in Sterling frames has been imported for use the coming winter. Frame joints will be made flush and the hangers will have 2½ inches drop. All nickeling will be over copper and the enamel will be hand polished.

## STEARNS LOCKING AUTOMATIC STAND.

A bicycle stand and lock that is admirably adapted to use in storage rooms in office buildings, factories, schools, clubs and other places where space is limited has just been brought out by E. C. Stearns & Co., of Syracuse, N. Y. Two styles are made, one having the long extension of the upper part as shown herewith and the other terminating at the third set of arms, but the mechanism

of the locking arms is identical in both. The pressure of the tire against the rear ends of the movable arms releases a spring which causes them to automatically close around the rim. The ends of the arms are provided with small rubber tired rollers that prevent marring of the enamel or varnish of the rims. The novel feature of the Stearns stand is its adaptability to the different positions of the bicycle. It will be commonly screwed to the wall to receive the rear wheel, but may be placed on the floor if desired.

In places where economy of floor space is a desideratum, it can be secured to the wall at the right height to grasp the rim and tire of the front wheel while the rear wheel rests on the floor at the base of the wall. Still another manner of use is to secure a series of them upon a plank supported about a yard from the floor on posts or iron pedestals furnished by the Stearns company. In this position the bicycles can be arranged upon either side with the front wheels supported in the locks and the rear wheels resting on the floor. This affords a very compact storage arrangement of the bicycles, which saves almost 50 per cent of the floor space, as the sidewise measurement over two machines is little more than that of one when both wheels are on the ground.

## THE THOR ECCENTRIC HANGER.

Aurora Automatic Machinery Co., of Aurora, Ill., is distributing its catalogue of component cycle parts for 1899. The newer goods shown are the Thor Perfection hubs, Thor two-piece hanger and Thor eccentric hanger. In the Thor eccentric hanger the Aurora people have dispensed with the lugs on the bottom bracket for clamping the eccentric

in place. This gives a smooth, finished appearance to the hanger and obviates the objectionable weakening of the bracket by splitting. The mechanism for adjusting and tightening the eccentric in the bracket is ingenious. A block is fitted between the flanges of the eccentric and conforms to the

shape of the inside of the bracket. A hole is drilled through a lug on this block at an angle of 6½ degrees and an inside sleeve, drilled at the same angle and screw threaded clear through, is provided to fit in the block but is cut a quarter of an inch shorter. A screw bolt with hexagonal head passes through this mechanism. As the block and sleeve, when assembled, make an angle of 13 degrees, a few turns of the bolt suffice to release the clamp so that the eccentric can be revolved with a special spanner. The side plates fit outside of the edges of the bracket and make a smooth finish. The Thor two-piece hanger, patented in August of the present year, is intended to be used with this mechanism, for which patents are pending.

## M. & W. LAMPS AND PUMPS.

An acetylene gas lamp called the Lancaster constitutes an important part of the line of cycle goods made by Matthews & Willard Mfg. Co. of Waterbury, Conn., for the coming season. This new lamp has a patent water trap and gas seal device which is claimed to render unsteadiness of the flame impossible and to prevent the water reservoir becoming hot; also it has a combination water and gas cock which automatically turns off the water by the same turn of the cock that subsequently shuts off the gas and preserves it for future use. The employment of this cock, the makers state, makes it unnecessary to turn off the water twenty to forty minutes before one wishes to dispense with the light. Another important point on which superiority is claimed is a detachable fish-tail burner which can be readily removed and cleaned. It is the policy of the company for the ensuing year to sell these gas lamps to a selected number of jobbers only, to whom electrotypes for catalogues and advertising purposes will be furnished. The M. & W. kerosene lamp, shown herewith, has not been neglected through bestowal of attention on the acety-

lene lamp, however. The combustion has been made more perfect, an automatic wick lock operated by pushing the turn button inward has been provided, and the oil pot is made reversible and securely locked so that it cannot become accidentally detached from the lamp. The other articles catalogued in

a folder which this company is sending to the trade, are the No. 310 double stroke, Silver Tone, and Monogram bells and the M. & W. combination pumps, constructed to carry a complete charge of carbide for any gas lamp, or a repair kit consisting of a quick-repair tool and cutter, tube of liquid cement, and one or two plugs. The section of the pump in which these articles are contained is opened by turning the knob at the end, which unscrews the metal cap. Instead of having its efficiency diminished by this novel combination arrangement, the makers state that tires can be inflated with this pump in much less time than with the ordinary hand pump.

## FORSYTH WRENCH AND PEDALS.

A new style of wrench is one of a large line of bicycle parts and accessories manufactured by Forsyth Mfg. Co., of Buffalo. This wrench is called the Buffalo and is drop forged. It resembles other wrenches in which the inner jaw is movable, except that the usual knurled screw is replaced by a large knurled collar screw threaded internally and slotted nearly all the way around to receive the head of a screw that is screwed into one side of the movable jaw,

which has two extensions that are arc-shaped to conform to the inner diameter of the collar. The threads of this collar have been cut away longitudinally to form a channel through which the rack in the handle may slide freely when the collar has been turned backward to the farthest point allowed by the head of the screw in the annular slot. By this construction the movable jaw can be set up against the face of a nut and when the collar is turned to the right the threads engage with the ratchet and force the jaws up tighter against the nut, which adjustment it holds until released. The advantage lies in the saving in time effected by changing the adjustment from small to large nuts. Another article of the Forsyth line is the adjustable pedal, which has double sideplates, the outer ones being stamped in one piece and slotted to receive bolts that attach it to the smaller plates riveted to the cross piece. The slots allow a variation of ¼ of an inch in width to fit shoes of different sizes. Other pedals of the same line are non-adjustable, but the bearings and body in all

are alike, the barrel being of tubing of large diameter with cups pressed into its ends. This company also makes a stamped chain guard whose several parts are riveted together and which is adjustable to fit different machines. It is very light but sufficiently strong, and being handsomely nicked and polished, is of attractive appearance. The pedals, wrenches and other goods are equally well finished and are strongly made, as shown by the samples submitted for examination.

## THE NEW TRIBUNE LINE.

The folder giving specifications and prices of the new Tribune models is being sent out by the Black Mfg. Co., of Erie, Pa. The three leading models will retail at the popular prices for 1899 standard bicycles. These are of symmetrical design and attractive appearance, and the makers state that they consider them and the entire Tribune line the best they have ever offered. The standard diamond frame roadster is made in 21, 23 and 25 inches height of frame, has 2½ inches drop of hanger, 7-inch cranks, drop forged flush connections, detachable sprockets of 26 and 9 teeth respectively, is geared to 80 and weighs 22½ pounds. The drop-frame roadster is made in 20, 22 and 24-inch sizes, has hangers dropped 3 inches, has 22 and 9 tooth sprockets and is geared to 68. A 30-inch wheel model is

# JUST A MINUTE WITH THE CLAUS BAR

That's all we need.

That minute will accomplish for the Claus Bar what an hour, day, week, month, year cannot accomplish for any other bar.

It doesn't take people long to recognize a good thing---you have looked at the Claus. You have recognized it, haven't you?

It's the sidewise and upwise taper of each corrugation that clinches the "clinch of a brazing." It can't budge.

Study a year and you cannot

find a weak point on it---anywhere.

It is not like other bars---it "don't" break---wont break---simply can't break.

It is not a bit like other adjustable bars, because it can be adjusted without a wrench---all you need is a thumb and finger.

And, another point---at all adjustments the chest expansion remains the same.

All the parts interlock. They'll sing the song "you can't loose me."

It requires only a Claus bar to have a complete handle bar stock. No matter what kind of bar a man wants you have it in the Claus.

It is a bar for anybody --- everybody --- any taste---every taste.

We are preaching

the gospel of the Claus bar all over the world.

Old riders will change to it---new riders will want it.

We are telling people that if they insist the dealer will furnish it. And they will insist---we are telling them to do so.

A manufacturer or dealer cannot well afford to equip his wheels with any other bar.

He need not. Our prices are right. Write for them.

## The Claus Handle Bar Mfg. Co.

MILWAUKEE, WISCONSIN.

THE CLAUS ADJUSTMENT.

This is the adjustment  
Simple and strong,  
That makes other adjustments  
Appear very wrong.

THE CLAUS PLAIN STEM. EXPANSION STEM.

These are the stems  
Expansion and plain,  
That help in giving  
The Claus its good name.

This is the bar  
All complete,  
That other bar makers  
Concede they can't beat.

Patented in America and all  
Foreign Countries.

built similar to the regular roadster for men except that the frames are 23 and 25 inches high, the gear 78 and weight 23½ pounds. The price is the same. The Blue Streak racer has hangers dropped 3 inches, has 28-tooth front sprocket, 7-inch cranks, 87 gear, and weighs 19 pounds. With the above mentioned models option is given on Tribune, Palmer or Dunlop tires. Two medium-priced diamond and drop frame models are also made which differ from the regular roadsters principally in equipment and in the lack of the latest improvements in fork crown and adjusting devices which distinguish the higher priced machines. Other models which complete the Tribune line are a combination and racing tandem and a triplet. The racing tandem is

geared to 84 and weighs 35 pounds. The triplet has 86 inches wheel base, hangers dropped 1½ inches and weighs 58 pounds.

The three leading machines of the line—models 42, 43 and 44—embody a number of new features in cycle construction of which detail illustrations are promised later. The flush joints with 'outside connection are shown in the accompanying sectional drawing of the seat post cluster, which also shows the novel internal seat post binder working on a new principle. Turning the screw threaded ring in the top of the connection forces down the free or upper end of the band or collar whose edges are at irregular angles to its sides, and as the lower end rests on a shoulder in the connection a binding effect is produced around the post.

#### THE NEW TRINITY MODELS.

Trinity Cycle Mfg. Co., of Keene, N. H., will make three grades of bicycles for next season, of which the regular roadsters will list at the standard price for first class machines, while a lower grade line will sell for \$35 and the racers for \$65. All of these will bear the Trinity nameplate, will have the Trinity forks, diamond-shaped cranks, star sprockets and be fitted with the new style Trinity direct spoke hubs. The adjustment arrangement on all models will be simple and of a style that the company has tried and found effective. The machines will have short heads, deep drop of hangers, two-piece cranks and will present a rakish appearance. The company's traveling men are starting out through the east and west with complete lines of samples to show the trade and have a number of new and interesting points to call attention to. The new Trinity direct spoke hub will be manufactured for the jobbing and manufacturing trade to compete with other medium-priced hubs, so that makers and jobbers who desire to use this style of hub can compete with the ordinary flanged hub.

#### PAKE PEDALS ONLY.

Cycle Components Co., of 9 Maiden Lane, New York, is exclusively engaged in manu-

facturing a line of pedals, of which Rodger B. McMullen & Co., of New York and Chicago, are sole selling agent. Two styles of these pedals are shown herewith. The first is the Alvin, whose barrel and cross pins are made of single forging machined down.

The ends of the pins are spun over to hold the side plates, which are a one-piece stamping, bent to shape. This construction makes a pedal of great strength and durability. Cups are pressed into the ends of the barrel and the inner cone is formed on the pin while the outer one is screw threaded on and locked with a ring and nut. A dust cap closes the end. The pins and bearings in the second pedal are the same, but the barrel is formed of heavy tubing expanded at the ends after the stamped arms have been put on. Two longitudinal ridges are pressed in the side plates on either side to strengthen them. All these pedals are made of good steel, the balls and cones being of tool steel case hardened, and the nickeling is over copper. Parts are interchangeable and can be replaced when required.

#### WHITE LINE FOR 1899.

Introducing its '99 catalogue to the trade, White Sewing Machine Co. calls attention to the fact that it has never sought to attain a phenomenal "mushroom" growth by sensationalism, but the progress that has been made is the result of careful study and labor in every department of the business. In the new models it is not the aim of the company to equal past merit, but to exceed it as much as the added knowledge of the year's business will permit. A new feature of the road wheels is the construction of the crank hanger, which is unique. Each cup is pressed into the bottom of one section of a pair of sleeves which screw together in the middle to form a barrel enclosing the whole bearing mechanism. This barrel is securely locked into the bottom bracket by long transverse bolts acting through lugs on either side of kerfs in the bottom bracket. By this construction the White people apparently solve the mooted question of disc-adjusting bearings, getting the acknowledged advantages of fixed cones and at the same time getting cups that can hardly get out of

alignment. Adjustment is effected by loosening the clamp bolt on the left hand side and turning in or out the left half of the barrel. The cones are large and are secured to the ends of a sleeve of tubing, forming in effect a single piece. The axle slides through the cups and cone sleeve and is brought to its proper position by a nut on the left side, which locks the cones and shaft together.

Two chainless models, made under the Pope license, are shown, but prices are not quoted. Besides these and the two road machines, the White racer is catalogued.

#### WELL MADE CYCLES FOR CHILDREN.

A four-page folder showing the Iliion models of juvenile cycles for boys and girls made by Remington Arms Co., 313 Broadway, New York, is being distributed. These machines are made light in weight and easy running, but are of a quality of material and workmanship designed especially to withstand the hard use to which juvenile machines are subjected. They embody all standard modern improvements and are finished and equipped in a manner that is unusual for goods for children.

#### STANDARD TOOL CO.'S WELDED PARTS.

Parts made by the electric welding process are illustrated and described in an attractive price list just issued by Standard Tool Co., of Cleveland, O. The line, which is only one of many this concern produces, embraces front fork sides, rear forks and stays cranked to different angles, combination rear forks and stays welded to the end lug. L and T seat posts so welded as to appear as one piece, chain adjusters, and handle bars welded to the stem with flush joint and shipped straight for individual bending. The company commands attention by its observation that "a saving of several brazings produces an economy beyond any other method." Any goods that contribute to economy in the factory, while being in no way inferior to simi-

lar goods in the matter of serviceability, style and finish, are eagerly sought; it is on the knowledge of this that the Standard company is making its bid for trade. Another factor contributing to economy is that the welding process produces a smooth finish and consequently can be plated at reduced expense. Unusual strength is also claimed for the "homogeneous" steel tubing from which the Standard forks and bars are made. Other lines of manufacture by this company include twist drills, reamers, chucks, milling cutters, taps, spring cutters, flat spring and riveted keys.

#### THE PEERLESS BELLS.

Bristol Bell Co., of Bristol, Conn., is bringing out for next season a new line of bells called the Peerless, which it proudly states promise to exceed in elegance of design and finish all past efforts in this line. The complete line as illustrated in the catalogue consists of four new styles, distinctly varied and

admitting of special finishes. This combination, with the feature of the new adjustable lever described in the October 27 issue of Cycle Age, will greatly add to the already well established reputation of the Corbin bells. The aid of a tool is not required; simply turning the gong to the right locks the bell. In attaching, the lever may be turned in either direction, then turning the gong both fastens the base plate and clamp to the handle bar and fixes the lever at the point desired. The clamp consists of two rigid jaws which close together and draw up into the base or saddle part of the bell, with a double action, admitting a quick and easy adjustment to any handle bar varying in size from 5/8 to 1½ inches.

#### THE SENTINEL BICYCLE LOCK.

An ingenious bicycle lock, which will no doubt find very general favor with wheelmen, is now being introduced by Yale & Towne Mfg. Co., 9 Murray street, New York. As shown in the illustration, this lock is intended to be permanently fastened to the steering-head of a bicycle, and is designed to hold the front wheel at an angle to the frame, thus rendering it impossible for the bicycle either to be led or ridden away. The locking mechanism is that of the well known Yale pin-tumbler type, which makes the number of key changes practically limitless, thus absolutely precluding the possibility of other keys being in existence which may fit the lock. The lock is of neat design and finish. A number of bicycle manufacturers are

expected to fit these locks as a special feature for the coming season; but they may be easily applied to any machine. While shown in the present cut attached to the head by a separate band, the Sentinel lock may also be used directly behind the name plate, the latter being employed as a band to secure it to the head. One of the largest bicycle manufacturers in the country, having an extensive export trade, has undertaken to introduce the lock throughout Europe.

#### IMPORTED HARD RED TIRE CEMENT.

The American Trading company, 100 William street, New York, announce a new policy in regard to the marketing of Hard

Mention The Cycle Age

Red tire cement. This cement has been known for a number of years to the American public, being supplied in large quantities to a large tire house which made it favorably known as the only good hard cement for securing tires to wheel rims. It was and is manufactured in England, where it is known as Bourne's cement, but the importers, The American Trading Co., will henceforth try to sell it in this country to jobbers and retailers, direct, as the tire firm previously handling it has started manufacturing cements and discontinued the use of the imported article. Selling directly to the trade the importers now offer reduced prices and guarantee that the cement will be maintained at the quality known to the trade until the close of last year. The firm invites inquiries and is desirous of having the goods listed in jobbers' catalogues. A liquid cement will also be offered the trade under the name of Liquid Gutta Percha and will be sold in original packages.

#### THE SANGER ADJUSTABLE BAR.

Samples of the new handle bar here illustrated, which is being brought out by Sanger Handle Bar & Plating Co., 194 East

THE CYCLE AGE

Water street, Milwaukee, Wis., are just ready for delivery, and stock deliveries in quantities will commence December 1. The construction and operation of the bar are readily understood from the drawings. Particular attention, however, is directed to the fact that the semi-circular ratchets on the ends of the two bars engage each other when the bar is assembled, and by the reciprocating action thus produced both bars are simultaneously adjusted to the same angle by the movement of one, leaving the other hand free to lock the adjustment. The reverse side of the bar ends have annular toothed faces to engage those shown in the rear of the stem head, and when the two are brought together by the binding bolts, further movement of the grips in a vertical direction is impossible. It will be noted that the heads of these bolts are provided with a small stud to enter a corresponding hole in the end of the bar, to prevent rotation of the bolts when the nuts are being tightened. The heads of these bolts are large in diameter and flat, and set down into the circular openings of the head so that a flush surface is produced and any tendency to play of the bars is overcome. One other good feature of the Sanger bar upon which much stress is laid by the makers is the fact that the angle of the grips remains constant, and there is no longitudinal alteration of their position with relation to the saddle, the movement being entirely in a vertical direction.

#### CAST HOLLOW FORK CROWN.

The Racine Malleable and Wrought Iron company, of Racine, Wis., manufacture the hollow cast fork crown shown in the accom-

panying illustration. It requires little machining except at the fork stem connection.

#### PREPARING FOR INCREASED BUSINESS.

The Eclipse Bicycle Company has recently made arrangements for the production of a large number of medium price bicycles at Oneonta, N. Y. It has secured the services of W. H. Ives, who has been manufacturing

bicycles under the name of Empire State Cycle Co. for the past few seasons, in a limited way, and they will build all the medium grade cycles their trade demand at Oneonta, under the supervision of Mr. Ives. All the stock for these machines is being purchased by Eclipse Bicycle Co. at their office in Elmira, and a general supervision of the work will be given by the Eclipse people. They are to occupy the plant formerly used by the McKammon Piano company with a floor space of over 300,000 square feet, and a large quantity of medium price machines will be produced. They will be known as the Waldorf.

#### G. & J. TIRES IN CANADA.

Arrangements have just been completed whereby the American Tire Company, 166 King street, west, Toronto, Ontario, become the licensees and manufacturers of G. & J. tires for the Dominion of Canada. These tires are made under the direction of the Gormully & Jeffery Mfg. Co. and are exact duplicates of the American tire, both in style and sizes. Under this arrangement it is possible to ship bicycles equipped with G. & J. rims into Canada, and through the American Tire Co. the complete tires can be procured there. G. & J. tires made in the United States must not be shipped across the border line, however. All persons so exporting said tires into Canada will be liable to suit for infringement. It is for this reason alone that this arrangement has been made. By the present means it is a very simple matter to ship bicycles with rims only and have legitimate tires put on in Canada. The agreement with American Tire Co. makes the price of G. & J. tires in Canada lower than ever before.

#### THE '99 W. & E. EXPANDER.

The Walker & Ehrman Mfg. company has recently moved its works into a larger factory where its facilities for turning out work in large quantity and promptly are much increased. The company caters especially to the jobbing and large manufacturing trade, and makes the well known W. & E.

hubs, pedals, crank-hangers, turned head fittings and frame fittings for tandems, triplets and quads. For the expander shown in the accompanying illustration it is maintained that it contains no pins or nuts that may be lost, that all screw threads run in the same sense, that it contains no loose parts that might drop into the frame tubing or be misplaced, that all parts are interchangeable, being turned to hardened gauges, and that it has one-eighth-inch more binding surface than any other expander. These claims are further supplemented by the important statement that the expander will allow for more variation in the dimensions of seat posts and handlebar than other devices and still positively hold.

#### CLAUS BARS IN EUROPE.

Claus Handle Bar Mfg. Co., of Milwaukee, Wis., which has several representatives in Europe, reports that large foreign orders are being received for the Claus bar. This bar came into popularity last year, and the makers predict from the present indications a large demand from the trade and riders the coming season. A feature that commends this bar to the public is its adjustability while riding, besides which the material used and the workmanship are of first-class quality.

#### COLE & CO. BUY ADDITIONAL FACTORY.

G. W. Cole & Co., of 141 Broadway, N. Y., announce that they have recently purchased all the rights, title and interest in the fixtures and business of the Victor Mfg. company, of Detroit, Mich. The leading products of this concern are the Victor Concave Nipple wrench, Lullaby baby seats, Hercules combination lock, Hercules hand pump and Asbestoline. Col. W. G. Latimer, who was proprietor of the company, sold the business because he was unable to attend to it, owing

to his having been mustered into active service at the head of his regiment. Cole & Co. have also acquired control of Basch's patent hook toe-clip, which is so constructed that side slipping is absolutely prevented. The new catalogue of the Cole company, which is in preparation, besides the Three-In-One, Pacemaker, and other well known articles, will show a number of novelties for 1899.

#### RUSHING WORK ON BALDWIN CHAINS.

By working day and night forces and with the aid of improved machinery and increased facilities, Baldwin Chain Co., of Worcester, Mass., is making strenuous efforts to keep abreast of its fast growing trade and hopes to be able to deliver goods early and fill promptly all orders. The past season has been a most satisfactory one for the makers of the Baldwin chains, who nevertheless have reason for anticipating increased business during the coming season.

#### COLUMBIA MOTOR CARRIERS.

Pope Mfg. Co. of Hartford, Conn., has published a pamphlet describing the carrier vehicles shown in the accompanying illus-

THE CYCLE AGE

tration. The merchandise capacity of the vehicle is rated at 500 pounds under which it will give its regular speed and power. The structural strength, however, is sufficient to permit a load of 600 or 650 pounds, although under this extra weight the motor will not develop its normal speed. The form and design of the carrying bodies are not necessarily as shown, but may be varied to suit different requirements. The two styles illustrated show wide variation between a light motor truck wagon and a closed-up affair such as would be suitable for a dry goods establishment. The motor is a specially designed gasoline engine for which no water jacket or other cooling device is necessary, thereby saving many complications and much weight, says the company. A supply of gasoline which is sufficient for about 100 miles travel is carried in a tank attached to the frame between the boxes. Like all gas or gasoline motors, the first explosion must be obtained by physical effort, and bicycle cranks and pedals were adopted to give the desired result in the easiest and most satisfactory manner. By the attachment of a clutch with chain and sprocket to the shaft of the driving wheels, foot power may be used to assist the motor when on steep grades, obtaining higher speed than the auxiliary low gear of the motor would

THE CYCLE AGE

normally produce. When the cranks and pedals are not in use they remain stationary. The normal weight of this carrier vehicle is given as 750 pounds.

#### ECLIPSE PRICES FOR 1899.

Eclipse Bicycle Co., of Elmira, N. Y., announce that their prices for 1899 are to be as follows: Model 64, men's light roadster, \$50; model 65, ladies' light roadster, \$55; models 52 and 53, men's and ladies' roadsters, 1898 pattern with 1899 improvements, \$40; model 24, Waldorf light roadster, \$35; and model 25, the Waldorf light roadster for ladies, also \$35. The company has concluded to put its best efforts into the manufacture

## A MOWING MACHINE

costs more than a scythe—but it cuts more hay.

A fine tire costs more than a cheap—but it rides faster and farther. What made the solid tire give way to the cushion—the cushion to the pneumatic? For precisely the same reason the slow pneumatic is bound to give way to the fast.

Nobody wants slow tires; nobody buys them knowingly. And it isn't good, sound business to let people do it unknowingly. If you don't tell them, somebody else will, and they get the impression that they've been cheated.

League Tires need no explanation. Nothing goes into them but the finest rubber and fabric; nothing comes out but speed and staying qualities. "Get there and get back" tires look well in the store, ride well out of the store, and, present or absent, are working steadily in somebody's interest—yours, if you handle them.

### LEAGUEKIT

mends any single tube tire. Quick and sure cement repair for small punctures, quick and sure plug repair for large ones. Only tool that does the work of two kits at price of one. Write for prices.

of only two patterns at the Elmira plant. In the company's Oneonta plant it will produce Waldorf bicycles in large quantities. Both the Eclipse and Waldorf cycles will be fitted with the Morrow Automatic coaster and brake at an extra list of \$10.

#### IMPROVED CLEVELAND MODELS.

The new models of Cleveland bicycles, whose reputation of numerous improvements consistent with the maintenance of last season's prices has gone before them, are out and are now being shown by H. A. Lozier & Co.'s traveling salesmen to agents all over the country. In a few weeks the company will be making deliveries. Regarding the changes in the machines, the makers furnish the following information:

The frame head of Model 66 is larger than formerly, but flush from end to end; the projecting ball cups are flushed into the head out of sight. In doing this, the head adjustments are made neater and more ornamental. The gauge of tubing has been increased, adding to the strength of the frame. The gauge of the top is 22. The seat post mast is 22 gauge, while the lower front tube is now 20 gauge. The front fork forging will be made the same weight as that used on Model 29 in 1897. By thus slightly lightening the fork forging and increasing the strength of the frame, in case of hard head-end collision, the fork forging will bend before the frame will buckle, and the frame will remain unharmed. The crown forging and fork stem will be threaded, the stem screwed into the forging and brazed. The hubs are all formed out of single pieces of cold-rolled steel by means of powerful cupping presses. An entirely new straight spoke has been introduced, the hub end of which terminates in a ball of about 1/4-inch diameter having a lug extension in the plane of the spoke. This ball can be inserted in the spoke hole in the hub barrel when the spoke is at right angles to it, but after the spoke is turned at a tangent the lug engages beneath the edge of the hole and renders it impossible to pull the spoke out. Burwell bearings have been improved by the use of ball separators having rollers to take up the friction. Weights will be slightly less than in 1898. The Cleveland gear case has been improved and will be recommended to general use for road riding. Burwell tires of 1 1/2-inch diameter will be regularly fitted. Cranks will be 6 3/4 inches long on men's wheels, with option on 7-inch.

#### NEW TEST FOR CLINCHER CYCLE TUBING.

Clincher cycle tubing has undergone many severe and critical tests, conducted by disinterested parties who were investigating the claims to superiority put forward by the makers of this tubing, The Wilmot & Hobbs Mfg. Co. of Bridgeport, Conn. At one of the most convincing of these tests, as well as the most recent, a pair of rear forks made of Clincher tubing, was exposed to an endwise compression test in a regular power testing machine in comparison with a pair of forks made from seamless tubing of the same diameter, size and gauge. Under a pressure of 1,400 pounds the seamless tubing buckled and bent. The Clincher tubing only gave way, after being subjected to a pressure, applied in precisely the same way, of 2,400 pounds. These rear forks were then sawed off to shorter dimensions and again exposed to the same test. The seamless tubing bent and yielded at 1,700 pounds pressure, but the Clincher stood the strain till 3,200 pounds was reached, when it buckled slightly. The Wilmot & Hobbs company have recently finished very large additions to their already extensive hot and cold rolling plant with a view of taking care of their rapidly increasing Clincher business, and are already running day and night.

#### BIG FOREIGN SHIPMENT OF SNELL CYCLES.

Toledo, Nov. 7—On Monday Snell Cycle Fittings company made a shipment of 1,000 cycles to Malmo, Sweden. The bicycles were loaded in five express cars. They arrived at New York Tuesday and were at once loaded on a Wilson line steamer. On each car was a big banner with the following words: "Snell Wheels, American Machine Import Company, Malmo, Sweden. Made by the Snell Cycle Fittings Co., Toledo, O." The Snell factory is running over time, 200 men being employed until 9 o'clock at night.

The Washington branch of Eclipse Bicycle Co. has ceased to exist as a branch, the business having been transferred to John D. Lasley, who has been the resident agent for the past sixteen months. The consideration was \$7,600, which was secured by a deed of trust chattel given by Mr. Lasley to Lucas P. Loving to secure David L. Whittier. Extensive improvements have recently been made in this establishment, which is one of the most prominent in the national capital.

J. B. Merrill, traveling representative of Waltham Mfg. Co., of Waltham, Mass., who has been in charge of the Boston store dur-

ing the absence of Manager Gash, has started on a trip for the company through his old territory, embracing New Jersey, Delaware, Maryland, and Virginia.

Thomas Hay, until recently of Hay & Willits Mfg. Co., of Indianapolis, has severed his connections with this firm, the makers of Outing bicycles, and will engage in the sale of bicycles in Indianapolis. The affairs of the Hay & Willits company, he states, are now in the hands of George and Edward Evans who have secured a controlling interest in the stock.

J. C. and H. C. Starr, who make vehicles and harness and sell bicycles and sewing machines and have been doing business in Decatur, Ill., for the past 43 years, have not removed to Ft. Worth, Tex., as announced in a recent issue of this paper, but have merely opened a branch house at Fort Worth.

A dry retort oven for annealing tubing with exposure to the air has just been installed in the Toledo factory of the Shelby Steel Tube Co. and plans have been formulated for adding piercing and rolling mill machinery during the early winter.

Washington Cycle Supply Co., of Washington, D. C., has been given the agency for the District of Columbia, for the lines handled by R. B. McMullin & Co. These lines include Garford, Hunt and Brown saddles, Indianapolis chains, etc.

Porteous Butler, 22 passage de l'Opera, Paris, France, is circularizing American cycle and motor vehicle builders with a pricelist of detached fittings for two horse-power motor cycles. He builds the Butler petrol tricycle.

Adams & Hart, of Grand Rapids, Mich., jobbers and retailers of cycles and sundries, are preparing a sundries catalogue for '99 and would like to hear from manufacturers who desire to be represented in the catalogue.

Frank White, one of the inventors of the quick curing process for rubber tires, formerly with New York Tire Co., is representing the Mossberg Wrench company, of Attleboro, Mass., on the road.

W. P. Murray, dealer in flowers, feathers and fancy goods, has had many inquiries from his foreign agents in regard to bicycles and parts, and has decided to add both these lines to his business.

The Clipper people, of Grand Rapids, Mich., have arranged to have shipments to agencies in Ohio made from their Cleveland depot for next season, so as to save time for the agents.

J. H. Toole, who has been for many years prominently identified with Liberty Cycle Co., of Bridgeport, Conn., has severed his connection with that company.

New Spalding models including a roadster, racer, chainless and a juvenile machine, are being shown to Spalding agents in the principal cities.

R. B. North, who has been employed at the Pope Mfg. Co.'s plant in Hartford, has been transferred to the Chicago office as assistant manager.

The Shelby Steel Tube company is to hold its annual meeting to-day, November 10.

#### TRADE NOTES.

A manufacturer of iron and steel wheels for baby carriages, velocipedes and tricycles in Toledo, is considering the advisability of establishing a similar factory in Kansas City and has written to the secretary of the Manufacturers' Association of that city suggesting association with local parties in order that the business may have a good standing from the start.

E. T. Weiant, a well known cycle dealer of Denver, and manager of the Denver branch of Overman Wheel Co., of Springfield, Mass., has purchased the stock of cycles and accessories of the Victor depot and has also been made general agent for the Overman Company for Colorado, New Mexico and Wyoming.

Wiese Cycle Co., one of the oldest retail firms of Philadelphia, permanently closed its doors last Friday, under execution of judgment for \$3,950 secured by Eva Maria Wiese against Kate S. Wiese, proprietor of

the business, on a note dated September 23, 1897.

A big gang of men were put to work on the roof of Tucker Bicycle Woodwork Co.'s new factory in Urbana, O., on October 27 and the plant is being rapidly pushed to completion.

The shops of Amos Whitely & Co., harvester manufacturers, at Springfield, Ohio, which went into the hands of a receiver four years ago, have been sold to Superior Drill Co., of Cleveland for \$66,700. They are said to have cost nearly \$500,000.

West End Cycle Co. has removed to new and commodious quarters at the corner of Fourteenth and I streets, northwest, Washington, D. C. This concern handles the Keating and Andrae, and is managed by K. von Rodenstein.

Marion Black, successor to Black & Pel-tier, cycle dealers at Fort Wayne, Ind., has consolidated with Meyers Cycle company of the same town under the firm name of Meyers & Black.

W. D. Hyatt, who for several years conducted a bicycle store in Hoboken, N. J., closed up his place of business and disappeared a fortnight ago and has not been heard from since.

A. R. Underwood has purchased the interest of his partner, M. C. Walls, in the bicycle and repair business of Underwood & Walls, of Plymouth, Ind., and will continue the business.

The two-story brick factory of New England Tricycle Co., in Tyler City, Conn., was totally destroyed by fire October 28, at a loss of about \$5,000, covered by insurance.

Hazleton & Love, of Washington, D. C., who handled merchandise and bicycles on the installment sale plan, have been burned out at a loss of \$3,000.

Andrew Brosius, of Ft. Wayne, Ind., has consolidated his bicycle repair shop with his brother's, and they will build bicycles during the winter.

Frank Louis Loeffler, bicycle dealer, of Revere, Mass., has filed petition of bankruptcy, with liabilities of \$4,625 and assets of \$3,162.

Mueller & Watson, of Indianapolis, have dissolved partnership, but their bicycle business will be continued under the same style.

Parker & Schneider, hardware and cycle dealers of Ann Arbor, Mich., have been succeeded by Moore Hardware Co.

David Johnston, of Ithaca, Ill., dealing in hardware and bicycles, has given real estate mortgages for \$2,500.

Harper Blizzard & Co., hardware and cycle dealers of Wauseon, O., have been succeeded by E. W. Blizzard & Co.

Schafer & Stahl, handling agricultural implements and bicycles in Butler, O., have dissolved partnership.

Mrs. D. E. Kreitlein has succeeded to the bicycle business of A. G. Kreitlein & Co., of Indianapolis, Ind.

J. Towhig Temple, dealing in bicycles and notions, has removed from Richmond to Greensboro, Va.

A. Bross has succeeded to the hardware business of Ailes & Caldwell, Advance, Ind.

Baker-Ogden Furniture & Hardware Co., of Oshkosh, Wis., has sold out its stock.

Ralph S. French, cycle dealer of Boston, Mass., has filed a petition in insolvency.

Charles M. Perkins, handling bicycles in Burnside, Ill., has gone out of business.

Kabaker & Debbs, bicycle manufacturers of Chicago, have dissolved partnership.

Oscar S. Lear, of Springfield, O., has discontinued his bicycle business.

C. E. Adams, who dealt in bicycles in Arlington, Vt., has died.

Punxsutawney Cycle Co., of Punxsutawney, Pa., has sold out.

# Don't Delay

In securing the Columbia Agency for 1899. One day's delay may result in your competitor getting it. If you are wise you will do one of two things **AT ONCE**. Either write to the Columbia Distributing Point in your territory or get on the train and apply for the agency in person. Any of our Branch House Managers will be glad to see you and will take pleasure in explaining fully in detail our line, policy and prices.

# Columbia

## Bicycles

are going to be easy to sell this season. From all sections we are receiving congratulations on the 1899 Prices and predictions of great business for Columbia Dealers. We are feeling good and so will you if you secure the Columbia Agency.

The Columbia Chainless at \$75 will be the most popular wheel on the market. Practical tests have demonstrated its superiority for all purposes—**either track or road.**

Columbia Chain Bicycles, Models 57 and 58 for \$50 are the best chain wheels we have ever built. We don't believe they can be equaled in **style, finish and quality.**

Columbia, Model 49, is well known as a light roadster or track wheel. With 1899 improvements at \$40 it is the best bargain we know.

Hartfords at \$35 and Vedettes at \$25 and \$26 will compare favorably in quality and style with most bicycles at any price.

**Don't Delay. Apply for Agency Now.**

# THE PASTIME AND SPORT

## French Favorite Wins.

Bourrillon, the champion sprinter of Europe for the season of '98, defeated Grogna, the little Belgian champion with whom George Banker is now touring Italy, and Deschamps, one of the best French riders of the season, in a match race at 2,000 meters in Calais, October 23. In the first heat Deschamps led off with Bourrillon following, but these two changed pace at every lap with Grogna last during the entire distance. At the bell the order was the same as at the

his pedals in a final desperate effort and won by inches only in 3:20 4-5. Deschamps ran third ten inches behind Grogna.

## Losers of Heats Win Final.

In the first day's races of the grand prize meet in Turin, Italy, October 22, George Banker, Pettis and Darlow were defeated in their heats. Broca, Meyers, Protin, Jacquelin, Singrossi and Eros qualified in their heats and Pettis, Bixio, Momo and Tomaselli qualified in conso-

## Racing Association Affairs Brighten.

Springfield, Mass., Nov. 7.—The affairs of the National Track Team Association are being gradually straightened out, and it is expected that a definite plan of settlement will be announced in a few weeks. The liabilities of the association will be considerably smaller than they appeared to be at the time of its collapse. There is also said to have been a reduction in the contingent assets, and the Springfield Bicycle Club, which it was claimed owed the association \$1,500,

start and remained so until the middle of the last lap, when Bourrillon began his sprint and easily passed Deschamps, finishing half a length in the lead. The time was 3:55. Bourrillon had the lead in the second heat until the last lap, when he made a feint to jump, which cost him the race, as Grogna was watching closely and jumped also, winning by half a length from Bourrillon in 4:40 3-5. The final heat was a repetition of the first Bourrillon and Deschamps leading in turn. At the bell the order was Deschamps, Bourrillon, Grogna. Two hundred yards from the tape Bourrillon began a brilliant effort, closely followed by Grogna, who passed him and seemed a certain winner until at ten yards from the tape the French favorite jumped on

lation heats. The final was won by Bixio with Momo second.

## Jacquelin Wins Foreign Riders' Prize.

In the races for the great foreign riders' prize, run at Turin, Italy, October 27, George Banker ran second in his heat and failed to qualify, but qualified in the consolation heat. The final was won by Jacquelin and Banker did not show among the prize winners. Summaries: First heat—Jacquelin, first; Banker, second; Seidel, third. Second heat—Broca, first; Mercier, second; Jaap Eden, third. Third heat—Protin, first; Meyers, second; Roanquette, third. Consolation race—Meyers, first; Banker, second. Final heat—Jacquelin, first; Meyers, second; Protin, third; Broca, fourth.

hopes to settle for about \$250. The National Cycle Track Association has been caused some annoyance by the confusing of the organization with the National Track Team Association. The Track Team Association is merely a combination of eastern track managers who are also members of the cycle track association.

## Class Motor Paced Records Alone.

Motor pacing is attracting a great deal of attention just now in Europe and is about to be tried in this country. There is no doubt that many existing records, particularly for middle and long distances, can be broken by riders assisted by mechanically propelled multicycles fitted with wind shields, but there is a

Our Business Is Built Up By

DEALERS IN

Clothing, Shoes, Jewelry and Bicycles.

TERRE HAUTE, Ind., Oct. 3, 1898.  
 NATIONAL CYCLE MFG. CO., Bay City, Mich.  
 Gentlemen—As our '98 season is now over, we take pleasure in stating a few facts. We have sold 274 National wheels this season. Of these one frame showed a slight defect in brazing at the seat-post connection and another had a clamp lug on the bottom bracket broken—both were repaired free of charge. We have broken only one fork side, one crank and can hold in one hand all the cups and cones which we have replaced. Haven't had a broken fork crown, a broken crank axle or a broken front or rear wheel axle.

This is a record that we can all be more than proud of. Defective wheels cause many a gray hair to come in the retailer's head, as if a rider has any trouble he comes into the store and turns himself loose like a cyclone.

We feel more than pleased with Nationals this year and hope that our business relations will be as pleasant in '99 as they have been in the past four years. With best wishes, we remain, yours truly,  
 HUGHES, WOLF & MILLER.

**SUMMARY.....**

- Nationals sold, 274.
- Frames broken, none.
- Fork Crowns broken, none.
- Front Forks broken, none.
- Fork Sides broken, one.
- Crank Axles broken, none.
- Wheel Axles broken, none.
- Cups and Cones broken, very few.

growing tendency toward not recognizing them in France or in favor of creating a separate class for them, as it is plainly unfair to give equal credit to performances with the two styles of pacing. The advantage naturally lies with the mechanically paced rider, for no time is lost through frequent changing of machines, and as the motor is indefatigable a perfectly steady pace can be maintained.

### FARMERS JOIN WHEELMEN

#### All Work Together to Secure Road Improvement Laws in Michigan.

Some of the older wheelmen of Grand Rapids, Mich., who have paid their membership fees into the League treasury for a number of years in the hope of seeing something done toward the passage of laws in their state for the improvement of wagon roads, are withdrawing their support from that body and combining with the farmers to elect a state congressional representative who promises, if elected, to introduce a good roads bill.

As a general rule farmers are antagonistic to wheelmen, but in this instance their interests are proving to be almost identical. The wheelmen can probably appreciate good roads more than any other class of people, but they are only slightly behind the farmer in this respect. The farmers realize that if they had good roads leading to the city they could haul twice as much produce to market with one team of horses as they can with poor roads to travel over. And they realize that the trip could be made in less than half the time. Added to these reasons for wanting good roads, the rural residents of the state are beginning to realize more and more what a boon free mail delivery would be to them. With it they could have letters directed to them placed in their hands within two hours after the train arrived at the depot, instead of waiting a week or two for a chance to get to the postoffice and get them. They know that this free mail service will never be theirs until roads are constructed which will permit easy travel by mail wagons, or mail carriers on bicycles.

### RULES FOR OUTLAW RACING

#### Form Proposed for New Organization Admits Pros to Membership—Important Changes Made.

A summary of the rules which have been drawn up for the government of racing under "outlaw" control next season has been given out by Arthur Gardner, vice-president of the A. R. C. U. These rules are subject to the action of the track managers, clubs and riders, who will meet in New York next month. The constitution and by-laws of the proposed new organization are embodied in the form, a summary of which follows:

All racing men competing with Union men shall be members of the order. Professionals and amateurs are admitted to membership. Amateurs are given an extension in territory, and may travel 100 miles from the boundary line of the state in which they live.

The prize limit on professional contests is removed and the rule compelling circuit meet promoters to place championship contests on the programme is abolished. Open competition along the circuit shall be the determined factor in deciding the championship. First, second and third places only will be counted, and the points given will be four, two and one. The grand circuit will open June 1 and close October 1.

Contests against records will be allowed at any time of the year instead of being confined to certain stated periods. The clause of the old rules requiring timers to make an affidavit before a notary is changed, and the referee appointed by the chairman will make an affidavit as to the accuracy of the timers.

### New York Division Election.

Count of the mail votes of the New York division L. A. W. last Thursday

resulted in the election of M. M. Belding, Jr., of New York city, as chief consul, and H. B. Fullerton, of Brooklyn, as vice-consul. For representatives of the First district Dr. L. C. LeRoy polled the heaviest vote, with Isaac B. Potter only one vote behind.

### TAYLOR BREAKS RECORDS

#### The Black Wonder Creates Four New Marks With Ease, Calling for Faster Pace.

Philadelphia, Nov. 7.—After having met with a rebuff from the management of the Willow Grove track, Major Taylor had some red-hot coals heaped on his head by the Woodside park management opening their gates to him for his record trials. They are being well repaid for their forbearance, however, for the colored wonder has not only brought four world's records to their track, but the indications are that he will, before many days, put every desirable short-distance world's record to its credit. His successful attempts up to date include the quarter-mile, third-mile, one kilometer and two-mile records, in :22 2-5, :29 4-5, :57 3-5 and 3:13 3-5, respectively—in the last-named case chopping no less than 7 2-5 seconds from the previous figures. Taylor is just now in excellent physical condition, and when his pacemakers get "on edge" the remaining records are bound to go.

Taylor will continue his record-breaking attempts during the coming week. After the conclusion of his track trials he will be sent by his manager after the Camden-Atlantic City road record, which is the most-sought-after mark within 100 miles of Philadelphia. He will be paced by four quints.

### McDUFFEE IN THE HUNT

#### Rumor Says He Will Go For Records on a Chainless Machine in Florida.

Philadelphia, Nov. 7.—It is said today that McDuffee will shortly gather together an outfit of northern pacemakers, take them to Jacksonville, and there attempt to lower any and all marks made by Taylor and others as well. He is said to be backed by a rival firm to that which employs Taylor, and that McDuffee will use a chainless wheel also.

McDuffee is now in Atlanta with his trainer, Charles Culver, who managed his pacing for him in his season's work in '98. He has a race on for Atlanta and will then go to Jacksonville for another, after which it is reported he will remain to go for the records.

A battle between Taylor and McDuffee for the records at their present stage and upon chainless wheels, would do much for that class of machines. There are at present but the two patents which are in use by the leading makers, and a record battle would do much to demonstrate the value of the two as regards speed qualifications.

Taylor is amply backed to carry on his battle all winter if need be, and his employers are not those to give up until the fight is won.

### CONCENTRATED POT-POURRI.

While Indiana L. A. W. members are pushing H. W. Foltz for first vice-president of the League, the Chicago contingent of the Illinois division have sought to recover the ground that was stolen from them by the Jerseyville members by securing George D. Locke's consent to oppose Foltz for the national office, which would allow the Chicago politicians to put up their own ticket for the state offices, with W. C. Malley as chief consul. Locke blocks the plan, however, by declining the invitation to withdraw.

Representatives of the L. A. W. in St. Louis have laid before the Board of Public

Improvement recommendations for changes in the street sprinkling contracts to be let for next summer, which propose that only enough sprinklings shall be made to lay the dust, not exceeding four per day; that carts shall be equipped with an ellipse of 2½-inch pipe having ¼-inch holes ⅝-inch apart; that a fine of 1 cent per fifty feet be imposed for too much or too little sprinkling; that certain streets frequented largely by cyclists be not sprinkled before 9 a. m. or after 5 p. m.; and that inspectors who fail to report excessive sprinkling be fined \$1.

Washington, D. C., Nov. 5.—For the second time within the past two weeks the New York-Washington record has been shattered. The new holder of the record is Harry Park, a well known road rider, who rode the distance, unpaced, in 25 hours and 45 minutes, which is one hour and forty-seven minutes below the record made by Louis R. Smith, also of this city, some days ago.

Promoters of the Madison Square Garden races have been studying to find a way to hold a six-day race in Chicago this winter without making themselves liable to prosecution under the Illinois state law prohibiting continuous races of longer duration than twelve hours.

St. Louis promoters are planning to bring McDuffee and Michael together in a match race in the Coliseum there this winter, evidently taking small stock in the reports of Michael's ambition to become a jockey and racing horse owner.

A record of 202 miles in 12 hours flat is claimed for Forrest R. Young of Brockton, Mass. Young is eighteen years old and made the trial Thursday. If the time is accepted it will establish a new 200-mile American amateur record.

Paul Lavand, the French match-maker, has wagered 1,000 francs that Joyeux will win the New York six-day race, and C. W. Miller has accepted the bet and will post his money with Paul Rousseau, editor of Le Velo, of Paris.

Bourotte, better known as "the Frog" in Europe, won a 50-kilometer (31 miles) race in Antwerp in 1:10:55 3-5 on October 23, with Miron second at 325 yards and Impens third at one mile.

The Austral wheel race meet at Melbourne, Australia, will be held November 25, December 3 and December 10. The three prizes in the two-mile handicap aggregate \$2,000.

Tom Eck is planning a circuit of indoor meets, to be held in Chicago, Milwaukee and St. Louis this winter. The races will be run under League rules and sanction.

"Pop" Elkes will run a six-day, six hours a day race at Troy, N. Y., beginning November 14. His son Harry will ride exhibitions during the race.

# THE CYCLE AGE

## AND TRADE REVIEW

VOL. XXII—No. 3.

CHICAGO, NOVEMBER 17, 1898.

NEW SERIES No. 52.

### POPE AND COLEMAN COMBINE PROTECT CHAINLESS PATENTS

**Formation of a Company with \$1,000,000  
Capital Stock Controlled by  
Pope Company.**

New York City, Nov. 14.—A chainless bicycle patent combination has been perfected by the Pope Manufacturing Company, its licensees and the Western Wheel Works, by the incorporation at Newark last week of the Bevel Gear Wheel Company, with an authorized capital of \$1,000,000. The announced shareholders are, of course, mere dummies for the present, though their names clearly indicate the powerful interests which are behind them. They are: Elliot Mason, the local Pope representative, \$999,000 shares of stock; Theodore F. Merseles, assistant to the president of the Western Wheel Works; Charles M. Richards, a salesman at the local Pope agency; William H. Miller, one of R. L. Coleman's bookkeepers; Frederick J. Stimson, who is Mr. Coleman's attorney, and Victor W. Hungerford, a Jersey man.

Definite details of the new deal are difficult to obtain. Mr. Mason will say nothing and Mr. Merseles referred the Cycle Age man to Mr. Stimson.

#### Arrangements Not Yet Completed.

"The affair is practically in a nebulous state," said Mr. Stimson, "and as counsel of the company I can make no statement as yet. When the arrangements are completed, I shall be pleased to give the particulars to the press."

It is understood, however, from the combination of various bits of information picked up here and there, that the corporation has been formed to control the existing patents on bevel gear bicycle construction, and that each user of the Pope patents will be responsible to the company for a royalty. The combination will not affect the announced price of the Crescent chainless at \$60. By entering into this combination Mr. Coleman has freed himself from the fighting of any suit to determine the validity of the patents, which in the event of his victory, would yield great advantages to others, who would bear no part of the expense of litigation.

#### The Foreign Outlook.

New York, Nov. 14.—Theodore F. Merseles, of the Western Wheel Works, having just returned from a European business trip, reports that from and after January 1 next, a tariff of \$5 will be charged on every bicycle entering Sweden; that after the coming meeting of the German parliament a duty of about \$5 will be placed on all bicycles imported; that the situation in Germany is so

critical for the bicycle industry that the increase in tariff is made imperative; that the situation in England is one of extreme peril, for makers and dealers alike are stocked heavily with machines, the best of which are offered to the public at from \$40 to \$60 net, the list price being \$125 and \$150. In France, however, the prospects for the coming year are, in the opinion of Mr. Merseles, very bright. American bicycles are popular in France, and are nowadays purchased in preference to English models, which, formerly, ruled the French and many another European markets.

#### MUST PAY FULL PRICE

**New York Judge Decides That Subsequent Price  
Reduction Does Not Affect Bicycle Purchase.**

Buffalo, Nov. 14.—A decision was recently rendered in this city that has a deep interest for dealers wherever located. A woman bought a wheel in April last for \$100. She paid \$77.50 down, and agreed to pay the balance in a short time. The very day that the bicycle was delivered to her, the price dropped to \$75. She declined to make any further payments, claiming that she had already paid more than the price of the wheel, at the time it was delivered to her. Suit was instituted to recover the balance due. The judge decided that the contract was for \$100 at the time it was made, and that the subsequent reduction in price did not affect the contract.

There is a growing sentiment, among the trade of this city, favoring abolition of the custom of giving free sundries to purchasers of bicycles. The local cycle board of trade will endeavor to reach an agreement that will cause the abandonment of the custom entirely or limit the articles to be given away.

The recent reduction in price of the chainless model has led to many inquiries about this particular model. Indications give point to the belief that there will be a good demand for this model next season.

#### Rim Makers Will Appeal.

The Indiana Novelty Mfg. Co. will appeal from the decision of the United States court, in Milwaukee, which held that two of their patents were invalid. They hold several other patents on wood rims, on which they have not yet brought suit.

### CONTEST OF MOTOR VEHICLES

#### TRIALS OF SPEED AND POWER

**Hundreds of Substantial Business Men  
Show Keen Interest in Work  
of Different Styles.**

Boston, Nov. 9.—About twenty-five hundred people gathered to see the automatic racing at Charles River Park this afternoon. The meet had been well advertised, and, considered purely as a sporting event, there was some general interest taken in it, but, not unexpectedly to the management, perhaps, when the gates were opened the people who trooped through were of a class far removed from the habitual race-meet attendant. To one accustomed to cycling and similar crowds the quality of the audience present at once forced attention. The absence of the very young man was apparent at a glance. Among the many thousands there were not more than twenty women.

#### Contemplate Abandoning Horses.

There were business men, merchants, bankers, and men of that class, who could afford a stable as part of their menage. Such looked forward to some entertainment, to be sure, but, primarily, they were there to examine into the merits and possibilities of these new affairs, as exemplified by the electric, gaso-Germany to Delagoa Bay are: First line, and steam arrangements whirling around the track before them. On most of them rested the burden of the daily expense of one or more horses and a cart or two, and the advantages of a horseless carriage with its trifling cost appealed to them. These, therefore, were deeply interested, but before auctioning off blooded stock and removing the stable in the back area they came to pass close judgment on the display before them and to note the practical defects in the workings of the machines displayed for their criticism. The manufacturers were anxious on their side that no virtues of the motor carriages be kept covered, as nearly all spectators represented possible investors.

#### Upholstered Carriages Favored.

The audience were interested mightily, and liberally applauded anything and everything at all worthy of attention. Some of the motormen seemed to be unfamiliar with the banking on the race-track, but the speed attained by the nimblest of the vehicles was sufficient to exhilarate the crowd. The smaller, more compact machines took their eyes. The tricycle, which was given its initial velocity by the rider in the regular cycling way, did not win the favor of the people as did the richly upholstered affair, so much like one of their own carts, with its two high seats and generally

### CONTENTS.

comfortable appearance. The steam carriage, well-proportioned and not too large, was not unfavorably commented on. It was neat-looking and, because of the speed with which it rolled around the track, the thin stream which trailed behind and evaporated in thin air was not regarded as a detrimental kite.

The absence of any outward evidence of motive power certainly, however, meets with favor among the people. The electricians, on that account, were nodded at approvingly as they flashed past. And as certainly does the public balk at gasoline. To the average man the word "gasoline" suggests explosions. You can't get the idea out of the ordinary man's head that gasoline isn't dangerous. This afternoon a flame four feet high blazed out of the tank of one of the gasoline machines present. It was smothered at once. To one experienced it meant nothing, but to the uninitiated upon the benches it was an exciting moment; and it condemned, forever, gasoline machines in the eyes of hundreds who saw the incident—condemned them beyond the power of any argument.

#### Manageability of Machines Admired.

One strong point brought out during the afternoon was that the new machine was far from being a cumbersome, unwieldy thing. The dexterity with which four-wheeled carriages were revolved and gyrated within the width of the track excited the enthusiasm of all present. This feature was a revelation even to some of those who have been watching and predicting the rapid advance of the motor carriage into public favor. To see an expert handler wiggle his carriage in and out among pairs of sticks barely further apart than the length of his rear axle was indeed a privilege. "Imagine turning your horse and cart like that," was the usual comment of the spectator to his neighbor. The winner of this contest turned up in a man on a tricycle. He was liberally applauded, although the appreciation expressed by the audience was more for the dexterity of the rider than the excellence of the machine. In the climbing contest the machines were allowed a flying start of twenty feet before they were sent up an incline that varied in grade from 15 degrees at the bottom to 36 degrees up the last few feet of a wooden structure 80 feet long. Two machines went the full length and bumped the safety girder at the top in no uncertain fashion. Some got part way up the incline and then stuck. After the gathering dispersed a sturdy looking bicycle rider tried to mount the incline on his wheel but could not make it after several attempts.

#### Keystone Cycle Works Burned.

The Keystone Cycle Works, located in West Reading, Pa., were completely destroyed by fire on Nov. 12. The loss is estimated at about \$75,000. The plant and buildings were partially insured. The concern made a number of factory changes recently, intending to considerably increase its output for the coming season. At the time of the fire, orders for over 5,000 machines were in hand. About 800 new models were destroyed. It is highly probable that the factory will be rebuilt at once.

#### Death of Leonard Voegli.

Leonard Voegli, who for several years held a responsible position with the Indiana Novelty Mfg. Co., Plymouth, Ind., died on November 13. In addition to his fine business qualifications, the personal worth of the deceased was such that his death is deeply felt both in the office and factory; and what makes the sorrow keener at his death is the fact that in a few weeks he was to have been married.

## HOOLEY DISCLOSURES ENDED

### COURT DISMISSES BANKRUPT

#### Titled Personages Make No Defense Upon Re-opening of Promoter's Case —New Revelations.

The examination of Ernest Terah Hooley in bankruptcy proceedings was resumed on November 2 in London and attracted much attention.

Martin Rucker, who was charged with contempt of court in endeavoring to induce Hooley to alter evidence which reflected upon the Humber company directors, was fined \$500 and costs and was further ordered to pay the money at once or go to prison. Hooley declared that Rucker, in behalf of four directors of the Humber company, offered him \$25,000 to change some of the evidence presented in the bankruptcy proceedings.

#### Testimony Causes a Sensation.

Hooley continued to testify to the amounts, large and small, paid to trustees and directors in connection with his promotions. He created a sensation by asserting that he paid Sir William Marriott \$5,000 for introducing him to the Carlton Club, and asserting later that he paid \$50,000 to the Marquis of Abergavenny, a prominent Conservative, for party funds. The witness did not know whether the money reached the party fund. Subsequently, Mr. Hooley explained that he paid the Marquis of Abergavenny \$25,000 first and then paid him a second \$25,000, because he was told that he had promised \$50,000. "But," the witness interjected, "that was a lie."

Continuing, Mr. Hooley testified that he paid \$5,000 to Frank Harris, editor of the Saturday Review, "to square a man named Blake, who threatened to publish something antagonistic to the companies."

The witness then said that Harry Marks, editor of the Financial News and member of parliament, induced him to invest \$110,000 in purchasing the London Sun. Mr. Hooley asserted that he never received a penny from this investment.

Sir Joseph Renals, formerly Lord Mayor of London, was mentioned by Mr. Hooley as among those who received \$25,000 for joining the board of directors of the British Embroidery company.

#### No Cross Examination Offered.

The bankrupt said also that Lord Ashburton paid him \$250,000 for a quarter share of his profits from September 30, 1897, to the last day of that year. On the other hand, Mr. Hooley paid Lord Ashburton \$50,000 for an introduction to a firm of solicitors willing to advance him \$460,000 at 3½ per cent.

As day after day Hooley interwove great names into his stories of unsavory transactions, lawyers clamored for opportunities to refute his allegations by cross-examination, and the court, anticipating a long rebuttal, allotted six days in the autumn for a hearing. When the receiver on the second day announced that he had finished questioning the bankrupt, the court inquired whether anyone desired to cross-examine him. But a heavy silence followed, and the court informed the bankrupt that he need not return unless summoned to do so.

Public opinion, in the light of the so-called "guinea pigs" resting their defense on perfunctory newspaper denials, has no alternative but to record judgment by default against many of the lords and gentlemen.

#### Bicycle Storage at Paris Exposition.

An appeal has been made to the directors of the Paris international exposi-

tion of 1900 in behalf of the cyclists by the Paris cycling daily, *Le Velo*, which suggests that storage quarters for 40,000 bicycles daily be provided for the accommodation of those persons who may be expected to visit the exposition on their bicycles. At a charge of 10 centimes (2 cents) per day, the 40,000 bicycles would produce \$800; and *Le Velo* states that on Sundays and holidays that number would be exceeded. Special accommodations for motor carriages are also asked for.

## BICYCLE THIEVES RAMPANT

### Lake Sailors Suspected of Conducting Organized Depredations in Buffalo.

Buffalo, Nov. 14.—From the first of April up to this date records show that three hundred and fifty odd bicycles were stolen in this city, of which less than twenty-five were recovered, and not more than half a dozen arrests were made where conviction and sentence followed. Many more were stolen that were not reported to the police, and these would bring the number close to four hundred for the season. The thefts averaged five bicycles daily and were made up principally of standard makes, indicating that the thieves knew what models were easiest of disposal and brought the best prices. One day in June the number reached sixteen machines, and from six to eight was an ordinary day's work. The machines were taken mostly from the racks of the stores and office buildings and during business hours, when it would seem that detection would be almost certain. Absolutely no trace of the thieves or the bicycles could be found, so cleverly was the work done and so successfully did they cover their tracks.

About the middle of the season when the thefts were heaviest a report reached here that some of the stolen machines had been traced to Chicago. This tended to strengthen the theory advanced by the police department that the work was being done by an organized band having its headquarters in some of the lake port cities where the bicycles were disposed of. This gang, or rather that portion of it which was at work here, was thought to be composed of sailors employed on the line boats that plied between the two cities, and whose custom it was to put in their shore time stealing bicycles, which were taken to Chicago and turned over to confederates who, after altering the general appearance of the machines, disposed of them and divided the proceeds with the sailors. Nothing, however, came of the investigation that was said to have followed, but a watch was set on the different boats and, when a few weeks ago a party of three sailors were arrested while trying to dispose of several sets of new bicycle tires, the police believed they had captured the main culprits, but they were doomed to disappointment, for all that could be proven against the trio was the theft of the tires from the steamer's cargo.

#### To Make American Parts in England.

The Yorkshire County Cycle Company, Ltd., is the title of an organization which has equipped huge works at Leeds, England, for the manufacture of tires and cycle parts for the wholesale trade. The plant is popularly believed to have been established in the interest of Pratt & Whitney of Hartford, Conn., because nearly all the machinery is supplied by this American firm. It will be operated throughout on the plan of American parts makers and will be a formidable factor in the competition against which American exporters of parts to England and the Continent will have to contend.

**COLORADO TRADE CHEAPENING****EFFECT OF NEW CONDITIONS**

**Only Dealers Catering to Wealthy Class Maintain Luxurious Stores—Chance for Chainless Machines.**

Denver, Nov. 12.—Next spring will probably see the bicycle business in Denver on a somewhat new basis. There will be little resemblance to the ways of the trade in the older days. Concentration, the disappearance of large profits and the persistent reductions in prices have combined to transform the business of the retail dealer. It is noticed that there are but two establishments in the city that still keep up the style and accommodations of the old times, depending a great deal on a good appearance and luxurious appointments to draw trade. One of these stores is as handsome a mercantile place as there is in the city. This dealer's trade is almost entirely among the club men and fashionable folk of the city, and it is plain to be seen that artistic decorations and comfortable chairs and all the accessories of a good lounging place are quite essential in the business. The fact that it is a good machine, as this one unquestionably is, appears to enter less into the success of the concern than that the purchaser there may approve the artistic surroundings and the circumstances of the transactions. One other dealer makes an effort to preserve the traditions of the trade in Denver, mindful of the times when plush and polished nickel and handsome mirrors were considered necessary to the conduct of a successful business in \$100 wheels. But for the rest, the appointments of stores have followed the prices downward till now almost any kind of a room is good enough and there is, in most cases, little attempt made to appeal to the artistic perceptions of purchasers.

**Scramble for Cheap Bicycles.**

This is one of the signs of the change that has come over the trade in Denver. Another is the scramble for the lowest priced stock of bicycles that can be had. What the limit will be in the matter of cheapness can hardly be guessed here. Said one dealer, who is preparing to open up a store next month: "I have had my turn at high priced wheels, and after a struggle I gave it up. I felt a certain pride in handling one of the best on the market, and I regretted deeply the tendency to run after the lowest-priced thing to be had. But that was not to be avoided. I shall have a stock ranging in prices from \$22.50 to \$50, and I bank on the \$22.50 machine for my profits next year. It will be a good wheel, too. Manufacturers, like dealers, have learned a great deal, and I think I can conscientiously tell my customers that as good a bicycle can now be made for \$22.50 as could at one time have been turned out for \$50, or even more. I think the low-priced wheels will be the popular thing next season, though of course there will be still a considerable demand for the top-notch products of the old established factories. It seems to me that the new conditions will help the chainless a great deal. The cheapening of the chain wheel to such an extent that almost the best wheel of that pattern will be within the reach of everybody will increase the demand for the chainless among those persons, and there are many of them in Denver, who want something a little finer and somewhat different from the average rider."

**Show Fever in Canada.**

The World's Meet Committee, of Montreal, Can., which has in charge the ar-

rangements for the international race meet to be held there next summer, is preparing to hold a cycle and motor vehicle show in Sohmer Park next February. It is intended to make this the largest bicycle exhibition ever held in Canada, and a number of motor vehicle builders have promised to exhibit. The show will be under the management of T. T. Cartwright, secretary of the Meet Committee, who is known to the cycle trade of both countries.

**TOLEDO TRADE AFFAIRS**

**New Rolling Mill for the Shelby Tube Makers—Bankrupt Concerns Reviving.**

Toledo, Nov. 14.—The Toledo Machine and Tool Company has finally closed a deal for possession of Yost factory No. 1. Graff Acklin, manager of the plant, says that the lease will run for a year or two, and that the company intends to get the vacant property next the Yost factory.

About a year ago the Shelby Steel Tube Company passed into the hands of the present management, and during that time the business has been so satisfactory that plans are preparing for the erection of a rolling mill in this city. The company finds that the Newcastle rolling mills are not sufficient to meet its demands.

Colonel Terry, receiver for the Maumee Cycle Company, has asked for authority to start business anew. The plant will undoubtedly be operated. Pending the decision, the receiver has stopped the sale of '98 models at the ridiculously low prices at which they have been offered. He is also making arrangements for the operation of the Truman factory, which was taken in charge by the bank last year. He expects to have this factory running within a week or two.

The Union Manufacturing Company will hereafter have its bicycles made by laborers paid by the piece, instead of by the day.

**Rouse-Hazard Property Litigation.**

The Rouse, Hazard & Co. plant in Peoria, Ill., which was sold at sheriff's sale on October 24, to a representative of the Peoria banks for \$5,850, has had a bill in foreclosure issued against it by Joseph Miller & Sons, contractors and builders, who allege that they erected the factory buildings and were obliged to accept a mortgage on the plant in lieu of immediate payment. The suit is against Theodore Miller et al., and the claim is for \$20,000. A petition for involuntary insolvency has also been filed by Excelsior Needle Co., Manufacturers & Merchants Warehouse Co., and M. L. Bennett & Co., creditors of Rouse, Hazard & Co., who allege that the executions and distress warrants issued against the insolvent firm by seven other creditors are issued upon judgments and claims which constitute unlawful preferences under the Torrey bankruptcy law, and notice was given that all persons in whose possession the property now is or may come will be held accountable for the same.

**Stencil Marking on Foreign Shipments.**

A decree has recently been enacted in Chili making the marking of merchandise cases by stencil compulsory, non-observance of the decree making shippers subject to a heavy fine. This is a safe rule to follow in all foreign shipments.

A final settlement has been reached in the matter of the C. H. Seig bicycle factory, and the business is to be placed again in the hands of the original owners. Mr. Seig will continue the management, and a full force will be put to work at the factory.

**AMERICAN PARTS IN ENGLAND****STAMPINGS NOT YET POPULAR**

**Their Introduction Is Found Difficult Because English Tried to Make Them and Failed.**

The use of sheet steel stamping in England is not as general as might have been expected from the changed attitude of makers here, but there are many logical reasons why this should be so, and in another year those who are intimate with the trade predict there will be a boom in American fittings, writes W. S. Mattox in Iron Age. English makers tried to turn out an acceptable quality of sheet steel stampings some years ago, but partially failed and discarded them, going back to malleable castings as more feasible, if more cumbersome and ugly. The process was taken up then in the United States, studied carefully and brought to the perfection it is noted for to-day. American makers did what English makers gave up in disgust—they learned how to make pressed work out of cold rolled sheet steel, and succeeded in turning out an article just as strong and just as light as a malleable casting. But the delicate ethical point of bringing back to England a process originally experimented with here and brought to perfection in America must not be overlooked in accounting for the tardiness with which English dealers have taken up with them.

**More Economical Than Castings.**

It is scarcely necessary to dwell on the manifest superiority of the American fittings. Lugs, brackets, etc., made by the American method can be enameled without further machining. American fittings are practically ready to be assembled into the bicycle when they are bought, whereas the English fittings are still in a crude, unfinished state. The bicycle maker using stampings does not need a costly plant for finishing its parts. By the general use of American fittings cost of labor is reduced and there is an economy of time. All these economical arguments should be palpable, but they are not.

It is true that the price of American bicycle fittings is higher than malleable castings. But the American article is complete, finished, while the work is only just begun when the maker has his castings delivered from the foundry. It is safe to say that if English fittings were bought, finished equal to their rivals, they would cost more than the American product.

The capital tied up in machinery in an English bicycle factory, for finishing castings, is enormous. It takes a man, too, for every machine, the power to run them, and fuel; they occupy valuable space. Here, alone, is an inducement powerful enough in argument, in dollars and cents to prove the superiority of American bicycle fittings. The cost of machinery, skilled labor, space utilized, time lost, power, etc., if converted into capital would have saved more than one firm in the past few months from voluntary winding up.

**Irregular Shipments Hurt Trade.**

One of the serious complaints made against American shippers is irregularity of deliveries, and this has tended to keep down what otherwise might have been by this time a considerable trade in bicycle fittings. English buyers object to the uncertain shipments which have unfortunately characterized our export trade for so long. They have been disappointed so often, buying for delivery in one month and getting their goods six months from date of sale, that they are cautious now. This has been remedied by keeping stocks in England, a costly but necessary proceeding, where a regular business is desired.

### FACTORY COST AND PRICE

The worst enemies of the cycle trade are those members of it who cannot figure or think well enough to distinguish profit in theory from profit in business. There was a time when neither factory cost of bicycles or regular selling expenses or incalculable "overhead" expenses were of vital importance in comparison with the question of increasing the volume of trade. If trade enough could be secured the most sinful extravagance in other respects could be borne. Everybody knows, however, that now another order of things prevails, and everybody is willing to reduce his expenses by all means at his command.

Yet while straining at gnats on the score of expense not a few manufacturers persist in throwing money to the public by selling their goods at prices which leave a theoretical profit but an actual loss. The better they have succeeded in reducing their factory cost and their ordinary selling expenses, the more injury are they capable of inflicting on the trade at large by mistaken calculations on other points. The jobber as a buyer makes it his business to induce mistakes in regard to the real amount of overhead expenses which the manufacturer should guard against. The manufacturer himself is inclined to minimize them in his relations with his banker. The press disregards them in its clamor for cheapness. The superintendent poot-poots them in order to bear out his capability. Salesmen exaggerate their chances for making profitable deals with a minimum of expense and thereby argue against them. The owner must to a certain extent distrust not only all of his employes but also his own optimism and calculations, if he shall avoid delusions, for in spite of everything the overhead expenses will be found in the books and accounts of the firm at the end of the year largely exceeding any allowance that might have been based on calculations.

It is customary among makers who aim to take overhead expenses properly into consideration to add a percentage to factory cost; but it is characteristic of the uncertainty which rules that the addition varies from 10 to 33 per cent. Probably the majority add about 25 per cent to factory cost before they begin to think of profits. Other concerns in which bookkeeping has reached a still higher plane abandon the percentage plan as too crude. It might lead to the production of the various models made in the same factory in wrong numerical proportion, and at the end of the year it might be found that overhead expenses had accumulated much faster in one line of production than in another and that in reality the model which was most pushed was least profitable. They are governed almost entirely by the experience of the previous year and allow no model to be marketed at less than factory cost plus the average expense incurred the previous year for a model of the same class, plus profit; and they assert that any manufacturer who does otherwise should do business strictly with his own capital.

While there does not seem to be any unanimous opinion in regard to the absolute average sum that might be assessed against each bicycle on the score of overhead expenses, it is generally conceded that on a percentage basis the charge should be heavier against the cheaper stock than against high grade machines. With the close margins prevailing for the bulk of production it would be interesting to reach definite conclusions

on this point for the benefit of the manufacturers who contemplate to make their greatest efforts for the coming year in a line of such cheapness as it has not been customary for them to encourage in the past.

The importance of fully appreciating the necessity of estimating overhead expenses correctly is probably greater at this time than it has ever been before, on account of the sharp competition between large and small makers in goods of the same price. It is largely to mistakes made in the allowance for such expenses that the whole downward tendency in prices is due, and it is a deplorable fact that a mistake made by any one representative concern is visited upon the entire trade, representing a loss a hundredfold greater to the industry at large than the erring member could possibly suffer by a mistake in the opposite direction.

### ADVANCED MOTOR VEHICLES

It has been continually asserted that France and England are more advanced in motor vehicle construction than America, and the assertion has militated somewhat against the capitalizing of the industry in this country. The recent motor vehicle contest at Boston will perhaps serve to dispel the modest illusion which has made our general public so singularly self-deprecating in this matter. The contest is likely to be commented upon abroad as of much greater importance than Americans at present would be likely to attach to it, for the one reason that a steam vehicle proved to be better powered for its weight than any of the rivaling gas engine or electric carriages. And when foreign judgment is returned to us our capitalists and our general public may learn to look upon American efforts for solving the motor vehicle problem with a higher degree of confidence than has so far been shown.

The advanced position occupied by France and England, Switzerland and Germany in motor vehicle building has reference more to number of vehicles turned out and in use than to superiority of construction. The manufacturers in France especially have paid much attention to high speeds on level roads, but less to ready operation of the vehicles under difficult conditions. In America the problem has from the start been that of constructing vehicles adapted to cope with wretched road conditions. The good roads in European countries have facilitated the use and production of motor vehicles which would not be considered adequate for any practical purposes in this country. The European industry is advanced, but the European construction is a good roads construction, and is therefore in reality behind the best samples of American work. Being more easily satisfied under the favorable conditions, European thought on motor vehicle subjects is likely to lag, if it is not already fallen behind in the race with Americans. This is in accordance with the old observation that men and nations progress more steadily by being compelled to overcome difficulties.

The barren ground of Scotland has produced the school of agriculturists who became the models for farmers in richer countries. The bad roads of United States are likely to produce the most generally acceptable forms of motor vehicles, destined to become an important article for export to all colonial countries where the requirements are similar to our own.

### THE PAY QUESTION ABROAD

When thoroughly examined and understood, the field of international banking offers exceptional opportunity for the profitable use of large amounts of capital and perhaps it is an encouraging sign for our exporters that interest in this matter of American banks in foreign countries is gradually increasing and that the establishment of international banks is being not only actively discussed but contemplated with serious purpose. The establishment of American banks would be of immense advantage to our trade with those countries and may be indispensable if the United States are not to be distanced in the competition for the markets of the world. The mere acknowledgement of the desirability is hardly sufficient to cause their establishment, however, and in view of the difficulties which must be overcome it remains a question whether the American exporter shall pin his faith to the principle of selling his goods for cash only, making a lowered price the

inducement by which the credit habits of the foreign countries are to be circumvented, or shall lend active aid to the establishment of American discount banks which may conduct his exchange operations and collect his accounts, as done by the English, French and German discount banks in Asia and elsewhere.

The principal obstacle to the opening of foreign banks capitalized in this country lies perhaps in the scarcity of unemployed home capital which might be made available for the purpose. The statistics of the nine months ending September 30 of this year show an increase of 123 million dollars in exports and a decrease of 113 million dollars in imports as compared with the corresponding months of last year, and this enormous increase in productivity representing 236 million dollars worth of goods—of which only a comparatively small sum stands for increase in the value of cereals—calls for probably all the available home capital to provide for the extension of manufacturing facilities. The profits on the trade indicated by the figures are almost insignificant for this purpose, and thus it may be expected that there will continue to be a demand for capital for new enterprises in this country, which will make it exceedingly doubtful if the movement for establishing foreign banks will be successful. The projected enterprises for exploiting trade with the new colonies which it is proposed to acquire, will also tend to make the money market tighter for more distant investments.

\* \* \* \* \*

Only an outsider to the bicycle trade might be deluded into thinking that the lower list prices announced by some bicycle makers for 1899 must have the effect of conquering completely all the world markets in which our supremacy has so far been hotly contested by the German and the British industries. Manufacturers know only too well that the question of list prices for '99 already presents a decidedly muddled prospect and between equal grades, have closer reference to variations in commercial policy than to cost of production. It is cost of production, however, which ultimately decides the course of trade in the world markets. Yet the view has found expression in the trade press that the lower list prices for '99 make a tremendous volume of export trade an assured thing. Undoubtedly a good export trade may be looked for, and it may even be predicted that the number of bicycles sold will round off a larger total figure than ever before reached; for while our exporters are losing somewhat in the northern markets they are at the same time continually expanding their field into those southern countries where bicycles are just beginning to win recognition as an article of necessity rather than luxury. But there is small satisfaction in numbers only, and the supposition that our bicycles will be sold at a reduced price in foreign markets in '99 would leave it extremely problematical whether an increased number of sales would yield a larger profit than more modest sales at a better figure. And there is certainly very little reason for supposing that our manufacturers can produce bicycles at lower cost for '99 than for the past season. The effect of the ever increasing sales of bicycle material turned out by our partsmakers must also be entitled to consideration before any very sanguine hopes may be indulged in by bicycle makers. Some reasons have been assigned in previous issues of this paper for the assumption that our export trade in the coming season will probably be on the whole satisfactory if judicious efforts are made to this end, but it must certainly first be recognized that the close relations between the makers and the public which exist in this country and which make certain sleight-of-hand performances pertaining to the relations between reputation and price, grade and price, and prices of the various grades made by the same manufacturer, more or less efficacious at home, are of small consequence in foreign lands where more rational though less interesting conditions of trade prevail. The great public in those countries will not even hear of any reduction of our list prices in the same sense in which this term is understood among ourselves, but will purchase their bicycles as they purchase their clothes: that is, very largely on the say-so of the dealer. And the latter does not consider it one of his duties to confuse his customers with hazy dissertations on "list prices" or any other commercial distinction of American origin. He has his price and he frequent-

ly shaves it down to an individual customer, but he does not encourage higgling by proclaiming prices and list prices as two different and distinct ideas.

\* \* \* \* \*

No event in cycle sport has had much influence on the course of trade during the past year or two until the continued century riding of Edwards gradually but forcibly compelled the public to abandon most of that prejudice against chainless machines which was based on ill-digested mechanical theories. The practical usefulness of the bevel-gear machine was demonstrated to the satisfaction of most people by that test. The question of price and general convenience and desirability remained and still remains, but the beginning of unprejudiced comparison of merits and demerits was inaugurated. A more sensational test is now booked in favor of another style of chainless machine through Taylor's capture of the world's mile record on a machine fitted with the Sager gear. This performance is, of course, as much to the credit of the rider as to the gear, but its trade importance is nevertheless being fully recognized, because it is the first decisive speed victory of undoubted authenticity which has been gained for the chainless variety of bicycles, and as such it removes whatever antagonism might have been expected from the sportively inclined against a construction from which the chain and sprocket have been eliminated. Nothing short of the mile record or the hour record of the world would probably have sufficed to have accomplished so much, but with these records is bound up a certain justifiable pride, which has not yet lost its significance for trade purposes.

\* \* \* \* \*

When the public first began to suspect that almost any record could be equalled on almost any chain-driven machine if only the right rider were selected, much of that pride in some particular mount, which made people willing to pay a good price for quality, naturally disappeared, and the tendency to hammer prices down became stronger. It might even be asserted that the inclination to ride a bicycle frequently became considerably weakened among a large class of riders when the superiority in speed of one pattern over others became so doubtful that nobody could derive any very lively satisfaction from displaying possession of any particular machine. This speed-pride has not so far supported the trade in chainless machines. Their convenience for general purposes did not appeal in the same manner to a sentiment which is widespread and powerful among young men. Misgivings in regard to speed were apparently sufficient to neutralize all mere regard for comfort or elegance. By Taylor's performance it seems as if the element of pride in one's mount may be reintroduced to some extent, and it would not be very wonderful if a succession of racing matches between bicycles of different types of construction would be the most immediate result. By arranging such matches on the plan of Boston Whist so as to remove the question of the personal superiority of the riders as much as possible, an intelligent race promoter could perhaps succeed in arousing sufficient public interest to make a venture of this description profitable to himself and inexpensive to the trade.

\* \* \* \* \*

Business sermons should be brief. An Illinois firm uses a letter head which is a lecture condensed. On the side of the firm name three National banks are cited as references and below is the legend: "Our only terms are cash." On the other side one reads: "Our catalogue is our contract; read it carefully," and "We sell to dealers only." It happened that the letter over which this head was noticed contained the clause: "We are still doing business at the old stand are are beginning our 43d year. The Texas store is simply a branch." The long continued success capped with the establishment of a branch lends terse eloquence to the mottos that indicate the means by which the success was accomplished.

## TRADE MARK REGISTRATION

### Documents Required for Registration of Trade Marks in Principal European Countries

The procedure necessary for the registration of trade marks in foreign countries, while not varying greatly in any very important particular, is not so similar as to lead to the conclusion that one form of practice will serve all purposes. In the Sept. 15 issue of Cycle Age the cost of such registration in all of the principal European countries was set forth, and it is now only left to present what was at that time omitted, namely, the documents required and the term for which registration may be secured.

#### Requirements in Germany.

1. Power of attorney, signed by the applicant.
  2. A certified copy of the certificate of the registration of the trade mark in the country in which applicant resides, legalized by a German consul.
  3. Five facsimiles of the trade mark. The facsimiles must not measure more than 6.5 centimeters (2 5/8 inches) in height or width.
  4. A wood-cut or electrotype of the same dimensions as the facsimiles.
- Term—Ten years, with renewals indefinitely each ten years.

#### Austria-Hungary.

1. A power of attorney legalized by an Austrian consul.
  2. An official certified copy (if this cannot be secured one made by a notary public will be accepted) of the certificate of registration of the country where the petitioner resides, showing that the trade mark is protected there. This must be legalized by the Austrian consul.
  3. Two wood-cuts or electrotypes of the mark.
  4. Twelve copies of the mark.
- Term—Ten years, with renewals every ten years.

#### Belgium.

1. A power of attorney, signed by applicant, not legalized.
  2. One wood block or electrotype, which must not exceed 3 1/8 inches by 4 1/8 inches in size.
  3. Three copies of the mark.
  4. A description of the mark and the manner of its employment.
  5. The full name and address of the applicant.
- Term—Unlimited.

#### Denmark.

1. Full name and address of the proprietor of the trade mark.
  2. A description of the mark and of the manner it is employed.
  3. Four copies of the mark, not exceeding 15 centimeters (5 1/8 inches) in length and 10 centimeters (4 inches) in width.
  4. A certified copy of the registration in the country where the applicant resides, showing that the trade mark is registered and the sole property of the petitioner in that country. The certificate must be legalized by a Danish consul.
  5. A power of attorney, signed by the applicant, and legalized by a Danish consul, which must contain a declaration to the effect that the applicant will submit to the decisions of the maritime and commercial tribunal of Copenhagen in all questions relating to the trade mark.
  6. Two wood-cuts or electrotypes of the same size as the copies furnished.
- Term—Ten years, with renewals indefinitely every ten years.

#### France.

1. Power of attorney, signed by the applicant, and legalized by a French consul.
  2. Three copies of the trade mark.
  3. A description of the goods for which the mark is used and of the manner of employing it.
- Term—Fifteen years, with a renewal for fifteen years more.

#### Great Britain.

1. The full name, address and occupation of applicant.
2. Four exact copies of the trade mark.
3. A wood-cut or electrotype of the mark.
4. A statement of the goods or articles with which the mark is used.
5. A statement as to how long the mark has been used in connection with the goods mentioned.

Term—Fourteen years, with renewals indefinitely every fourteen years.

#### Holland (Netherlands).

1. A power of attorney, legalized by a consul of the Netherlands.
  2. Four copies of the mark.
  3. One wood-cut or electrotype.
  4. A certified copy of the certificate of registration of the country where the applicant resides, showing that the mark is registered there and is the property of the applicant.
- Term—Fifteen years, with renewals indefinitely each ten years thereafter.

#### Italy.

1. Power of attorney, signed by the applicant, and legalized by an Italian consul.
  2. A certified copy of the certificate of registration of the country where the applicant resides, legalized by an Italian consul, showing that the trade mark is registered, and the sole property of the petitioner in that country.
  3. Four copies of the trade mark.
- Term—Unlimited.

#### Norway.

1. Full name and address of the proprietor of the trade mark.
  2. A description of the mark, its colors, and the articles for which it is used, and the manner of employing it.
  3. Two wood-cuts or electrotypes of the mark, not to be more than 10 centimeters (4 inches) wide by 15 centimeters (5 1/8 inches) long.
  4. Four copies of the mark, of the same size as the electrotype.
  5. A certified copy of the certificate of registration in the country where the applicant resides, showing that the trade mark is registered in his native country, and is the sole property of the petitioner. This certificate must be attested to by a Norwegian consul.
  6. A power of attorney, signed by the applicant, and legalized by a Norwegian consul.
- Term—Ten years, with renewals indefinitely every ten years.

#### Russia.

1. A power of attorney, signed by the applicant, and legalized by a Russian consul.
  2. A certified copy of the certificate of registration of the country where the applicant resides, showing that the trade mark is registered in that country, and the sole property of the petitioner. This certificate must be attested by a Russian consul.
  3. Five copies of the trade mark.
- Term—Unlimited.

#### Sweden.

1. Full name and address of the proprietor of the trade mark.
  2. A full description of the trade mark, and of the articles for which it is used, and the manner of employing it.
  3. Two wood-cuts or electrotypes of the trade mark, not exceeding 15 centimeters (5 1/8 inches) in length by 10 centimeters (4 inches) in width.
  4. Four copies of the trade mark, of the same size as the wood-cut or electrotype.
  5. A certified copy of the certificate of registration in the country where the applicant resides, showing that the trade mark is registered in that country, and is the sole property of the petitioner. This certificate must be legalized by a Swedish consul.
  6. A power of attorney, signed by the applicant.
- Term—Fifteen years, with renewals limited only by term of applicant's protection in his own country.

### PRICES OF CANADIAN IMPORTS

#### Receipt of Bicycles from United States More Than Doubled Yearly Until 1897—Invoice Reduction.

Speaking of the extension of trade relations between Canada and the United States, Consul Linsley, of Coaticook, in his annual report, says the best way is to work through the large establishments in Montreal and Toronto, or to establish branches in large cities to directly cover the territory. While the tariff, he says, prevents the importation of numerous classes of merchandise, there are many which, on account of their merit, will

nevertheless be sold. The bicycle trade is an example of what enterprise in a single line will accomplish. In 1894 the United States shipped 2,805 machines, valued at \$126,550, to Canada. In 1895 the number had risen to 7,514, at a value of \$332,933; in 1896 to 15,543 at a value of \$685,427, and in 1897 to 23,601 machines valued at \$758,783. During the fiscal year of 1898 our exports of bicycles were valued at \$614,003. A statement issued by the customs department of Canada shows that during the month of July, 1897, the imports of bicycles and parts of same from the United States were valued at \$35,872, on which duty was collected to the amount of \$10,708.10. The imports in the same lines during the same month of the present year were valued at \$40,639, on which a duty of \$12,185.91 was collected.

The figures given borrow additional interest by supplying not only values but also quantity of bicycles sold. It will be seen that the average invoice price upon which duty was collected remained in the neighborhood of \$45 per machine during the years 1894, 1895 and 1896, but fell to \$32.50 in 1897.

### FARMERS' BUYING CAPACITY

#### Vast Increase in Exports of Farm Produce Indicate That Country Trade Will Be Large.

The farmers of the United States will receive during 1898 more money from abroad for their products than in any preceding year. A statement regarding the exports of principal agricultural products, just issued by the Treasury Bureau of Statistics, shows that in the item of breadstuffs alone the exports for the 10 months ending October 31, 1898, amounted to \$250,237,455, which is \$65,000,000 greater than in the corresponding months of last year and \$38,000,000 in excess of the exceptional year 1892. Provision exports also show a good record, being for the 10 months of 1898, \$162,830,643, against \$146,607,039 in the corresponding months of last year and \$125,508,568 in 1892. Cotton exports for the 10 months are \$13,000,000 in excess of last year and the number of pounds is larger than in any corresponding period in the history of the country.

The exportation of practically all classes of farm products has increased. In wheat, corn, rye, oats, oatmeal, cotton, bacon, hams, lard, oleomargarine, fresh beef and many other articles of farm production, the exportations of the ten months are not only in excess of those of the corresponding months of last year, but larger than in any previous year.

The following table shows the exports of breadstuffs, provisions and cotton in the ten months just ended, compared with the corresponding ten months of the three preceding years:

Ten months ending October 31.	Breadstuffs, Million Dollars.	Provisions, Million Dollars.	Cotton, Million Lbs.
1895	98	126	2,082
1896	136	135	1,956
1897	185	147	2,023
1898	250	163	2,670

#### Raymond to Sell Palmer Tires.

Howard E. Raymond has accepted the responsible position of sales manager for the tires manufactured by the B. F. Goodrich Co. Mr. Raymond's rare talent will be exercised chiefly in extending the popularity of the Palmer tires. Next week he will move from Chicago to Akron.

City Treasurer Torrence of Pittsburg, Pa., reports that 15,000 bicycle licenses were issued during the spring and summer of this year, which exceeds by more than 1,000 the number issued in 1897.

## ASSEMBLING MISFIT PARTS

### Unmatched Set Fittings Common—Jobbers and Assemblers Ignore Rules for Frame Design

The remark was recently made in a discussion regarding the propriety of cycle building in repair shops, that if each small builder would buy all of his parts at one supply house he would have better success in turning out good frames, and that there would be fewer badlooking joints. Buying of one firm does not, however, let a poor cycle maker into the ranks of high class builders.

The small builder generally buys his stock from jobbers, that is, from supply houses which handle fittings for the small wholesale trade, but which do not make these fittings. The large firms which make their own fittings sell to the large makers or to jobbers of supplies. Hence the small builder buys of concerns which as a general rule have no very candescent luminary on mechanics connected with them, the management being for the most part confined to the commercial end of the business. It is accordingly not rare to find sets of parts catalogued and sold which do not fit with the nicety indicated by the blue print diagrams. The average small builder being a man who has no real insight into the matter of laying out frame lines and who could not draw a set of frame lines under any circumstances, but who has merely the practical knowledge of fitting frame parts together after some fashion hardly to be called intelligent, pinning the lugs, brazing the joints and filing off the superfluous spelter; it cannot be supposed that he can adapt badly matched fittings in such a manner that a first class frame will be the result. The good builder who understands thoroughly the relations of frame parts to each other and the various frame proportions in the different shaped frames, can take fittings which do not match perfectly, and by little changes in specified tube lengths, etc., erect a first class frame. The many queer shaped frames and queer looking angles seen on repair shop bicycles stand in evidence that the average builder is not equal to the task of correcting evils arising from the poor combination of fittings furnished him by the supply firms.

#### Brackets Known by "Drop" Alone.

An example of the carelessness displayed with regard to the accurate fitting of parts is the crank brackets sold. Nearly every supply house in Chicago sells a certain hanger and nearly every repair shop builder buys it. It is a common thing to notice a builder come into a store and ask for one of these hangers, naming certain specifications, and to hear the salesman ask him if he wants the bracket for a three, or for a two and a half inch drop. These brackets when sold at supply houses are made for three and for two and a half inch drop and are sold to match all of the fittings in the city. But few repairmen ever stop to think that the same bracket may give a three inch drop in one frame and a two and a half inch drop in another, and just how it gives a three inch drop in the frames they are building they do not know. The repairman takes his hanger for the three inch drop, goes back to his shop, cuts up some tube, tries the parts together, pinches one angle, pulls another, cuts off the top rail a little, pulls the lower rail nearly out of the sockets, pins the thing together, brazes it, files the joints, sends it over to an enameler's, puts on the other parts and wheels when it comes

back, and sends it out of the shop, a bicycle with an approximate three inch drop and an up-to-date appearance of the kind to which distance lends enchantment.

One reason why so many parts fail to fit together properly is because supply houses often buy of different makers. A house may buy its hangers here, its seat clusters there, its head lugs somewhere else. It may furnish either separate head lugs or one piece heads. The one piece heads are made at some stamping plant, the separate lugs may be made at another stamping plant or at some mitis casting foundry. The one piece head sold by one firm as matching its frame parts is also sold at other houses to match other sets of parts. Such a condition would not be as bad as it is if every builder knew how to adapt what he can get, but nearly every repair shop builder only knows how to assemble in the easiest manner what is supplied him as matching parts.

#### Blue Prints Often Misleading.

A certain line of juvenile fittings made from castings do not match the original drawings, or at least those blue prints which are supplied to patrons. A builder who bought a set of these parts cut his frame tubes as per the blue print figures, but when he attempted to put the frame together he found that it was impossible to make the parts connect. After much tampering with tube lengths and springing of joints the frame was assembled and brazed. After completion it looked no more like the frame in the drawing than if it had been made from an entirely different set of fittings. The head was longer, as was also the wheel base, and when the front forks and wheels were put in it was found that the front angle to the crank hanger was so much larger than it should have been that the top frame tube would not be level, but was raised at the front end.

Another company formerly sent out frame sets in which the bent rear forks were not cranked enough to allow for clearance of the cranks. The common method for the correcting of this evil was the bending of the cranks, though it is known that some builders went to the trouble of rebending the forks. Fork stems, threaded and sold as being cut to lengths for certain height frames built from the seller's parts have very often been found to be either too long or too short. More than one firm has been guilty of such small mistakes as this. The safest plan in buying fork stems of any firm is to get one long enough for any frame and to then cut it off to suit. The trouble with the latter plan is that there are many builders who have not enough mathematical ability to figure out how long they really do want their fork stems. They have to try and, if not right, try again.

#### Sprung Rear Stays—Faulty Catalogues.

The same story is told by nearly every repairman who has used during the closing season the seat cluster marketed by a certain other firm dealing in supplies. It is stated that the angle at which the rear stay lugs are set to the main lugs is so small that were the stays placed on the lugs without springing, they would strike the rear forks somewhere from three to six inches in front of the rear end lugs,

according to the length of the rear frame. This one lug belonging to a popular line of fittings is responsible for a very large part of the bad looking seat clusters to be seen on '98 repair shop bicycles in Chicago. The changing of the angle, by sawing each stay lug nearly in two from the under side, opening each up at the sawed place, filling up with scraps of metal and brazing together again, was recently the subject of an article in a well known machine paper. Even the repairmen who buy the most expensive parts are sometimes put to trouble because the supply house which markets them has not marked the angles of the lugs on the diagrams in the catalogue. If a builder wants to know what the angle of a lug is, he must either send to the office to find out or must rely upon the not always accurate plan of measuring one of the lugs itself.

#### Few Adjustable Rear Fork Lugs.

In Chicago rear end lugs are bought by everyone without regard to angle and are used as they are if they can be made to go, and if not the builder changes the angle as best he may. It is not difficult to change the angle of a rear lug of the common flat stamped pattern, but it takes a rather good workman to change the angle of a heavy cast rear lug, which in nine times out of ten is liable to have a very light connecting body between the branches, thus increasing the liability of breakage. One supply house for a time handled a line of stamped fittings, which were sold in sets, and the buyer was furnished with tube cut to length or with directions and figures for cutting the tubing. A repairer after having tried to build frames from these sets and having found that the frame dimensions as per the supply house's drawings and specifications were far from right, went around and, after complaining, was requested to furnish the company with the correct tube lengths for the frames.

The above instances of careless specification of parts and the differences between specifications and parts themselves carry a lesson for the retail bicycle trade as well as for the parts trade. It being so hard to get parts which fit correctly, and the variety of parts sold by each house under the assumption that any combination will work well together makes it apparent that a well made bicycle is out of the question in a repair shop whose proprietor does not have intelligent ideas on bicycle design and can not do for himself that which the parts firm has failed to do for him.

#### Trade With South Africa.

The remarkable development of trade between South Africa and the United States is indicated by the shipping statistics, which show an increase in the last two years of at least 50 per cent in the shipments of the various articles of commerce that South African merchants order from American manufacturers, and it can be safely predicted that, at the end of the current year, there will be a still more marked increase in such traffic. A line of steamers running at regular intervals is now connecting the two countries, and they are packed with goods as they arrive from month to month. A glance at the shipping freight rates shows the great advantage American exporters have over those in England and Germany. The freight from the United States to Cape Town is: First class, fine goods, \$8.50 per ton; second class, fine goods, \$6; third class, rough goods, \$5.46; fourth class, rough goods, \$4.25. The rates from class, \$12.15; second class, \$9.72; third class, \$9.11; fourth class, \$8.50. The freight from England is: First class, \$13.36; second class, \$10.12; third class, \$8.50; and fourth class, \$7.78.

## REPAIR SHOP ECONOMICS

### Case Hardening in Small Lots—Methods Suggested for Use in the Shop

The working of high carbon steel is a slow process on any lathe and with the best of men in charge. Mild steel, however, works very readily and even the small repairer with the foot power lathe can turn it up into cups, cones, pedal pins, etc., without much difficulty. But having turned it up he is confronted with the problem of hardening it. Having turned up tool steel it becomes but a matter of heating and plunging the piece into cold water or oil to temper it. While this operation is not so simple as it appears and while it takes long experience to temper properly, yet after some practice the repairer will be able to temper after a fashion. But could he case harden he would not have to run the risk of poor tempering, would be saved the work of turning hard steel and the expense of purchasing high priced steel stock.

#### Hardening by Cyanide Process.

Case hardening has in the last few years become more widely and better understood and the methods employed have been much improved. Still the small shopman has been practically left out of the question. The modern case hardening methods are mainly methods for the large case hardener who can establish a plant for doing the work on an extensive scale. The occasional hardener and he who desires to harden in small lots is still in about the same situation that he occupied several years ago as far as general knowledge on the subject is concerned. The commonly accepted opinion is that to the small shopman there are two courses open. He may either send his pieces to some regular case hardener or he may adopt the original plan of case hardening in cyanide of potassium. The former plan is open to only the repairer in the large cities. The country repairman cannot afford the time necessary to send parts to the nearest large city to have them case hardened. The expense would be such that it would be as economical for him to make the parts of tool steel in the first place, or even to send to the factory, where the original part was made and get a duplicate. If he case hardens he must do it himself. The cyanide process is satisfactory in that it is simple, and one man may with a little experience do it as well as another. But done as well as may be it still is only a makeshift case hardening as the shell of hardened steel on the piece is so thin that it will give but little service. The operations in case hardening by the cyanide process are few. The piece to be hardened is heated to a bright red and then held in the cyanide of potassium for a few seconds. The part is then plunged into the water or oil for hardening. There is one advantage of this process which recommends it to the bicycle repairer. The hardened shell being so thin grinding is out of the question. This relieves the repairer of the conscientious responsibility of grinding the piece. Further, it is hardly necessary to grind a cone or cup hardened in this way, even if it could be done. A tool steel cone may be ever so accurately turned up, but when it is tempered it will be found to have warped out of shape, and grinding made necessary if the cone is to have the proper shape and size for good running qualities in the bearing. Very few repairers out of the several thousand in the country have facilities for grinding. The cyanide case

hardening does not to any perceptible extent warp the cone or cup out of shape.

It may or it may not be possible for the repairer and the small shopman in other lines to case harden by similar processes to those employed on a large scale. A summary of the case hardening processes as they exist will enable the repairer to grasp the situation and discover for himself whether it is possible for him to utilize on a small scale the processes which are practical, profitable and desirable on a large scale.

#### Furnace Hardening With Bone Meal.

Case hardening by the usual methods necessitates a furnace in which to heat the parts, some substance to bake with the pieces in order to lend them the desired carbon, and something, either oil or water, into which to dump the parts in order to harden them. It is the first requirement that is the stumbling block to the small hardener. Any material rich in carbon which when heated will be assimilated by the steel may be used for carbonizing. Scraps of leather, hoofs, bone meal, charcoal, etc., are all used, bone meal, or bone meal mixed with charcoal being the most common and the most generally satisfactory. It may be pur-

chased of firms who make a specialty of such products or it may be bought from stock yards concerns and other large meat houses which waste nothing in the butchering and marketing of cattle and which place for sale in some shape or other everything that can be saved in the butchering of their stock. For ordinary purposes bone meal is doubtless the best substance to use. It should be purchased in a grade which has a coarse granulated appearance, the particles being about the size of rice. The parts to be hardened are placed in a cast iron pot or box together with the raw bone. The box may be of any convenient form, and for such parts as cups and cones it may be about six inches deep, six wide, and eight or ten inches long. A layer of the bone meal about an inch thick is spread over the bottom of the box and then a layer of cones put in, care being taken that the cones do not touch each other. It is well to leave about an inch of space between all adjoining cones. Then sprinkle on more bone to fill up between the cones and cover them with a layer which shall also be nearly an inch thick. Repeat the operation till the box is filled with successive layers of bone meal and parts. The cover may then be put on and the box placed in the oven or furnace, where it is left under a steady medium heat for from four to eight hours, according to the character of the parts, and the depth of the shell desired. Nothing but experience can determine just how hot to heat the pieces and just how long to leave them in to obtain the best results. After the box containing the parts has been

heated sufficiently and the parts have absorbed carbon enough from raw bone to insure a hardened shell of the desired thickness, the pot is removed from the oven and the parts dumped into the water or oil.

While constant work at hardening will teach one how to judge of the proper time for the removal of the parts for dumping, and while the experienced case hardener scorns anything in the line of mechanical aids to tell him when his work has been heated sufficiently, there are many who have not reached that point of self-confidence where they can repudiate things which will help them to do their work properly. For such it is well to know the simple trick of using the tell-tale. The tell-tale consists of a piece of round iron of nearly the same diameter as the pieces to be case hardened. A hole is made in the center of the cover of the heating box just large enough to receive the tell-tale snugly but not tightly. The iron rod should project above the top of the box to allow it to be grasped with a pair of tongs. Below the cover the rod extends well down into the bone meal. The arrangement of the tell-tale with regard to the box, cover and pieces to be hardened is shown in Fig. 1, in which A is the cover and B the tell-tale. When the box with its contents has been heated for a time that seems sufficient to the operator, the oven door may be opened and the tell-tale carefully withdrawn from the box with a pair of tongs. The contents of the box must not be disturbed during the operation. The rod is plunged into cold water and if upon inspection and after breaking and after trying with a file the rod appears to be hardened sufficiently the pot is taken out and its contents dumped. If the tell-tale is not hard enough or if the shell is not thick enough the box is left in the oven for a longer time. To make the matter more certain, two, or even more tell-tales may be arranged in each box, thus avoiding uncertainty after the first rod has been removed. It is a good plan before dumping the parts into the water or oil, to cool them off and then heat evenly to a tempering heat and then dump. This obviates the probability of dumping the parts at a temperature too high for good hardening. In reheating to a tempering heat the case hardening when obtained will be even and fine grained.

#### Recourse to Banked Boiler Fires.

The question now arises in the repairer's mind: "What chances are there for me to have a furnace in which to heat parts to be case-hardened?" It may be taken for granted that the small case hardener will need but a very small pot in which to heat his parts, and that he will have use for but one box at a time; otherwise he would not be a small hardener. Hence the oven in which the repairer heats his parts may be very small. The main point is that of some means for maintaining an even heat for a time of from four to six hours. The pot may be any iron box which the repairer can get or can make. The easiest way for the repairer to provide himself with a furnace is by making arrangements with the night fireman of some plant having a steam boiler. After the fires of such a plant have been banked for the night the hardening pot may be set in the boiler firebox on the coals and instructions left with the fireman to take it out at a certain time, four or five hours after, and dump the contents. In this way the parts may be hardened without any expense except that of the raw bone, which for case hardening on a small scale, does not amount to much. If there is no night fireman to watch the banked fires the box may be put in late at night and left to be dumped by the repairer himself early in the morning. Case hardening at night

TRADE MARK

# We Have Authorized

the Olds Wagon Works, of Fort Wayne, Ind., to manufacture Dunlop Laminated Wood Rims and use our trade mark on same. The trade is referred direct to them for quotations. They have not at present any stock of rims on hand, but will proceed with their manufacture at once.

## The List of Authorized Wood Rim Makers Now Stands as Follows:

- Fairbanks-Boston Rim Co., Bradford, Pa. and Bedford, Mass.
- Kundtz Bending Co., Cleveland, Ohio.
- Olds Wagon Works, Fort Wayne, Ind.

## The American Dunlop Tire Co.

134 Lake Street, Chicago, Ill.

Belleville, (North Newark) N. J.

TRADE MARK

Mention The Cycle Age

“They are after you, Mr. Bicycle Manufacturer.”

WHO ?

Our Travelers!

They are *looking for all manufacturers who are looking for the best* in our line. We *don't make cheap tubing* for use in cycle construction and *don't believe* any bicycle manufacturer who makes a *good wheel* and *stands behind* it will consider seriously the use of *interior tubing* for one minute.

# “SHELBY”

is made from the *highest grade Swedish Charcoal Steel* that can be obtained. “SHELBY” has the *capacity and equipment* to meet *all demands*. “SHELBY” has the reputation of *making tubing* of the *highest standard*. Catalogues and further information on application to our offices.

BIRMINGHAM, ENG.

Mention The Cycle Age

in this manner enables a repairer to turn out a cone or cup in the afternoon and have it ready for delivery to the customer on the following morning.

If it is not possible to get the use of a boiler firebox, the repairer must rig up some sort of furnace himself. If he has a forge or the use of one an oven of fire brick may be built on the bed of the forge and the heating pot set inside on the forge coals. In such a manner the best of results may be obtained as the operator may watch the work constantly and if desired, use the tell-tale to help him, but like most good things, it has its drawbacks, these being that somebody must work for about four hours fanning the flame of the forge gently in order to keep up the even heat required. Of course, if access to some factory forge which is fitted with a power blast is had, case hardening on the forge becomes a fairly easy manner, the chief point then being to erect an oven which will be tight enough to maintain an even heat.

#### Scheme for Using Gasoline Brazier.

The remaining practical course that is open for the repairer's trial is case hardening on the gasoline brazier. In Fig. 2 is shown a scheme for rigging up a case hardening oven on a common form of gasoline brazier. It is doubtless worth trying as the expense will be but slight. A table of fire brick in one piece is placed on the brazier head and four walls, each consisting of a single piece of fire brick set up on the bed. One of these

sides should be so fitted and arranged that it can be easily removed. A piece of brick similar to the bed should be laid on top of the walls thus completely enclosing the bed of the brazier and forming an oven. In two of the side walls holes should be provided for the passage of the flames from the burners, or for the burners themselves if they are of such construction that they extend inward toward the center of the bed. A shelf (A) of iron rods is placed above the flame and on this may be set the box or pot in which the part or parts to be hardened are contained. This oven being small will take but comparatively little heat to get its interior up to the proper temperature and if the fire bricks be two or three inches thick and closely set, they will prevent the escape of very much heat. The pieces may be placed in the pot with the raw bone and the pot placed on the shelf and the removable side to the oven placed in position. The brazier may be then started and kept at a slow heat till the parts are ready for removal. The supply of air and gasoline being both under perfect control the flame can be readily maintained at a constant heat. If necessary, the supply of air in the tank can be renewed from time to time without affecting the blast at the burners. The gasoline burned during the four or five hours will not amount to enough to make the process an expensive one. It is not known whether this scheme has even been put into practical operation, but it seems to offer a way for the repairer to do his own case hardening and accordingly is among the possibilities in this line.

## WINTER CARE OF SIDELINES

### KEEPING STOCK IN CONDITION

#### Metal, Leather and Wooden Goods Seriously Affected by Shelf Position—Moisture From the Floor.

Next in importance to the advantageous display of sidelines, is the care of the stock comprising the same. It is of little use that such goods are free from rust, soiling and marks of general abuse if, on approaching the sale, the stock is in such poor condition, from lack of attention or neglect, as to cause a refusal to accept them; or, if taken, dissatisfaction with the purchase results. In carrying on a business involving many different materials and combinations of articles variously affected by changes of weather and other unavoidable influences, it is of the first importance that the stock should be located within the store, not at hap-hazard, or wherever a vacant place is handy, but made the subject of very careful attention.

#### Middle Shelves Safest.

Because it forms the basis for the larger part of many fancy goods in the shape of leather wares, wood work is the first item to take into consideration. Wood, even after years of seasoning, is more or less adversely affected by extremes of either heat or cold. As the stock of fancy wares is largest during the few weeks immediately preceding the holidays, it is well to bear in mind that the fires which have already been started, warm the rooms and buildings with a different quality of heat from that of summer. The former is dry and sudden, and, obeying the natural laws of heat, ascends to the upper parts of the room. Obviously, the upper shelves should not be reserved for goods subject to warping. Equally bad is the lowest, or floor shelves or bins. The sprinkling of the floor in sweeping, the current of cold atmosphere resulting from the opening and closing of the doors in bad weather, and the snow and wet brought in on the shoes, umbrellas and garments of customers, keep the floor during the winter season in a state of continual dampness, as detrimental to wood work as excessively dry heat. A medium place, between the upper and lower shelves, will be found not only better, but actually imperative, for keeping many classes of sidelines as they should be.

Leather, when kept in a damp place, is subject to a greenish mould that destroys the wear of the leather. Too much heat dries and cracks it. A medium shelf for this part of the stock will be found to be the best. Cutlery, so hard to keep long in stock without liability to rust, can be put on the upper shelves, as the dry heat, so detrimental to other stock, is the surest safeguard against rust and consequent loss. The various textile goods liable to be in the stock of sidelines of the cycle dealer, are not ordinarily affected by either heat or cold, and may be kept as convenience of space suggests.

#### Avoid Prepared Metal Polishes.

In cleaning nickel, brass, and other polished metals, the thousand and one so called "polishes" should be very carefully avoided. The chemicals of which many of these are largely composed, are acids more or less diluted; and, though apparently effective, will be found in the long run to injure and deface the articles to which they are applied. Jewelers' rouge and alcohol freely applied with a chamois skin, and polished afterwards with dry chamois, will be found the best, cheapest and most satisfactory method of restoring dimmed and lusterless metals. The many minor matters as to stock are too well known to require mention in

this connection; but it should be remembered that with a furnace fire, running the temperature up perhaps to 80 or 90 degrees, care must be taken with some classes of sidelines, or warped and damaged goods will follow as surely as old damaged stock means loss, and well kept, clean good stock, means success.

## BALL NESTING MACHINE

### Kendig Designs Machine for Placing Balls in Hubs and Pedals—Saves Much Time.

Mr. Kendig, foreman of the stock-room of Black Mfg. Co., Erie, Pa., has designed a machine for filling balls into cups of hubs or hangers, etc., by means of which time and labor may be saved. In the old manner of putting the balls in by hand, which necessitated the balls being counted, a man could do 160 pairs of hubs a day and feel that he had done a day's work. By the Kendig machine a novice can fill 140 an hour, the machine counting the balls and allowing just so many to pass each time the lever is pressed. The drawings give a general view of the machine attached to a wall and sectional plan and elevation, and also show the valve or gauge by which the balls are allowed to pass into the nozzle ready for the operator to open the lever. It will be seen that there are two levers, one allowing eleven balls to pass, while the other

allows thirteen. This is for parts such as pedals, where a larger number of balls is used on one side than on the other.

The machine is composed of a box at the top of the support, with a V-shaped bottom in which the balls are stored. Running from this box is a hose the inside diameter of which is the same as that of the balls to be used. At the end of the hose is the valve, the end of which reaches just to the end of the hub when in place. Running from the box to the floor is a foot lever, attached at its upper end to a rod which lies on the box and has a hollow front portion slightly larger in the hollow than the diameter of the balls. This lever, by being pressed with the foot, pushes the hollow rod toward the mouth of the hose, where it enters the ball box. This movement keeps the hose filled with balls, and at the same time does not allow them to clog at the entrance of the hose. The hole in the rod "runs out" about half way of its length so that if the hose becomes full of balls and the lever is pressed, the balls will not be forced into the hose, but will pass out of the hole in the center of the rod or tube. The hollow rod or tube is merely provided for a feed for the hose, as without something of this nature, the balls would clog in front of the hose.

Three international bicycle exhibitions will be held in Belgium during the coming winter, as follows: Antwerp, opening February 1; Liege, March 10, and Brussels, March 20.

# Fauber 1899 Hanger.

NEW IDEAS—NEW PRICES.

**MANUFACTURERS** who used Fauber Hangers were very successful and well satisfied.

**DEALERS** found them good sellers and bicycles fitted with them not dead stock.

**RIDERS** appreciate the simple and practical construction of the Fauber Hanger and the advantage of a standard article for which you can get any necessary repairs.

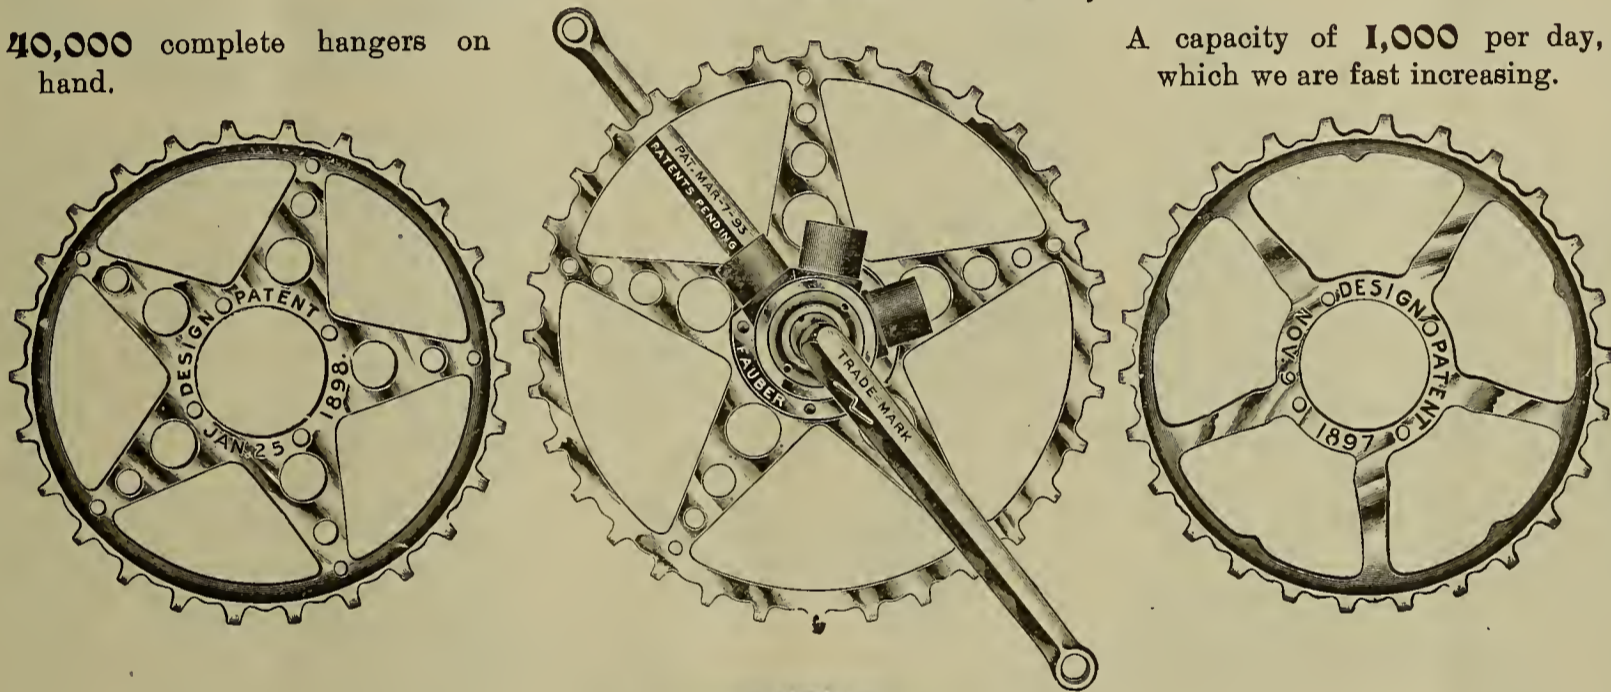

We are **Pioneers** in the manufacture of **One-Piece Crank-Axles** and own more than twenty allowed and pending patents. The **Success** of the Fauber Hanger is unparalleled in the bicycle trade.

## OUR RECORD.

1895	Output over	200
1896	"	9 000
1897	"	30 000
1898	"	100 000
1899	Output estimated	300,000

40,000 complete hangers on hand.

A capacity of 1,000 per day, which we are fast increasing.

Our improved Spanner Lock Nut makes Note this is our

the end of the hanger flush and dust-proof. special construction.

## IMPROVED FAUBER REAR FORKS AND BACK STAYS.

FORK COMPLETE.

PIECES SEPARATE.

**THE COMING CONSTRUCTION**—These forks are made of three pieces ; the neck tube is slotted ; the ends overlap in the joint, making it flush and reinforcing the bend. We furnish the forks ready to assemble. They line up, are easily brazed, finished, strong and light. The shape and style of this fork are perfect. To supply a part of our trade for '99 we have contracted for 500,000 feet of Shelby Tube.

## RECENT PATENTS

### Adjustable Wire Toe-Clips—Eccentric Driving Chainless— Paper Rim of Unique Form

**Ashworth's Toe-Clip.**—The drawings show three forms of wire bending by which it has been the inventor's object to produce an adjustable toe clip from a single piece of wire, capable of being quickly applied to and removed from a pedal. The adjustment is partly automatic through the springy action of the loops on top of the clip, and partly rigid and

is effected by springing the lower loops more or less apart when attaching them to the pedal plate. The latter adjustment presupposes oblong slots in the pedal plates, giving a certain lateral range within which the small fastening plates may be bolted. In one of the patterns shown the wire is protected from wear by a sheet metal plate bent to clasp the lower wire loop and provided with a vertical slot for central attachment to the pedal plate. The patentee is A. W. Ashworth of St. Cloud, Minn., assignor to Rand E. Ashworth of the same place. The patent is number 613,957, of November 8.

**Annable's Chainless.**—The driving rods are actuated by eccentric disks secured to the crank shaft, with ball bearings between the disks and the circular straps of

the rods. In clips taking the place of the usual fork end fittings are ball races in which the hub may rotate and one of the clips has an outwardly extending flange to the periphery of which is attached an internal gear. Internally of the hub there are ball races in which the axle rotates. The axle is provided with disks at both

ends, one of the disks being adjustable. To each of these disks are attached crank pins journaled in ball-bearings in the driving rods. To the disk on the gear side of the mechanism are two studs, on which are journaled planet gears which engage the fixed internal gear and a pinion on the hub. Thus the axle is rotated through the driving rods on both sides, set quartering, and the motion is transmitted to the hub by gearing one side only. As usually in mechanisms of this kind, the requirement of rigidity and perfect accuracy and correctness of gear cutting is paramount for the easy running of this device. The stresses on the ball bearings in the hub must be considerable. The inventor is Warren W. Annable of Grand Rapids, Mich., assignor of one-half to G. S. Johnson of the same place.

**Clapp's Brake.**—The brake is applied by the first backward movement of the pedals, and may then be held in action by holding the pedal in stationary position, and the brake may be applied with greater or less force, according to the

pressure on the pedal. The hub has a cam-ring of hardened steel, secured by a pin on the hub entering a recess in the ring, and the driving sprocket surrounds this cam-ring, balls being interposed. This permits a backward rotation of the sprocket-ring without moving the hub; but when the sprocket-ring is driven forward the balls pinch between the inside of the ring and the inclined faces of the teeth on the cam-ring and cause the clutch-wheel and hub to rotate with the sprocket-ring. Around a cylindrical extension of the hub is a wearing-ring. A spline projecting from the hub causes this ring to partake of any rotary movement of the hub, and this may be the same spline or stud which holds the cam-ring against rotation independently of the hub. Surrounding the wear-piece are placed cam-wedges, which are curved on their inner faces and conform generally to the wearing-ring on which they rest. The outer face of each piece has an inclined surface and a projecting stop. The total length of the wedge-pieces is a little less than the circumference of a circle, leaving a space, into which space a pin, projecting from the side of the sprocket, enters. When turning forward, this pin or stud causes the wedge-pieces to partake of the movement of the sprocket-ring. Balls are interposed, and when the wedge-pieces are moved in one direction these balls find lodgment against the stops; but when the wedge-pieces move in reverse

direction these balls are wedged between the wedge-pieces and the cup, which incloses the end of the hub, and is secured to the side of the frame. Inside the cup there is preferably a groove, and in this groove, between the teeth of the wedges and the cup, are balls, having a limited movement when the sprocket-ring and wedge-pieces are moving forward. A reverse movement of the sprocket-ring causes the inclined faces of the wedge-pieces to wedge firmly against the balls, and thus press on the wear-piece, the balls being held against outward movement by a cup. The strains are all compression strains, except on the ring. The inventor is F. L. Clapp of Northampton, Mass., assignor to J. D. Keating of Middletown, Conn.

**Paper Rim.**—The illustration shows the shape of a wheel rim designed to receive two auxiliary pneumatic tubes. The rim

is formed of an inner body of paper pulp made from rhea fiber and an outer covering of a woven fabric also made of rhea fiber. This material is said to produce an exceedingly strong, tough and yet light rim. It will be noticed that a rim of this description takes the place not only of the steel or wood rim used on bicycles, but also of the outer casing used for double tube tires. The shape shown is produced from a tube by compression in a mould. The inventor is J. C. Grant, of London, England.

**Handle Bar Clamp.**—The post is made of tubing and in its upper end is brazed a plug which extends upward far enough to accommodate the clamp. Above the clamp it is reduced and screw-threaded to receive a binding nut. The clamp consists of a sleeve which receives the handle bar, and jaws bored to receive the plug. In practice the lower jaw is brazed to the upper end of the post and the up-

per jaw works freely on the plug. A triangularly shaped key piece with serrations on the broad side toward the bar is inserted between beveled faces on the sleeve portion of the clamp. When the sleeve is contracted, the beveled faces force the key piece against the serrated ferrule on the handlebar. The application for this patent dates back to 1894, was renewed in September this year, and the patent was granted November 8 to

# Stearns Bicycles

**M**ESSRS. E. C. STEARNS & COMPANY desire to announce that their models for the season of 1899 are ready for inspection and that their full force of traveling salesmen are now engaged in covering the territory assigned them, comprising the entire United States and Canada.

Each 1899 Stearns bicycle is new, distinctive, elegantly finished and equipped. The complete list is as follows:

MODELS	WEIGHT	PRICE
Chainless . . . . .	26½ pounds	\$75.00
Ladies' Chainless . . . . .	27 pounds	75.00
Cushion Frame for men . . . . .	23¾ pounds	65.00
Cushion Frame for women . . . . .	25¾ pounds	65.00
Special, 30-inch wheels . . . . .	21¾ pounds	65.00
Special, 28-inch wheels . . . . .	21½ pounds	60.00
Ladies' Special . . . . .	23½ pounds	60.00
Track Racer . . . . .	20 pounds	60.00
Model E . . . . .	24 pounds	50.00
Model F . . . . .	24½ pounds	50.00
Combination Tandem . . . . .	45 pounds	75.00
Diamond Tandem . . . . .	43 pounds	75.00

## EQUIPMENT

### TIRES

Models E, F and Tandem, Hartford No. 80.  
Other Models, Palmer.  
Options, Kangaroo and Morgan & Wright.

### SADDLES

E, F and Tandems, Garford 156, 158 and 161.  
Other Models, the above with Sager Flexible,  
Christy and Stearns Rawhide.

## CHARACTERISTICS

Light Weights.

Narrow Tread.

2¾-inch Drop.

The works of E. C. Stearns & Company are operated continuously. They are never "closed down" except Sundays and holidays.

A large number of 1899 Stearns bicycles are completed and ready for shipment.

During the season of 1899 all orders will be promptly filled.

The "advance" catalogue is now ready for distribution. It describes in detail the most attractive line of bicycles E. C. Stearns & Company have ever produced.

The trade on the Pacific Coast supplied from our branch store,  
E. C. Stearns & Company,  
210 McAllister Street,  
San Francisco.

**E. C. STEARNS & COMPANY**  
SYRACUSE, N. Y.

The trade in the Dominion of Canada supplied from our Canadian factory,  
E. C. Stearns & Company,  
67 Adelaide St. West,  
Toronto, Ontario.

W. G. Jones of Manchester, N. H., assignor to Hunter Arms Co. of Fulton, N. Y.

**Fredrick's Handlebar.**—This bar is already being manufactured. The head of the handlebar stem has a tapered aperture corrugated interiorly. The tapered surface is broken by a central recess to receive the disk-shaped inner ends of the two handlebar sections. These disk portions have tapered corrugated apertures formed to correspond in size and corruga-

tions to the aperture in the head. A taper block with external corrugations to fit the aperture in head and handlebar ends is bored out from the small end and tapped to receive a screw bolt with hexagon head. Tightening the bolt secures the bar sections in any desired adjustment. The inventor is E. H. Fredrick, of Toledo, O.

### SECRETIVENESS OF MAKERS

**Progress Checked by Close Guarding of Shop Secrets—Americans Interchange Ideas.**

The manufacturers of this country, as a rule, are inclined to impart information freely relative to the methods and processes which they use. The tremendous progress which the United States has made in economic production has undoubtedly been accelerated in no small degree by the willingness with which experiences have been exchanged and the freedom with which faulty methods have been criticised when found in use. Valuable points have been gained by visits interchanged between managers of rival establishments and by the publication in the technical press and the proceedings of technical societies of descriptions of new plant, new machines and new processes. Shop secrets may still be jealously guarded in small establishments making specialties for which the market is limited, but they are seldom heard of among manufacturers of staple articles. Advantages for securing raw materials, the employment of the most improved machinery and capable management are relied upon for profitable results to a much greater extent than any special process or method belonging to the particular plant. The branches in which open doors have been conspicuously kept are those in which achievements have been won that have startled the world. Mind has sharpened up mind, and every advanced step taken at one place has been a spur to a further advance somewhere else. The net result has been a vigorous growth and a continuous departure from the traditions of the shop, which always impede progress like the barnacles on the ship. No concern manufacturing staple products can safely claim to have found a process so far ahead of that used by competitors that it can afford to refuse to impart or receive information. Some active competitor will be at work devising a different and perhaps more economical way of doing the same thing. But those who

are unwilling to impart are almost invariably unwilling to learn, and in time must be beaten in the race for business, says Iron Age.

The explanation offered by the Iron paper seems a little far fetched; for those who have something to impart must have been willing to learn before they arrived at the point where their knowledge would be sought. It seems more plausible that those who have learned something in advance of contemporary industry are also most capable of learning something more. They gain by an exchange of courtesies, the fact that they have more to impart being more than balanced by their better ability for absorbing. They get suggestions for a valuable improvement from something which in the hands of a less able competitor is applied indifferently for some small and insignificant purpose. He who has something to impart is in advance of his competitors when he imparts it, and this priority which is advertised by imitation, establishes his prestige in trade. This prestige he continues to keep up by his ability. Hence he prospers by his liberal methods, but it would be futile to deny that there are instances in which a little caution and secretiveness constitute a useful exception to generally liberal methods. Those really gifted with ability will know how to draw the line, while those who close their doors by fixed rule will soon find that competitors and the public have divined the real reason for so doing, viz., that there is nothing to impart and that it is this fact which the institution most wishes to conceal.

### NON-AJUSTABLE BEARINGS

**Engineers Say Adjustability Is Unnecessary—Wear Not Appreciable—New English Hub.**

Cycle machinists have often been sneered at by engineers because of the margin allowed for adjustment in cycle bearings, says Cycle Referee. Certainly it should be possible to manufacture a bearing in which there should be no appreciable wear up to about 4,000 miles, if each bearing part is of perfectly hardened steel, carefully ground, and in all respects a finished bearing when assembled.

A Birmingham company has proceeded upon these lines to make a set of hubs and brackets which have no means for adjustment by the ordinary rider. By making one cup with a right-hand thread and the other with a left-hand thread, and each with a shoulder to come up solid to the ends of the hubs or bracket, an extremely neat and absolutely secure disc adjustment is obtained, and one which cannot be adjusted wrongly if taken to pieces any number of times. In all racing and ladies' machines it is confidently expected that the bearings will last without adjustment as long as the machine.

### WANT CASE HARDENING OVENS

**Repairmen Feel Need of Simple and Cheap Apparatus—Molecular Change but No Carbon.**

There is frequent inquiry among repairmen for a case hardening apparatus by which the hardened shell of cups and cones may be produced of even thickness and with greater assurance of always obtaining the same results from the same manner of working. Makers of such apparatus, if they exist, are not generally heard from.

A case has recently come under observation where a cup which was treated with new bone dust in the ordinary manner showed the same change in the molecular structure of the shell as is usually observable after case hardening, but nevertheless the shell was very soft and chemical analysis showed total ab-

sence of carbon. No explanation of the phenomenon has yet been given and the pedal maker in whose shop it was observed would like to hear from anybody who has had similar experiences or has an explanation to offer.

### Election Bets Attached by Maker.

Washington, Nov. 12.—Counsel for the Bellis Cycle Co., of Indianapolis, has secured a writ of attachment against Wilbur W. Marmaduke, a local ticket broker. The writ was issued on a judgment secured in 1896 by the Bellis company against Marmaduke, who at that time traded as the Washington Cycle Co. The total amount of the judgment was \$1,525.57. The writ was served on Orren G. Staples, a local hotel proprietor, who, it is alleged, acted as stakeholder for Marmaduke and a betting companion. It was learned by his creditors that Marmaduke had deposited a certain sum of money as election bets with Staples. As a bet is an illegal transaction, it is contended that the money can be attached, whether Marmaduke won or lost. Should he have won, however, it is doubtful if more than the actual amount which he put up could be recovered, in case his betting companion demanded the return of his money, as the same point of the illegality of the contract would hold good. Staples has not yet replied to the indictment, and the case will not be decided until he does. Condemnation proceedings against the money will have to be taken, in any event, before it can be collected. Some years ago Marmaduke contracted to handle the Bellis product. Later, the retail firm business was dissolved, and the Bellis company secured a judgment against him for certain money owing to them. Several attempts have been made to collect the judgment, but without avail.

### Utilizing Old Rubber.

A correspondent inquires of Cycle Age in regard to the most profitable way of utilizing old inner tubes and tires for making rubber solution, plugging cement, etc. The inquirer has a quantity of old rubber goods on hand and can get only 3 cents a pound for it. Manufacturers of macerator machines and others may be able to give the desired information, if improved methods exist for reclaiming rubber on a small scale. Cycle Age does not know of any improvements over the methods which have been in use for years, but will forward any information received.

### Berg's European Establishments.

Hart O. Berg, general manager of the new Clement works for making motor carriages and chainless bicycles under Pope patents at Levallois, near Paris, France, states that the Belgian establishment with which he was lately identified, the Fabrique Nationale d'Armes de Guerre, of Herstal, near Liege, is not connected in any way with the enterprises which Mr. Berg is now establishing at Paris and in Germany.

### Scorchers Adopting Rubber Pedals.

Rubber tread pedals are reported to be growing in demand in England, where even road scorchers are changing from the rat-trap to the others, which they find more comfortable for winter riding, where toe-clips chill the feet and the frozen ground causes numbness of the feet by vibration of the metal tread of rat-traps.

A firm of cycle dealers in Gem City, Ia., has fitted up a wood saw and is doing a rushing business. The resources of the versatile bicycle dealer are not easily exhausted.

## BOSTON MOTOR VEHICLE CONTEST

### Interesting Competition of Electric, Gas and Steam Vehicles—Surprising Hill Climbing Feats

This contest took place at Charles River Park, Boston, Nov. 9, 1898, under management of the Massachusetts Charitable Mechanic Association, and marks an era in the history of mechanical translation, as it is the first public event in which light steam carriages, suitable for the transportation of passengers, were shown. Motorcycle constructors have been aware of the power and flexibility of steam motors from the first, but it has

ment of motorcycles, one of the conditions of exhibition entry being that the mechanical wagons should be on show at the building in Huntington avenue, for the entire eight weeks of the continuance of the fair. This condition of continuous exhibition, while, perhaps, not an unreasonable demand on the part of the managers of the fair, was far from alluring to those experimenters who had only a single wagon in form to show, and who

No. 7. Haynes & Apperson, Kokomo, Ind., explosion motor.

No. 8. Heymann Vehicle Co., Melrose, Mass., explosion motor.

No. 9. Piper & Tinker, Waltham, Mass., steam motor.

No. 10. Pope Mfg. Co., Hartford, Conn., storage battery.

No. 11. Riker Electric Co., Brooklyn, N. Y., storage battery.

No. 12. Whitney Motorwagon Co., Boston, Mass., steam motor.

Of these announced contestants there appeared at Charles River Park Nov. 9, Nos. 2, 3 and 4, the three French gasoline engine driven machines, all noisy, all delivering vilely offensive odors in abundance, none carrying their passengers in any degree of comfort, all with very small wheels and insignificant in appearance, and all thoroughly efficient and reliable in performance, except for hill climbing. One of these machines is shown in Fig. 1.

No. 5, the Duryea, failed, for the first time in any public motorcycle event in

always been the fashion to speak of steam driven carriages as suitable only for heavy work, such as freight carrying, because the minds of the motorcycle builders held pictures of ordinary steam boilers and engines, such as the English engineers have applied to their cumbersome "lorries," and had no conception of such steam boilers and engines as are produced by the Boston group of steam carriage makers, and which enable these advanced exponents of the art of automobilism to show easily managed and odorless carriages, having no objectionable features whatever and weighing less, and costing less, than any other reasonably comfortable four-wheeled mechanically operated vehicles yet exhibited.

#### Eight Weeks' Exhibition Required.

The Massachusetts Charitable Mechanic Association holds a fair and exhibition annually which is always of much interest and largely attended, and this 1898 event was enriched by a special divertise-

were in many cases still engaged in perfecting the details of that one. As it proved, the speediest, lightest, cheapest, and cleanest automotor of unlimited range shown at Charles River Park, was there merely on exhibition, and was not a contestant for prize money because its builders and owners, the Stanley Brothers, of Newton, Mass., did not feel as if they could interrupt their experiments by placing their only completed vehicle on exhibition for two months.

#### Twelve Entries Received.

The following was the projected list of contestants:

No. 1. S. J. Anderson, Waltham, Mass., explosion motor.

No. 2. Leon Bollee, Paris, France, explosion motor.

No. 3. De Canville Co., Paris, France, explosion motor.

No. 4. De Dion et Bouton, Paris, France, explosion motor.

No. 5. Duryea Mfg. Co., Springfield, Mass., explosion motor.

No. 6. Eaton Electric, Boston, Mass., storage battery.

America, to put in an appearance. There was a Duryea wagon on the grounds, owned, it was said, in Holyoke, Mass., but it took no part in the contests. The absence of the Duryea is greatly to be regretted, as this vehicle is among the most successful of American exhibition contestants, and has been a frequent winner in the past.

No. 6, the Eaton Electric, was present, with the first vehicle produced by the Eaton company, shown in Fig. 2. This carriage was begun Sept. 9, 1898, and first placed on the road Oct. 31, 1898. It is a vehicle of fine appearance, and carries the batteries entirely separated from the wagon body, in a receptacle hung from the side-bars of the frame on independent half elliptic springs. A full description of this carriage will be given later. The Eaton electric was at the park for exhibition purposes only, and took no part in the contests.

No. 7, Haynes, Apperson & Co., Kokomo, Ind., was shown in a Boston built

vehicle, in charge of Mr. O. H. Perry; it was said to weigh 1300 lbs., and to have three forward speeds and one backing speed. The explosion engines were said to be 4 h. p., and it was said that 5 gallons of gasoline would drive the wagon 100 miles, and that the cooling water tank held 10 gallons and required to be refilled three times per day, when on the road. Mr. Perry has prudent views as to the disclosure of his mechanical details, which, so far as could be seen, appeared to consist of all the sprockets and chains and friction clutches the wagon body would hold, hence no particular description can be given. Fig. 3 gives a good idea of the external appearance of this Boston Haynes and Apperson carriage.

No. 9, the Heymann, and No. 10, the Piper and Tinker, did not appear.

#### Pope Carriage Damaged in Shipping.

No. 10, the Pope Mfg. Co., Hartford, showed an elegant carriage, which, however, took no part in the contests. It was said to be the intention of the Pope company to show its new explosion engine driven delivery tricycle on this occasion, but that some connection of the gasoline tank had been injured in transportation, so that the machine could not be brought out. The Pope carriage is shown in Fig. 4.

No. 11, the Riker Electric, showed two fine vehicles, a luxurious two-passenger carriage, which should by rights have been in the hands of its London purchaser on that day, and a tricycle arranged to carry two or three passengers in comical ease; this Riker electric tricycle is shown in Fig. 5.

No. 12, the Whitney Steam Motor Wagon Company, of Boston, showed two of their steam engine driven carriages, as very recently fully illustrated and described in these columns. Mr. Whitney informs me that neither of these wagons was fitted with his best burner, and his burning of gasoline, the fuel with which steam is generated in his boilers, was not so perfect as to be odorless. In fact, the Whitney wagons shown at Charles River Park were as undelightful in smell as the French carriages, or the Haynes and Apperson wagon.

The 9th of this November was in Boston as fine and warm as could have been expected in early September, the weather being really delightful, and the affair was extremely well managed, all of the events transpiring promptly, and the only real blemishes being caused by the competition of tricycles and four-wheelers for showing the facility of handling and manageability, which was wholly unfair to the larger vehicles.

The course at Charles River Park is an asphalt cycle track, 3 laps to the mile, which the electric carriage exhibitors considered unfit for a speed trial of their heavy wagons.

#### Protest Against French Tricycles.

The first function was a grand parade on the course, with the Riker electric in the lead. The electric carriages, presenting a noble appearance, and the Whitney steam carriages, in forms closely approximating ordinary American road vehicles, were in strong contrast to the diminutive and low-seated French 4-wheeler, and the French tricycles, which were made decidedly insignificant in appearance by the comparison. It must not be understood that the French machines were insignificant in performance, however. Quite to the contrary, they managed to capture about all the money in sight, although they would not have had the \$500 first money for speed, had the Stanley wagon been a contestant instead of a mere exhibitor by courtesy, nor should the French tricycle have had the first prize for manageability, because there can be no comparison of manageability between

a 4-wheeler and a tricycle, or between a tricycle and a bicycle on this point. The fewer the wheels, the more readily the vehicle can be made to avoid obstacles, and the admission of the tricycles to the manageability contest on even terms with the 4-wheelers, was urgently protested by Mr. Riker at the outset.

#### The Speed Races.

The first contest was a 2-mile pursuit race between two Whitney steam wagons, No. 12 driven by Whitney, and No. 15 driven by Scott, which was won by Whitney in 1:04 2-5.

The second contest event was a 2-mile time run by the Whitney steam wagon No. 12, Whitney driver, made in 5:40 2-5; it must be borne in mind that this run was on a 3-lap cycle track, with turns altogether too short to suit any 4-wheeled vehicle. Whitney says he has often made a straight-away mile inside of two minutes; his 1000-lb. wagon is altogether too heavy for top speed on a 3-lap cycle track.

The third contest was a 2-mile pursuit race between the Haynes and Apperson wagon and the De Dion 4-wheeler, won by Haynes and Apperson in 7:42 4-5.

#### Brake Tests.

The fourth event was for brake efficiency between Riker and Whitney, won by Riker, much to his own surprise, as his wagon was almost double the weight of the Whitney carriage. Distance from brake line to stop, 8 ft. 7 ins. Speed at time of applying brake was about 5 or 6 miles, apparently.

The fifth contest was another brake competition between Haynes and Apperson and De Cauville, won by Haynes and Apperson.

It may be noted here that none of these brake contests seemed particularly decisive, as there was no means of obtaining a uniform speed at the time of brake application, which is an evident necessity for comparisons based on distance run after the brake is on.

The sixth exhibition was a pursuit race between Whitney in his steam wagon, and the De Dion; this was a final and was for some time in doubt. Whitney lapped the De Dion at one time, but could not obtain the pistol shot, and the De Dion finally drew away and won in 5:01 2-5 for the two miles. This victory of the De Dion was something of a surprise to those who knew what the Whitney wagon could do on a straightaway run, and might not have gone as it did had Whitney been less confident of victory.

#### Hill Climbing Contest.

The hill climbing was extremely interesting. The track was made of plank laid crosswise of the course, and was 85 feet long, with the first 10 ft. level, the next 10 ft. at an angle of 5 degrees, the next 10 ft. 15 degrees, and so on, the 85 feet of track ending at a cross bar stop high in the air, the final angle being 35 degrees. This makes a constantly increasing up hill angle of track, which is vastly difficult. Some seemingly powerful cycle riders tried it with a flying start, but could not go much above half way up. The De Dion, which won the time event, could not do nearly so well as half way. Riker made a very good showing with his heavy carriage, and so did the Haynes and Apperson, which gave evidence all the way through of being well powered. Whitney, with a hundred pounds of steam, did no better than Riker with his electric, which was hardly expected to show so well in hill climbing, because of its great weight. These wagons ran up beyond their brake control, and had to be caught by men standing on the incline, and steadied down to where they could take care of themselves.

Stanley had appeared with his 400-lb. steam wagon, which has larger engines

than the Whitney wagons, weighing two or three times as much, and also, I fancy, had more steam pressure, not less probably than 140 lbs. to the inch, while Whitney had only about 125, I think, at most. Stanley and Whitney had practically the same boiler, and both used a chain reduction to the compensating gear box, so that, with one exception, there was little difference in the motive power or transmission elements of the two vehicles; the one difference between the two, was, however, at a vital point, Stanley having a perfect burner under his boiler, while Whitney's was by no means so good, nor was it equal to other burners which he has applied to boilers. Whitney received a peremptory notice to place his wagon on exhibition, and was forced to send it to the Mechanics' fair as it stood, or stay out. Undoubtedly Whitney should have been prepared for this, and should have had at least one of his wagons in the best form he could produce, but it is only fair, in my opinion, to state that neither of the Whitney wagons at Charles River Park showed the best combustion that Whitney has produced in a steam carriage.

#### Stanley's Mile in 2:11.

An exhibition mile run by Stanley was announced, arousing great interest, as the Stanley wagon had won many friends by its perfect absence of odor, and the ease and celerity of its movements, and its almost perfect silence.

Amidst great cheering Stanley finished the mile, 3 laps be it remembered, in 2:11. At the sharp end turns the carriage went high up on the bank, but I think Stanley drove for all his engines could do. His 2:11 time was better than was to have been expected. At Stanley's top speed the connecting rods and cranks were invisible, and the noise of the exhaust was an agreeable hum, almost a musical note, there being 3348 puffs per minute. The exhaust steam spread out in a thin grey veil, and did not extend, I think, to exceed six feet in the rear of the wagon.

After this run came the manageability trials.

#### Steam Wagon Mounts Steep Grade.

Then Stanley took the hill, running up to the top, and bumping the cross bar at the end from a standing start at the bottom of the incline, no headway run on the level being made. Stanley probably had 150 lbs. boiler pressure for this hill effort. Thirty-five degrees is a very precarious foothold angle, and it looked for an instant as if Stanley was going to come down with a rush, but after some hurried scrambling the wagon was seen to be under control.

Whitney took a turn at the hill with 125 lbs. of steam this time, and went very near to the cross-bar; his wagon was the easier to control on the return, as Whitney's engines reverse, while Stanley's do not, but it was all the "catchers" could do to check the Whitney carriage on the 35 degree slope, at first. Stanley said before he started up the hill that he could easily run over it, if there was a practicable incline down on the other side. The designers of the hill did not for an instant fancy that any wagon could come near the top of it.

There were about 2000 spectators present, many of them deeply interested in automobile translation, the weather was perfect, the management was prompt and faultless, and the steam wagons were a new and surprising feature, and a feature, by the way, which seemed to be held at its real probable value rather by the untechnical observers than by the motorcycle engineers present.—HUGH DOLNAR.

A large trade is carried on in exporting worn-out tires to Germany for the manufacture of rubber toys for children.

## A Reliable Pilot

The victory of a nation is in the hands of the man at the helm. He guides the great "war dogs" into a successful, victorious position—a position that every maker, jobber and dealer is striving to attain for his bicycles.

### The Claus Handle Bar

✂ ✂ ✂ ✂ will pilot many a wheel to victory—business victory—in 1899.

Everybody wants it.

It will be the guide by which people will recognize a high grade bicycle. And it's a reliable guide—a wheel cannot be high grade, all over, without the Claus Bar.

People will ask the dealer to furnish the Claus because we are telling them of its merits.

Everybody wants an adjustable bar. Almost everybody wants an adjustable bar that can be adjusted without a wrench. The Claus adjustment requires no wrench—only a finger and thumb.

Physicians advise proper lung expansion when cycling. Every adjustable bar but the Claus contracts the chest at all but one or two positions—the Claus retains its proper, healthy width at all positions.

The Claus guarantee never expires—a guarantee that shows the faith we place in the durability, strength and quality of our bar.

These are not mere arguments—they're facts—plain, simple, truthful, unvarnished facts. Facts that ought to guide every bicycle manufacturer, jobber and dealer in his handle-bar purchases.

Think a bit, then send us your orders. At any rate write for our money-in-your-pocket prices.

**The Claus Handle Bar Mfg. Co., Milwaukee, Wis., U.S.A.**

## MOTOCYCLE BUILDING NOT EASY DIFFICULTIES ARE UNDERRATED

### Lay Public Inclined to Think It a Simple Matter to Combine Motor and Carriage Body.

A few days ago a man who has built machinery of various kinds since he grew to manhood, came to the Cycle Age office and wanted information in regard to makers of gasoline motors. He wanted a motor "right away," so much so that he insisted upon getting it from a Chicago manufacturer; for he was going to fit it to a vehicle with which a customer intended to "go prospecting." This customer is a miner and intends to cover the distance from Joplin, Mo., to the Pacific coast, with many digressions, per motor vehicle. The desired vehicle should be capable of carrying him at least 100 miles without new fuel supply. The Cycle Age editor was unable to inform the visitor of any Chicago concern which kept such motors in stock and expressed his doubts in regard to the feasibility of the scheme of producing a practical motor vehicle by the rough and ready means proposed. Several concerns ranging in location from Oakland, Cal., to Boston, which make motors for vehicles were recommended to his attention. But no; Peoria, Ill.; Kokomo, Ind.; Lansing, Mich., to say nothing of Pittsburg and New York, were too far away. He wanted a motor bought from stock. Any little changes which might be necessary, he would attend to. Difficulties! why, no; they were only imaginary. Motor vehicle builders simply charged an enormous price, he thought, for something that any machinist could build and put into a carriage. He, for one, was not going to be fooled by these pretensions. He finally concluded to go to a maker of gas engines on Canal street, Chicago, and have one made. The projected carriage was to be ready within two months, but no drawings had been prepared nor any account taken of any problems whatever except that of causing the axle of a wagon to revolve by connecting it with the piston of a gas engine, in "any known and suitable manner."

#### Threatens Danger to the Industry.

The greatest danger to the motorcycle industry is revealed in that disposition to underrate the practical importance of its peculiar problems of which the inquirer furnished an example. There are undoubtedly thousands like him and many of them will succeed in attracting a little capital and will turn out useless vehicles that will prejudice considerable portions of the public against vehicles made by more competent parties. In no other investment except perhaps mining is small capital likely to be lost so completely as in the motor vehicle industry, if the impression is allowed to prevail that the problem of connecting a motor with a wagon in a practical manner is a simple one, or that the selection of motor construction is within the grasp of anybody with a general understanding of engines or gas engines.

#### The Cycle Makers' Field.

On this subject, and the application to bicycle shops especially, the editor of The Cyclist has the following to say:

Motor making is "no catch"—that is to say, there is a very great deal more in it than merely manufacturing a certain number of pieces of metal and putting them together in the form of a motor. A very considerable amount of special knowledge and experience is required to turn out a satisfactory article—how much only those who have actually tried, and perhaps failed,

know. There is an old saying that "A child may lead a horse to water, but the king himself cannot make him drink," and so it is in a comparative sense with motors. Any worker in metals can manufacture a motor, but it requires an expert to make it go satisfactorily. As a matter of fact, we know of firms today who have spent as much as £4,000 or £5,000 in experiments, and having utterly failed in the task, have given it up as a bad job. This more particularly applies to the manufacture of new motors, for inventors are many and various, and all enthusiastically believe that if their ideas could only be put into practice, all existing motors would be superseded, so we would warn manufacturers against being readily induced to experiment in the direction of new motors. If they make a motor at all, let them adopt one which has been tried and proved not to be wanting in actual use upon the road.

The cycle maker, however, will for the most part be better advised not to touch motor making at all, but to purchase this important part of the machine from firms already in the business. It is true he will have to pay more for it than if he were making it (satisfactorily) himself, and he may even have to pay something in the shape of royalty for such a thing as a license, but, as we have briefly indicated above, it will be quite worth his while to do this, and he will be money in pocket in the long run. To manufacture motors will require much machinery of a class which he does not as a rule possess, and this alone will doubtless be a factor in assisting him to a decision. Then as to the type of vehicle to be made. No cycle maker, without very materially increasing his plant by the laying down of a totally different class of tool from that which his works usually possess, can readily manufacture cars of the heavier type. This is purely heavy engineering work as apart from cycle making, and, therefore, the situation narrows itself down to this:

That the cycle maker will find that the best way in which he can enter the motor industry is to confine his attention to the construction of motor cycles, or the lighter form of cycle-built cars, in which tubular framework, cycle wheels, and ball bearings are the principal construction features. In doing this he will be well advised to make the best arrangements he can for the use of the best and most fully-proved motor obtainable, and then to devote his attention to the design and construction of a suitable cycle-built carriage to go with it; and in the making of motor cycles, if he decides to adopt that type which is nearest of all to his manufactures, viz., the motor tricycle, or even the motor bicycle (which latter we do not altogether recommend), he must not overlook the fact that it is not sufficient to buy a motor and make a tricycle, and put the two together, but in making a tricycle practically every part will have to be specially made. It will not be sufficient to merely take one of his standard pattern three-wheelers and fit a purchased motor to it. Such a course would quickly end in failure, for the strains which the motor cycle is called upon to bear are very different, and very much more severe than anything which the man-propelled machine ever meets with, consequently, even in this, the easiest branch of the industry for him to take hold of, special experiment and special construction throughout are called for, and from this it will be apparent that to enter the motor business will require a certain expenditure of both time and money. Just how much will depend upon the class of machine adopted, and the skill and ability of the cycle maker; and he must not expect to reap a fortune all at once.

#### Motor Vehicles for Mail Service.

Recent advices state that the Postoffice Department in England has under consideration the project of supplying electric and other motor vehicles to be used in the postal service of London. The engineering department is now considering propositions from various manufacturers with that end in view.

#### Motor Show in Berlin.

An international motorcycle show will be held in Berlin next May. All kinds of automobiles will be admitted and also all motors, machinery and accessories for motor vehicles.

Mr. Jeffery of Gormully & Jeffery has lately been visiting manufacturers of motor vehicles and this has given rise to the rumor that his company will shortly embark in this new branch of manufacture.

## MOTOR CAB SERVICE OF PARIS PLANS FOR RAPID EXTENSION

### One Thousand Vehicles to Be Ready for Use When Exposition Opens—Teaching Drivers.

Paris, France, Nov. 4.—The fifteen electric cabs which the General Cab Company of this city has ready for service are at present exclusively used in converting cabmen into "chauffeurs," but within a month there will be twenty of these vehicles on the stands, and by the time the exhibition of 1900 opens, the company expects to have one thousand vehicles plying for hire at the ordinary fares. There are three models which the company intends to adopt, the closed coupe, to seat four persons; the open victoria, also to carry four passengers, and a landau that can be used either closed or open. The mechanism in each case is the same, the battery being placed beneath the body of the vehicle and the driver sitting in front as on the ordinary cab.

The batteries will be charged at the electric works of the company at Clichy. The process takes seven hours, but as the batteries are removable, the only inconvenience is the necessity of returning to the stores to take on fresh batteries.

#### Training School for Drivers.

The movement is so far serious that the company has established a training school for drivers, selected from the cabmen. They are instructed under the supervision of Mr. Gourdon, manager of this department, and, according to a representative of the Temps, the process is as amusing as it is quaint. The practice ground is covered with dummy figures of old gentlemen, "bonnes" and children, nurses with perambulators, dogs, etc. The apprentices are started off among a crowd of these dummies, and from the observations of 'he Temps appear to be taught how near they can drive to the various manikins without knocking them over. It is only to be hoped that they will be taught to show a little more respect for pedestrians than does the Paris Jehu.

## ENGLISH BICYCLE MOTOR

### Birmingham Company Preparing to Market One That Can be Fitted to Any Roadster.

The Wolseley Sheep Shearing company of England is preparing to place a motor for bicycles on the market, says Cycle Referee. The motor is extremely compact and easily fixed in the frame of any existing roadster bicycle without interfering with the pedaling movements of the legs. The weight will hardly exceed fifteen pounds, while the price will be about \$5 per pound. If the expectations of the makers are fully realized, says the Referee, the effect of this introduction will be felt throughout the whole English trade. Not only will manufacturers be able to fit the motor to their existing patterns, but assemblers will be able to do the same thing.

The attachment of a motor to an unstable vehicle like the bicycle has never seemed practicable to American manufacturers, but the English company's experiment will at least afford an opportunity for making observations in regard to the public's willingness to take the chances of a fall with a piece of moving machinery, and possibly a more general application of motors to tricycles will be the eventual result.

# The Wonderful Sager Gear

## The Ideal Chainless Mechanism

### WORLD'S RECORDS

Made at Woodside Park, Philadelphia, by Major Taylor, on an ORIENT wheel fitted with Sager Gear.

November	4.	.....Kilometer.....	:57 <sup>3</sup> / <sub>5</sub>	Seconds
"	5.....	1-4 Mile.....	:22 <sup>2</sup> / <sub>5</sub>	"
"	4.....	1-3 Mile.....	:29 <sup>4</sup> / <sub>5</sub>	"
"	5.....	2 Miles.....	3:13 <sup>3</sup> / <sub>5</sub>	"
"	12.....	1 Mile.....	1:32	"
"	12.....	1-3 Mile.....	:28 <sup>1</sup> / <sub>2</sub>	"
"	12.....	1-2 Mile.....	:45 <sup>4</sup> / <sub>5</sub>	"

Above records made with temperature at freezing point and under other unfavorable conditions.

Superiority of chainless wheels equipped with Sager Gear fully established.

No purring under the feet. Absolute smoothness. Will out-wear the rest of the bicycle. Runs easier than the chain. Gears encased in dust proof cover.

Sold to manufacturers under contract that machines fitted with this gear shall not be retailed at less than \$75.

## SAGER GEAR COMPANY

ROCHESTER, N. Y.

# INFORMATION FOR BUYERS

## FREDRICK ADJUSTABLE BAR.

The new bar shown in the accompanying drawing is being introduced by Fredrick Mfg. Co., 220 Broadway, New York. The stem and head are integral and are made in a single drop forging for the sake of strength. The knuckles are also drop forged. The circular extensions of the head and ends of the knuckles are machined with teeth internally to fit a tapered ratchet which is inserted after the parts are assembled. A short screw bolt working in a counter-sunk socket at the rear of the head draws this plug firmly into its socket and locks the bars

rigidly in their adjusted position. By this construction there is unlimited range of adjustment, from the highest upturned to the lowest drop position. Grips remain at a constant angle to the machine at all times. All joints are flush and no bolt heads protrude. An invisible internal expander will be furnished by the makers when it is desired. The makers assert that the adjustment is not only extremely simple but is strong and positive, and impossible to get out of gear or work loose. Changes in adjustment can be made very quickly and easily by the use of wrench or screwdriver. The Fredrick bar is symmetric and neat in appearance and the makers state that it is unexcelled in quality and finish.

## BUESCHER PUMP COUPLER.

This little device, made and marketed by Buescher Mfg. Co. of Elkhart, Ind., is extremely simple, but saves all the trouble and loss of time incident to screwing the usual hand pump connection on to the valve before inflating the tires and afterwards unscrewing it, which so frequently results in loosening the valve in the stem. It consists merely of a metal cup, inclosed within finger bars, and a cone-shaped rubber cap seated in the metal cup, a hole being provided in the center of the rubber cap for the passage of air from the pump to the valve. This rubber seat is held against the valve

and makes an air-tight connection. The invention is protected by the company's patent of July 14, 1896. Its sale will be pushed energetically this season.

## THE ANDRAE LINE INCREASED.

The 1899 Andrae line, made by Julius Andrae & Sons Co., of Milwaukee, will be larger than ever, the increase being due to the addition of several low-priced machines, which will enable agents to meet all demands as to price, and still handle the Andrae line exclusively. The '99 line consists of thirteen models, including a triplet, three tandems, a chainless, a 30-inch wheel model, track racer, road racer, and six models of light roadsters for men and women. The Andrae triplet and tandems (racer, double diamond and combination), are built on the same lines as the '98 models, with the exception of some minor changes. The triplet will list at \$150 and the tandems at \$100 each. The Andrae chainless will list at \$75, as will also the Andrae track racer and road racer. The two racing models are built very light, without sacrificing the rigidity of the models of 1898. The regular light roadsters for men and women will list at \$50, \$40, and \$30; the 30-inch wheel model is built on the same lines and with the same specifications as the light roadster, and lists at \$55. The company's large new factory, which is now running with a full force of work-

men, increases the capacity of former years by fifty per cent. The factory is equipped throughout with modern machinery. A complete electric light and power system has also been installed. The eastern business of the company is handled through their New York branch, at 95 Reade street, with Chas. L. Wilson in charge.

## REMINGTON CYCLES FOR NEXT SEASON.

Remington Arms Co. of Ilion, N. Y., is bringing out a Remington model for '99 which possesses a number of new features that will, it is anticipated, "make competitors shudder." This machine, which will be the Remington standard roadster, will retail at \$50. The makers have adopted Dunlop detachable tires, but will supply Kangaroo single-tube tires when demanded. A traveling force sufficiently large to visit every town of 3,000 population and more during the months of January, February and March has already been engaged. Stock will be distributed from Boston, Ilion, Chicago, and San Francisco.

## WILSON'S UNIVERSAL BICYCLE SPRING.

This is a device intended to secure that easy motion of the saddle when riding on rough roads or crossing tracks, etc., that has been the object sought by all constructors of spring frame bicycles. In this the jolting and vibration is absorbed by a long coil spring attached at one end to a clamp fastened to the seat mast just below the saddle and at the other to the end of an auxiliary pair of forks fulcrumed in the fork end lugs two or three inches from its own rear extremities in which the axle of the driving wheel is supported. An idle wheel is pivoted on a depending arm of the auxiliary forks to support the lower ply of

the chain in its usual position. The entire mechanism is attachable to any standard cycle frame on the market without alteration, weighs only two pounds, and the spring is adjustable to suit riders of different weights. The manufacturers are Bridgeport Cycle Spring Co., 257 Main street, Bridgeport, Conn., who, describing the operation of the attachment, state that, mechanically speaking, the bicycle frame becomes a lever of the second order fulcrumed on the axle of the front wheel, supporting 75 to 80 per cent of the superimposed load on the axle of the rear wheel, with a spring resistance interposed between the frame and rear axle; the spring having sufficient resiliency to absorb the average vibration due to the unevenness of the roadway, and cushion every shock, no matter how severe.

## COMPRESSED CORK GRIPS.

These are made in all sizes and with every style of tip—composition, embossed and plain nickel—and with or without paper lining, by Codling Mfg. Co., of Bristol, Conn., which guarantees that its compressed cork grips are of the best quality. The trade and public are so well acquainted with these grips that the good qualities of compressed cork for bicycle handles need no exploiting. What jobbers and manufacturers are interested in is the capacity of the Codling plant to turn out 5,000 pair daily and the consequent ability of the company to fill all orders promptly.

## BARTLETT'S NEW CYCLE SKATE.

The two-roller skate here illustrated is the invention of J. F. Bartlett, 102 Reaper block, Chicago, who has studied and experimented for the past two years to produce rollers that would stand the excessive side stresses and wear which quickly ruined many of the rubber wheels fitted to the early cycle skates. The rollers of the Bartlett skate are made of rubber composition molded under about 125 pounds' pressure upon a polygonal axle having radial arms to prevent the rubber working loose and turning on the axis. These

rollers are about three-quarters of an inch thick and run upon ball bearings of turned steel. They have rounded treads to provide for inclination of the skate, as the axles are fastened rigidly in the brackets and do not turn as do the trucks of four-roller skates. The skater in describing curves raises the foot upon only one roller. The rubber in the wheels prevents side slip. Patents granted and pending cover the construction of these rollers. The body of the skate is of entirely new design and construction. It is pressed from a single piece of sheet steel, the brackets for the rollers being simply lateral extensions of the foot plate bent

downwardly and inwardly to the proper position. The usual "club skate" clamping and adjusting device for attaching to the sole of the shoe is provided. This construction is so cheap and withal so simple that the Bartlett skate seems unusually well adapted for rink purposes. The inventor has up to the present produced only one pair of the perfected models, and as he lacks the facilities for manufacturing them on a commercial scale, desires to interest some bicycle manufacturer or capitalist in them. Dies and machinery for their production, he states, will cost upwards of half a thousand dollars.

## BURGESS LEAVES STEBBINS COMPANY.

M. D. Stebbins Mfg. Co. of Springfield, Mass., makers of the Chilion wood frame bicycles, announce that H. L. Burgess is no longer connected with the company, having left to enter upon a new field of labor, and at a meeting of the directors H. D. Stebbins was elected to the office of treasurer thus vacated, and in the future will discharge the duties of both secretary and treasurer. The executive officer will be W. M. Kidder, with title of manager. It will be the policy of the company henceforth to promote the interests of its agents in common with its own, both by maintaining a high standard of quality in its machines and by liberality in its dealings.

## FOOL-PROOF CHAIN CONNECTION.

A chain locking link and bolt arrangement which is so simple that the most unmechanical of riders can manipulate it without difficulty or danger of destroying its utility,

is being brought out for the season of 1899 by Indiana Chain Co. of Indianapolis. The usual threaded bolt is supplanted by an ordinary pin having annular shoulders at either end, and the two sideplates have keyhole slots whose enlarged ends permit these shoulders to pass. To make the connection the pin is inserted through these sideplates and the link and the slack in the chain is then taken up, which seats the pin ends in the reduced ends of the keyhole slots and makes a safe connection. No tools are necessary in coupling or uncoupling this device.

## SELLING AGENTS FOR WEBB EXPANDERS.

Herman Boker & Co., 101 Duane street, New York, have been appointed sole eastern selling agents, and Guiterman, Rosenfeld & Co., 35 South William street, New York, sole export selling agents for the Webb expander, manufactured by Sanford & Pollow Co., 235 Lake street, Chicago. This compact device for locking handle bars and seat posts, which was illustrated in the October 6 issue of Cycle Age, is made in six sizes, as follows:

11-16 in. inside and 7/8 in. outside diameter for 1 in. tubing of 16 gauge; 3/4 in. inside and 15-16 in. outside diameter for 1 in. tubing of 22 gauge; 13-16 in. inside and 1 in. outside diameter for 1 1/4 in. tubing of 16 and 22 gauge respectively; 7/8 in. inside and 11-16 in. outside diameter for 1 1/2 in. tubing of 22 gauge; 15-16 in. inside and 1 3-16 in. outside diameter for 1 1/4 in. tubing of 22 gauge; and 1 in. inside and 13-16 in. outside diameter for 1 1/4 in. tubing of 22 gauge.

**THE COLLMER HUBS.**

The hubs made by Collmer Bros. of South Bend, Ind., are disk adjusting hubs of such simple construction that, in the words of the makers, "a blind man can take them apart and put them together, and he can't help but do it right." It is claimed to be

impossible to put the hub together wrong. A removable barrel or axle is screw threaded internally at its ends to receive the screw threaded ends of the cones. Two hardened steel pins abut against the centers of these cones and at their inner ends contact with a conical headed screw in the center of the barrel. Ball retainers hold the balls in place on the cones, and after this internal barrel, together with cones and balls, has been inserted in the outer barrel, the cups are screwed into the ends of the latter. The outer ends of the cones are squared off on two sides to fit in the forks end slots and prevent turning. Screw bolts enter the ends of the cones and hold the hub in the frame, from which it can be easily removed without disturbing the adjustment of the bearings. To adjust the bearings in case of wear, a key is inserted through a hole in the center of the hub and the conical headed

screw is loosened to unlock the axle from the cones, then, leaving the key in place, the wheel is turned backward or forward, causing the tubular axle to turn on the cones and force them further apart or draw them closer together, they being threaded right and left. The proper adjustment secured, the key is turned to lock them by means of the spreading pins. The Collmer hubs are turned from solid bar steel, no stampings or castings being used. James E. Plew, 1446 Wabash avenue, Chicago, is sales agent for them.

**ANTI FRICTION FOR CHAINS.**

Useful Supply Co. of Williamsport, Pa., is in the market with a lubricating compound called Anti-Friction, which it packs in handy form in 2-oz. tin boxes and in collapsible tubes. That in the boxes is intended for use on chains and is of the consistency of vaseline, while that in the tubes is more liquid in form and can be squeezed into the cups of ball bearings. It is translucent, of Brewster green color and has the agreeable odor of almonds.

**BLISS CO.'S PICTORIAL CATALOGUE.**

E. W. Bliss Co., Borough of Brooklyn, has issued a large catalogue of heavy plate paper showing a score of full page half tone illustrations of the exterior of its factories and of various departments inside, and also many fine wood cuts of the large line of machine tools made by this company and extensively used in the cycle industry. It is a most attractive book, and will be found valuable by any one contemplating the installation of new metal working machinery.

**JARVIS TAKES A PARTNER.**

W. B. Jarvis, of Grand Rapids, Mich., who placed on the market last season a leather grip which was adopted by a number of the leading manufacturers, including H. A. Lozier & Co., and which was handled by a number of the leading jobbers, including A. G. Spalding & Bros., has taken as a partner in this branch of his business W. Smalley Daniels, for a number of years with the Plymouth Cycle Co., and later with the Hamilton-Kenwood Co., and the new firm is now better prepared than ever to supply the manufacturing and jobbing trade with leather grips. The new firm has secured as superintendent of the factory C. E. Peterlein, who is responsible for many recent improve-

ments in bicycle grips, including the wood lining or bushing, the single-piece cork grip and the J. & D. leather grip. Among other good contracts recently secured by Mr. Jarvis is one to supply the entire Lozier product with his leather grip. Both members of the firm are young men and enjoy a wide acquaintance among the manufacturing and

jobbing trade. Samples of their Leather grips will be sent to manufacturers and jobbers, and electros for catalogues will be supplied upon request.

**CEMENT AT WHOLESALE ONLY.**

American Trading Co., 100 William street, New York, correcting an error in last week's issue of this paper regarding the marketing of Hard Red tire cement, states that it is not seeking to sell to retailers at all, and would have to refer such applicants to jobbers.

A. G. Spalding & Bros. of New York and Chicago, have bought out the Spalding-Haywood Arms Co. of Denver, Colo., and will use the store as a branch distributing house for Spalding bicycles and sporting and athletic goods. Retailers of the far west will draw their supplies from the Denver house at the same prices as from New York or Chicago. Bryan Haywood will remain as manager of the Denver branch.

Chas. F. Stokes of Highlandville, Mass., writes that a number of inquiries as to prices and terms for the Excelsior hubs described in Cycle Age for October 27, have been addressed to Chas. F. Stokes & Sons Co., at Highlandville instead of to Chas. F. Stokes & Sons, 56 Fifth avenue, Chicago. The hub business is done in Chicago and correspondence in regard to hubs should be sent to the Chicago address.

Mention The Cycle Age

ELMIRA, N. Y., U. S. A.

years, have removed from 197 South Canal street to 250 West Lake street. The new location is in a large manufacturing block, where they will have ample room to grow as the business expands. Their capacity at the present time is 3,000 pair per week.

O. P. Bernhart, for the past two or three years connected with Kirk Mfg. Co., of Toledo, and at present in charge of the local retail store, will soon go on the road for the makers of the Viking bicycles and in the early spring will assume charge of the Viking retail store in Toledo.

Eaton Mfg. Co. of Eaton, Ind., has purchased the business of Old Fort Mfg. Co. of Fort Wayne, Ind., and will continue to make the goods formerly made by the Old Fort company. The plant in Fort Wayne is being put in proper condition to take care of trade with promptness and method.

Relay Mfg. Co. has announced its prices for '99, which will be as follows: Racer, \$60; Flyer, \$50; Special, \$40; Vox, \$30. Their 30-inch wheel patterns, with  $3\frac{3}{4}$  drop of hanger, will list at \$55. Their '99 advance catalogue will be sent to the trade in a few days.

O. C. Hutchinson, who for the past eighteen months has been in charge of the bicycle sales department for the Bean-Chamberlin Mfg. Co., of Hudson, Mich., has accepted a similar position with the Monarch Cycle Mfg. Co. of Chicago.

Andersen & Fuller of Christiania, Norway, are agents for bicycle parts for the whole of Scandinavia and Finland, where they travel regularly, and invite correspondence from manufacturers in this country.

A. Chaney, cycle dealer of Terre Haute, Ind., will go on the road as traveling salesman for the Grand Rapids Cycle Mfg. Co., and will push the Clipper chainless, as a leader.

#### TRADE NOTES.

V. E. Ripper, proprietor of Ripper Cycle Co. of Buffalo, N. Y., manufacturers of the Electric City and Ripper bicycles, has leased the factory and salesroom of Iroquois Cycle Co. of the same city, and will continue the manufacture of the Mohawk and Cayuga bicycles, which was given up some time ago by the Iroquois Cycle Co. The latter concern, is not connected with Iroquois Cycle Works of Chicago, which makes the Iroquois bicycles.

W. H. Burt of the Burt Cycle House, Wichita, Kas., has arranged with Manson Cycle Co. of Chicago to manage the southwestern business of that concern and make his Wichita store the distributing depot for Kansas, Texas, Oklahoma, Colorado and New Mexico. Mr. Burt is also enlarging his business by the addition of sewing machines, pianos, organs and vehicles of all kinds.

J. E. Sellers, formerly in business at 1009 Grand avenue, Kansas City, Mo., under the style of J. E. Sellers Cycle & Supply Co., has opened a new store under the same name at 1221 McGee street, same city, and the old business and location is retained by U. M. Sellers Cycle Co.

A few samples of an improved double cylinder bicycle pump are being made at C. F. Pennock's factory in Chittanooga, N. Y., and if the pump is the success it is expected to be, they will probably be manufactured there on a commercial scale.

E. H. Allen, the pioneer exclusive bicycle dealer of Waterbury, Conn., and the foremost Spalding agent in Connecticut, has just moved into a handsomely equipped and decorated store and has added sporting goods to his line.

A. S. Ewing, conducting a manufacturing establishment in Chillicothe, O., will add a new department to his factory and begin the manufacture of bicycles the coming winter. G. A. Vincent will have charge of this department.

Defiance Wheel Co. has been incorporated with \$10,000 capital to manufacture bicycles and other articles at Defiance, O. The incorporators are A. H. Wood, John Spangler, E. P. Hooker, D. D. Lovridge and E. T. Clark.

Coe Mfg. Co. of 50 Warren street, New York, has arranged with Hartley & Graham of New York City, for the latter firm to control the export trade for the entire Coe line during the coming season.

The American Cycle Co. of Chicago is about to move to Akron, O., and will occupy the works of the old J. F. Seiberling

Mower & Reaper Co., which have been idle for several years. The assignee of the latter company has made an application to the court asking for authority to lease the buildings. The company will equip the plant with the best machinery, and expects to employ several hundred men.

Hine-Watt Mfg. Co. of Chicago has been incorporated with capital stock of \$50,000 to manufacture hardware and bicycle sundries. Incorporators are, Lucius A. Hine, Sern P. Watt, Jos. T. Burnham, Jr., and Ernest W. Hicks.

Marion Black, successor to Black & Peltier, bicycle dealers, of Ft. Wayne, Ind., has consolidated with the Meyers Cycle Co. and formed the new firm, Meyers & Black.

American Tin Plate Co. of Richmond, Ind., emphatically denies the press statements that it is about to erect a new factory and engage in the manufacture of bicycles.

Hicks Motorcycle Co. of Chicago has been incorporated by John A. Drake, Belle W. Barry, and Frank W. Howser, with \$2,500 capital, to manufacture motor vehicles.

The Colorado Cycle Supply Co. of Denver has removed to 1645 California street in that city, with a view to providing increased facilities and space for sidelines.

Wesley P. Churchill Co. of Cambridge, Mass., has been incorporated with \$10,000 capital stock to manufacture bicycles and motor carriages.

F. E. Bundy Mfg. Co. of Elmira, N. Y., has been incorporated as The Frank E. Bundy Lamp Co., with capital stock of \$10,000.

The property of State of Maine Wood Rim Co. of West Paris, Me., is in possession of trustees under first mortgage bonds.

Fobes Bros. & Niles, incorporated, of Seattle, Wash., dealing in bicycles, have arranged to dissolve corporation.

H. Mark, of Moorehead, Minn., dealing in hardware and bicycles, will go out of business January 1.

Hitchcock Lamp Co. of Watertown, N. Y., has changed its name to Jefferson Brass Works.

Frontenac Cycle Co. of Philadelphia, Pa., has been succeeded by Magee & Young.

Henry T. Bragg, manufacturer of bicycles in New York City, has assigned.

#### FEATHERSTONE & CO.'S MODELS.

Eight Comprise the '99 Line—List From \$50 to \$25—Distinctive New Features.

The new models which A. Featherstone & Co. of Chicago are preparing to place in the hands of agents are now ready for inspection and will be shown to the trade as rapidly as the company's force of travelling men can cover the territory. They are all to be known as "Featherstone" models and are designated A, B, C, D, E, F, G and H, ranging in price from \$50 to \$25. Among the most conspicuous new features of the line is the regular equipment with

Featherstone detachable tires of the G. & J. pattern with option of Hartford single tube tires, and in the cheaper models a price reduction if tires of lower grade are chosen. A new reversible handlebar of the company's own pattern and manufacture gives the front part of the best models a very attractive and individual appearance. The expander device for fastening the stem is covered from view with a cap as shown in the accompanying illustration. The seat post fastening is of equally neat design, and the crank shaft mechanism is entirely new in construction, readily taken apart and set

up. It is of the "divided" pattern, the junction of the two shaft sections being effected by a "square taper" fit which is locked and unlocked by means of a key. The connection is secured by a screwthreaded locking plug, which is operated by the same key from the left hand side of the machine. The plug fills the bore of the left crank boss and crank shaft section and the mechanism is so arranged that the taper junction cannot be undone by any means, except by the key, thereby securing workmanlike operation by even the most careless rider and permanent satisfaction to riders, dealers and manufacturer. Wheel rims are eyeleted for passage of the spokes. One of the models is equipped with 30-inch wheels, and the company has taken especial care to make the short head and the fork stem doubly strong, and to make the ball cups of especially tough material and accurate workmanship. In the following are given some of the principal points covered by the specifications:

Model A.—  
Weight: 26½ pounds. Frame: Shelby seamless steel tubing; depth, 23 inches; main tubes, 1¼ inches; upper rear fork tubes, ¾-inch; lower rear fork tubes, ⅝-inch "D"

tubing, tapered; head, 4¼x1½ inches; drop, 3½ inches; narrow tread; large barrel crank hanger; flush joints throughout; nickel plated covers of rear fork ends. Steering fork: Drop forged, arched crown; 1-inch seamless fork sides; crown and fork ends nicked. Wheels: 30-inch; wood rims, enameled to match color of frame; striped; large patent hubs; swaged tangent nicked spokes, tied at intersection; 32 spokes to front, 36 spokes to rear wheel; 1½-inch Featherstone (G. & J.) detachable tires. Handlebar: Ram's horn pattern; medium drop; reversible; 1-inch, tapered to ¾-inch; seamless. Bearings: Tool steel, oil tempered and removable; equipped with combination oiling and ball retaining device, conducting oil direct to bearings. Pedals: Combination rat trap and rubber; convertible; Featherstone make. Cranks: Semi-oval; drop forged; 7-inch. Chain: 3-16-inch; B block; polished; one-piece chain adjuster, front screw. Gear: 80 inches; clover leaf pattern front sprocket 24 teeth; rear sprocket 9 teeth—both detachable and reversible. Finish: Enameled in black, maroon and olive green, artistically striped; all bright parts nicked. Options: 25-inch frame. Gear, 72 and 93 1-3. T seat post. 6½-inch cranks. 1-½-inch Hartford single tube tires. Handlebar, seamless; steel; 1-inch, tapered to ¾-inch; reversible; medium drop or upturned, and reversible racing, special design.

Model B, Racer.—Weight: 22 pounds. Frame: Depth, 21 inches. Wheels: 28-inch; wood rims, enameled in royal blue, striped. Handlebar: Racing low drop; reversible; special design; 1-inch, tapered to ¾-inch; seamless. Gear: 91 inches; clover leaf pattern front sprocket 26 teeth; rear sprocket 8 teeth; both detachable and reversible. Finish: Enameled in royal blue, artistically striped; all bright parts nicked. Options: On gear, crank length, tires, saddles and handlebar.

Model C, Roadster.—Weight: 25 pounds. Frame: Depth, 23 inches; head, 6¼x1½ inches; drop, 2¼ inches; flush joints throughout.

Model D, Women's.—Weight 26 pounds. Frame: Depth, 22 inches; with options of 19 inches and 24 inches. Handlebars: Reversible upturned, equipped with brake; 1-inch, tapered to ¾-inch; seamless. Pedals: Screw into cranks; made from cold rolled sheet steel and steel drop forgings; moulded rubbers. Gear: 67 1-5 inches; with options 68 4-9 and 74 2-3. Guards: Enameled wood chain guard and rear mud guard only; finely striped; laced with cord to match finish.

Models E and F are men's and women's roadsters, weighing 26 and 27 pounds. Models G and H are juvenile machines for boys and girls.

Imports of bicycles to Italy in 1897 numbered 1,994, of which 810 were American made, 538 English, 337 French and 309 German. In the same year Italy exported 1,036 machines, to Egypt, Switzerland, Japan, Austria and Brazil. In 1896 Italy did not export 50 bicycles.

**QUALITY AND PRICE.**

Columbia bicycles have been for many years the standard of the world, unequalled, unapproached. Although the price has been so greatly reduced, the quality is and always will be the best that human ingenuity can make. How often you hear the remark: "As good as a Columbia," or, "I would have purchased a Columbia, but I got this at a discount." The price is now within the reach of every one who wants the best. No matter how much higher a bicycle is listed, it cannot be sold for more than the price of a Columbia. They are always sold at the list price, and everybody knows that the one price is always the lowest. The great bulk of the people prefer to purchase in stores where goods are sold at one price and where all are treated alike. When any article is listed above its value, it is sold at a cut price and at different prices to different customers, so that no one knows whether he buys at the bottom price or not.

The Pope Company believe, with these new prices, that they give the most for the money that has ever been offered, and yet have not sacrificed quality. Columbia, when applied to a bicycle, means, and always will mean, the best that can be made. The Pope Company challenge the world to produce better bicycles and do not believe that their equals exist.

Hartford bicycles stand next to Columbias, are equal to nearly any other bicycles and superior to most of them. If you cannot have the Columbia trade mark, have the Hartford; both are guaranteed.

The bevel-gear chainless is one of the greatest improvements in bicycle construction, and they advise everyone who can afford to pay \$75, not to purchase any other until he has tried the chainless and satisfied himself of its merits. You never hear any one who has ridden the Columbia chainless say anything against it. Those who criticise are the manufacturers who do not make them and the people who have never ridden them. Their testimony, of course, is of no value. The valuable testimony comes from the one who has had experience with it. Ask any rider who has ridden a Columbia chainless one hundred miles, and see whether he will give it up or not.

The wise buyer will see the Columbia and Hartford line before investing his money in a bicycle.

**Charles Francis Adams' Opinion of the Columbia Bevel-Gear Chainless Bicycle.**

ADAMS BUILDING, 23 COURT ST.,  
BOSTON, October 29, 1898

MY DEAR COLONEL POPE:  
I got back from Europe from my bicycling trip in Holland, up the Rhine and in England nearly a month ago. I have been proposing to myself to write to you on the performance of the wheel you recommended me to buy, but absence from home and pressure of business have prevented my so doing.

I now wish to say that my wheel fulfilled all you promised in regard to it. I found it an admirable machine. I rode in all 800 miles, a large proportion of it over paved roads; and I am a very clumsy and heavy rider. The wheel gave me no trouble whatever, and I did not find it necessary even to oil it. My only disaster was a punctured tire due to picking up a tack in the roadway in Holland. This was soon repaired. Otherwise the wheel stood a very severe wear-and-tear with a success that surprised me.

I also found it a much better machine for hill-climbing than any I had ever had before. In fact its purchase by me on your recommendation proved in every way satisfactory, and the excellence of the machine added immensely to the pleasure and sense of security of my trip. I ceased to be continually anxious lest some disaster should happen to my wheel.

Under these circumstances, I wish to put in your hands this recognition of the wisdom of your advice to me.

I remain, etc.,  
(Signed) CHARLES F. ADAMS.

COL. A. A. POPE,  
223 Columbus Avenue, Boston.

**Be You Rider or Dealer**

**Don't Fail to See Our 1899 Models.**

On Nov. 15th we expect to express to all our Branch Stores sample models of 1899 Columbias, Hartfords and Vedettes.....

We invite every rider in the various cities in which our Branch Stores are located to call and examine our line. We want every Dealer to go to see our Branch House Manager in his territory, and have a talk with him about our policy and prices and look over the new Models. They are the handsomest and best machines we have ever built and we do not believe their equals exist.

At the new prices the dealer who secures the Columbia Agency cannot fail to do the bulk of the bicycle business in his territory, if he makes proper use of his opportunities.

# THE PASTIME AND SPORT

### Michael Sails for Europe.

New York City, Nov. 14.—Jimmy Michael and his new mentor and confidential friend sailed on a French line steamer last Saturday for a brief pleasure tour abroad. Michael expects to make a short stay in Paris and then go to visit his family at Aberaman, Wales. He will stay abroad but a little while and may return in time to give some exhibitions behind motor pace during the week of the six-day race, which begins at Madison Square Garden on Monday, December 5. Jimmy still has the jockey bee in his

Boston Meet Club is making special efforts to boom Montreal, as it is proposed to run the L. A. W. championships immediately following. Montreal city council will give a good grant for entertaining visitors. It is proposed to bring from Europe several of the fastest men that can be obtained, and to get some pacing machines from France. The Queen's Park Track, where the races will be held, is well lighted for night races, and it is proposed to put on special attractions for each night. The hotels and railroads are taking the matter up. Special excursion

### Belated Amateur Meet.

New York City, Nov. 14.—A well attended amateur race meet was run off on election day at the Parkville Driving Park, one of the few available tracks in Greater New York which are not under L. A. W. suspension. The main feature of the meet was an hour paced race between Charles Earl, of Brooklyn, and Adolph Michael, of Jersey City. The K. C. W. man had quints and far better pace than the Jersey man, who was confined to triplets. Earl won by about two miles, doing 27 miles, 1560 yards, in the

bonnet and is thinking more of making his debut in the saddle than of kicking the pedals next year. There is even a chance that he may ride horses at New Orleans or in California the coming winter.

### Arranging for International Meet.

Montreal, Nov. 14.—The World's Meet Committee is hard at work getting into line for the championships in 1899. It has been decided to make the evening of November 28 a cyclists' night, when all the bicycle clubs will unite in general festivities. Lord Minto, the new Governor General, will be asked to accept the patronage of the meet. Mayor Prefontaine accepted the honorary presidency and is very enthusiastic over the meet. The

rates will be given from Pacific coast points and already cyclists' parties are being formed on the coast to attend the international meet in a body.

### Elliott Elected by Big Plurality.

Springfield, Mass., Nov. 14.—Sterling Elliott received 3,222 votes out of 3,956 at the annual election of the Massachusetts division L. A. W. Dr. A. A. Bryson, of Fall River, was elected vice-consul and Aaron Wolfson, of Dorchester, secretary-treasurer. Wolfson had but eight majority over Arthur K. Peck, who ran on an independent nomination, the vote standing: Wolfson, 1,724; Peck, 1,716. The election committee claims that it recounted the votes and that there can be no doubt concerning Wolfson's election.

hour, the amateur record being 29 miles, 846 yards, held by John Nelson, of Chicago. An interesting contest was at half-mile heats between Charley Murphy and the unguided pacing horse, Neil Alcyoner, which the professional cyclist won in straight heats. Collett and Hausman had a pretty fight at the finish of the two-mile handicap. Summaries:

- Quad pursuit race, three miles limit: Tollner, Hurly, Lott and Doyle, first; Malcher, Bechman, Haviland and Donnelly, second. Time, 7:10.
- One-mile amateur championship of Brooklyn, final heat: W. P. Kutchen, first; A. G. Relyea, second; F. Moller, third. Time, 2:22 2-5.
- Cycler vs. horse, half-mile heats: C. M. Murphy, cyclist, first; Neil Alcyoner, pacing horse, second. Won in straight heats, times 1:12 4-5 and 1:07.
- Two-mile handicap: E. C. Hausman,

scratch, first; G. H. Collett, scratch, second; J. F. Rogers, 125 yards, third. Time, 4:47 2-5. One-hour paced race: Charles T. Earl, first; Adolph Michael, second. Distance, 27m., 1,560 yds.

### FRENCH MOTORCYCLE RACES

**Two-Days' Meet at Lille Draws Select Attendance—Femine Motorcyclists Participate.**

The first big motor bicycle race meet ever held took place at Lille, France, on October 31 and November 1. There was a fair attendance of the most select persons of the city. The final of the 2,000-meter amateur championship was won by Lamon, with Madame Accou, who is an expert motorcyclist, second, and Pallet, third. Time, 4:19. The professional championship was run in three heats and a final, and was won by Courbe in 5:47, with Marcellin second and E. Accou, third. A tandem motorcycle match at six kilometers, between "mixed" teams—male and female riders—was won by Dutrieux and his sister, Mlle. Dutrieux, defeating Courbe and Mme. Accou in two straight heats, covering the distance in 6:56 4-5 and 7:08 1-5, respectively. In a 50-kilometer match Marcellin defeated Osmont by a quarter of a mile in 1:06:07 4-5.

On the second day a 4,000 meter motorcycle race was run in three heats and a consolation to qualify. Courbe won the final in 7:42 2-5 by five inches from A. Accou, second, and S. Accou, third. On the first turn Dutrieux and S. Accou collided and damaged both machines, but Accou secured another machine and finished third.

### WALTERS THE VICTOR

**Wins Fifty-Mile Paced Race from Bouhours, Bourotte and Simart—Armstrong Bakes Himself.**

Paris, Nov. 4.—The fifty-mile race, with pacemakers, at the Parc des Princes Velodrome last Sunday, resulted in favor of the English competitor, Walters, who easily defeated Bouhours by 500 meters, while Simart and Bourotte were respectively six and eight laps behind. Armstrong, the other British representative, led to the thirteenth kilometer at a killing pace, but nine kilometers later had to drop back, being thoroughly exhausted. He did yeoman service, however, for his fellow countryman, as long before the finish the Frenchmen were "baked" and Walters won just as he pleased, his time for the whole distance being 1:37:11 2-5. Walters, Armstrong and Bouhours were paced by two electric tandems, while Simart and Bourotte were paced by petroleum tandems. The scratch contest, in heats of 1,000 meters, went to Carmant, who defeated Nieuport, Bourotte and Boulay. Despite the fine weather there was but a moderate attendance, and the general opinion of those present was that long distance contests are a mistake so late in the season.

### Abandonment Sentiment Growing.

As the time approaches for the National assembly the likelihood of the prevailing sentiment being in favor of the relinquishment of the control of racing by the League increases, and the chances of racing officials, handicappers and others pecuniarily and politically interested in the retention of race control being able to persuade the L. A. W. to hold on and make a fight diminishes. Chief Consul Belding and Vice-Consul Fullerton, of the New York division, are among the many who believe that the L. A. W. will be better off unhampered by race government, and they may head a unanimous delegation from the Empire state to vote for the abandonment of racing control, unless Potter can rally the delegation

to the support of his friend Mott and chooses to perpetuate race control that he may continue to have handicapperships and other racing offices at command for purposes of political reward and punishment. With Belding, of New York, Elliott, of Massachusetts, and Collins, of Pennsylvania, open advocates of racing abandonment, there is a powerful nucleus for anti-racing sentiment at the National assembly.

### MILE IN 1:32 FLAT

**Taylor Secures the World's Record Under Adverse Conditions—Half and Third Also Broken.**

Philadelphia, Nov. 14.—Last Saturday, at the end of a windy, rainy week, Major Taylor was enabled to wrest from Edouard Taylore, the coveted mile record. The weather was cold and raw, ice having formed at the track during the night, but when, shortly after 3 o'clock, the brisk northwest wind partially died down, Taylor's manager decided to make the first attempt at the mile. The preliminary warm-up over, the dusky flyer was sent away behind the Crooks quint. The first third was done in :29 1-5. A marvelous pick-up by the Sager quint team, followed by a somewhat slower third, landed the major at the two-thirds pole in 1:00 3-5. When the Callahan team came in to make the pick-up they started too soon and Taylor had to sprint past the Sager quint and close a five-yard gap to catch the Callahan quint going at full speed. With Manager Ward yelling offers of extra pay, they carried the Major the last third in :29 2-5, and as his front tire crossed the tape all the official watches recorded 1:32 flat, three-fifths of a second under the world's best previous time.

After a very brief rest the black wonder went for the half-mile record behind the quint mounted by Crooks, Fisher, Echberg, Cleeland and Newhouse, who carried him all the way because the Callahan team failed to pick him up on the bank. The time for the half was :45 4-5, breaking the record of :48, allowed to Willie Windle by the League, although Johnny Johnson claims :44 1-5, made at Nashville in October of '96. Not satisfied with this time, Taylor went for the half again behind Callahan and Sager teams. There was some confusion in the pacing, causing Major to swing wide, but he cut one-fifth of a second from his previous time, putting the figures at :45 3-5.

Today the coming American champion officially added the third-mile record to his slate, by tying his best previous time of :29 4-5, made in his first third in the successful mile record ride Saturday. This breaks the record of :30 3-5 made by E. Taylore at Willow Grove, August 6 last.

Next week Taylor will try to put the mile figures at 1:30 flat, and may go for the five-mile record also. The machine he is riding is an Orient, fitted with the Sager roller-pin gear.

Some idea of the expense of securing world's records may be had from the statement that the weekly salary list of Taylor and his assistants totals close to \$800, besides which the Major and his pacemakers come in for bonuses for each world's record captured—the colored wonder pocketed \$500 extra for the mile and \$100 extra for each of the others; so that his stay in this city has cost his employers up to date but little short of \$3,500.

In the early part of the week Taylor had to suspend his efforts owing to the fact that the tires on his quintuplets were coming loose, and he had to telegraph to Boston for the only expert who can attach these large tires to big pacing machines so that they will not creep and cut off the valve. The explanation offered for this loosening is that the heat developed

within the tires by the rapid motion under nearly half a ton weight, softens the cement, which is then thrown off in fine threads by the centrifugal force, and the tires, thus freed, slip along the rims.

### JACQUELIN WINS IN ITALY

**Defeats Protin at Turin by Inches at the Tape—Banker Third in Tandem Race.**

The final of the Grand Prize race run on the third day of the Turin meet, October 30, was one of the finest races ever given on the Umberta track in Italy. In the first semi-final, Meyers won after a splendid fight by inches from Jacquelin, Eros and Bixio finishing in third and fourth places, respectively. In the second semi-final Singrosso defeated Protin by half a wheel, and Broca and Momo secured third and fourth places.

Protin (Belgian), Meyers (Dutch), Jacquelin (French), and Singrossi (Italian), started in the final, changing pace at every lap until the bell, when the order was: Meyers, Jacquelin, Singrossi, Protin. Entering the last turn, Protin began his sprint, but Jacquelin followed, and coming down the home stretch gradually, worked up in front. Less than ten yards from the tape the plucky Belgian was still ahead, but in a last tremendous effort Jacquelin passed Protin and won by a small margin. Meyers was third and Singrossi last.

The tandem race was won by Ferrari-Bixio, with Eros-Cesotte second and Banker-Grogna third. Tomaselli won the consolation race from Yaap Eden and Magli.

### Will Wait Till He is Champion.

Taylor, when interrogated at Woodside park concerning the European trip which it has been reported he will take next season, said: "Unless it be as champion of America, I shall never race on the other side. I realize now that I abandoned all my championship prospects when I left the outlaw circuit just before the Cape Girardeau meet. But I couldn't stand the treatment there; however, there's no use crying over spilled milk. When I joined the outlaws it was in good faith, and with the firm belief that could I but win the championship from such an aggregation of first-raters, no one could question my title. Had I remained with the L. A. W. and raced here and at Baltimore and New Haven I would surely have gained the top of the ladder; but just as everybody is now laughing at the notion of Tom Butler being the national champion, so they would have laughed had I won the title against mediocre men—and I couldn't stand that. While I have a number of claims on the '98 championship they do not make me the champion. With one exception I have beaten every white racing man oftener than he has beaten me, and my percentage in the championship and in general competition is better than that of any other one man."

### NEWS IN BRIEF.

The new chief-consul of the New York division L. A. W., M. M. Belding, will strive to boom his division membership and regain the leadership now seemingly lost to Pennsylvania. Local organizations are to be established in each town and district where membership warrants it, and these will be kept in close touch with the division "cabinet," which will comprise the heads of all departments of state work, who will meet frequently to discuss plans with the chief-consul.

New York City, Nov. 12.—A cable was received today at the offices of the American Cycle Racing Association, notifying them that James C. Kennedy sailed from Southampton on the St. Paul for this country, having signed five riders for the New York six-day race out of many foreign cracks

# Barnes Bicycles

THE pathway of the retailer is generally a hubby one, but the THINKING, FAR-SIGHTED dealer has the easiest time of it and makes the most money simply because he selects a line of wheels which require no talk to convince people of their superiority, and which having been ridden prove to be even better than they look.

The Barnes line for 1899 is LONG on looks, and still LONGER on reliability. It is the catch of the year for any agent.

All you can lose is a two-cent stamp by registering your application with us for the agency, then if the samples are not up to our talk, don't close. The White Flyer line has usually made a hit. For next year it promises to make several hits.

who were anxious to be included in the number. Besides the quintet of long distance men, Mr. Kennedy arranged with several of the foreign short distance men to come to this country. It is probable that the short races at Madison Square garden this winter will be as cosmopolitan in aspect as the six-day affair. On the St. Paul with Kennedy are Frederick, Joyeux, and Teddy Hale. Stephane and O'Halloran will sail on a later steamer.

"The first meeting of the A. R. C. U. was held in Bald's room in a hotel at Philadelphia. All were invited to be present," said Owen Kimple, after his return home from the circuit. "Bald was made chairman. The discussion got warm, and all of us took part. Cooper, who had not spoken to Bald for several years, dugested around on the edge of a bed, where he was sitting, and finally could contain himself no longer. He blurted out: 'Now, Eddie, it's this way, and we all know it.' Bald looked at him coldly, turned red, and started to say something about addressing the chair respectfully; then he changed his mind and said pleasantly: 'Yes, Tom, that's so.' The hatred of years was wiped out, and the two rivals have been on good terms ever since."

The "bicycle hazard" in life insurance appears to have been largely overrated, judging from recent reports of several insurance companies. One reports having paid accident losses aggregating \$100,000 during the years 1893 to 1896, inclusive, to claimants injured while using the horse, and \$250,000 to persons injured by fire-arms, while during the same period only \$60,000 was paid to injured cyclists. An expert insurance man also states that bicycle accidents seldom disable a man for more than a few weeks, while in case of horse accidents the full weekly indemnity usually has to be paid during a long period.

A Peoria, Ill., wheeman voiced a feeling entertained by most old-time cyclists, when he said recently: "A great change has come over the sport. The wheel has become a common article of everyday use, and the days of clubs, runs and special wheel literature are about over. The low prices are bringing out a new lot of riders every year, while some of the old ones get tired and drop out. In a short time the bicycle will settle down to its real place as a comfort and convenience. People will use it because it saves them time and strength, and not because it is the prevailing fad."

McDuffee's manager, C. R. Culver, writes from Atlanta, Ga., where his charge is training and racing, that McDuffee does not intend to go for paced records in Jacksonville or any other place this winter. He is seeking a match race with any rider in the world for a suitable purse, and if he cannot arrange one within the next three or four weeks, will go to Italy about December 15, a good proposition having been received from parties there.

The official programme for the Olympian games to be held during the international exposition at Paris in 1900 has just been published. Among the committee having the arrangement of the sports in charge is W. M. Sloane, of New York. The bicycle events include an unpaced scratch race of 2,000 meters, tandem scratch race of 3,000 meters, and a paced race of 100 kilometers in which motor pacing will not be allowed.

A comparison between Elkes' hour record made at Willow Grove, August 6, behind human pacing, and Huret's trial, behind petroleum tandems with wind shields, made at Paris early in October, shows that the Saratoga lad covered the equivalent of 55 kilometers, 331 meters, as against the Frenchman's 52 kilometers, 333 meters, a difference of 2 miles and about 300 yards.

Brazil has at present nine bicycle tracks and three more are under construction. The last are all cement, and of the nine others four are cement, two cinder, two macadam and one brick. At two of the tracks, races are held at night by electric light, while some of the others are lighted by coal and acetylene gas. Big meets are held on Sundays and holidays.

Peoria Bicycle Club of Peoria, Ill., is divided against itself on the question of League membership and whether the \$300 yearly L. A. W. dues of its members shall be paid into the League treasury by the club or by individual members. Most of the club members wish to remain in the League, but object to the heavy tax on the club funds.

The Thanksgiving night races at Madison Square Garden have been abandoned, owing to the impossibility of putting in the track in the short time allowed by the other Garden engagements. The first indoor meet will therefore not be held until December 3, the Saturday evening preceding the start of the long grind.

The riders' syndicate of Paris, which holds a somewhat similar relation to the racing af-

fairs in France that the A. R. C. U. does in this country, cleared more than \$900 on its recent big race meet in Paris. The expenses, including \$1,500 for prize medals, aggregated \$1,399, while the receipts were \$2,310.

A state bicycle path is being built from the south line of Michigan to Straits of Mackinac. Funds for the purpose are secured from cyclists by the chain letter system and contributions are being received from all parts of the country by the State Bicycle Path Association at the rate of \$100 per day in sums of from ten cents to one dollar. Work has been begun in the vicinity of St. Johns and is progressing nicely.

According to the New York Evening Journal, there is a scheme on foot to form a new body for the purpose of controlling amateur cycle racing. The projectors are as silent as the proverbial bivalve, it is said, because they are awaiting the action of the National assembly. It is more probable that the Journal has overstrained its ears to catch the rumor and now finds nothing to substantiate its statement.

Tom Cooper is credited with having become more wealthy by his racing career than any other cyclist in the world. He was the principal owner of a paying concern in Detroit which recently sold to an English syndicate for \$12,000, and he now holds stock in a telephone company that pays him 187 per cent dividend. In 1893 he was clerking in a drygoods store for \$5 a week.

Fred Schinneer is hard at work in Chicago climbing the stairs of the Masonic temple many times a day from bottom to top, and running backwards for miles to strengthen the muscles of his legs. This is his unique method of training for the coming six-day grind in New York.

Smith N. Fowler of Chicago is arranging a winter cycle racing trip for a few chosen first class men to Bermuda Islands for several months, Florida for a month, and probably Cuba. The start will be delayed until the middle of January, when the Madison Square Garden races are over.

Pennsylvania will probably put a candidate in the field for the League presidential race in the person of T. J. Keenan, now first vice-president of the League. If he cannot make it, a combination on Kireker, of New Jersey, will be the logical outcome.

The draft of the constitution and by-laws of the new racing association has been completed and will be submitted at a convention of track owners and race promoting clubs, to be held in New York during the six-day race meet.

The season's winnings of German riders are given as follows in a foreign exchange: Arend, \$4,431; Verheyen, \$1,731; Breiting, \$1,067; Koecher, \$1,056; Mundner, \$1,049; J. Fisher, \$1,003, and August Lehr, \$316.

Pennsylvania now leads in L. A. W. membership, having passed New York last week. Secretary Bassett's last official report shows the Keystone State to have 115 more League members than the Empire State.

Heydon and Thackwaite of England placed the world's hour amateur tandem figures at 29 miles, 1,110 yards at the Crystal Palace on November 1, lowering the former record by 332 yards.

Tom Eck takes exception to some of the personal statements made against him by Chairman Mott in one of his recent bulletins, and there are hints of another libel suit.

Nat Butler will enter middle distance racing Thanksgiving day, when he meets Harry Elkes at Troy, N. Y., in a match race on an eleven-lap indoor track for a purse of \$1,000.

Sager, who steers one of Taylor's quints, will try for all unpaced records from ten to fifty miles at Woodside Park track, during the present week.

Collett and Hausman, the fast Connecticut amateurs, contemplate opening a retail cycle store this winter.

## MISCELLANEOUS.

Advertisements under this head 5 cents per word first insertion, 3 cents per word each insertion thereafter. Cash with order. Express orders, postoffice orders, or stamps received.

### WANTED

**WANTED**—Pacific Coast traveler desires position with bicycle house placing agencies this winter. Address LOGAN CYCLE Co., Hollister Cal. 1

**WANTED**—Position; twelve years with bicycle firm who are going out of business. Address. M. A. C., care Cycle Age.

**WANTED**—To furnish some reliable jobber with bicycle cements, enamel, polish, chain graphite and lubricating oil for next season. Send in your contracts. LOUIS E. DETTMAN CYCLE Co., Marinette, Wis.

**WANTED**—Position with reliable sundry and bicycle fittings house; indoor or on road; twelve years' experience; competent to take full charge of business; thoroughly acquainted with and control large amount of trade; now employed but wish to make a change. Address CYCLE, care Cycle Age.

**WANTED**—Salesman to carry a special bicycle saddle on commission as a side line. This saddle will be extensively advertised and is an easy seller. WM. B. RILEY & Co., 324 Market St., Philadelphia, Pa.

### Mail us your Subscription.

**WANTED**—Manufacturers' agent to handle a good line in Chicago and vicinity; prices such that large trade can be sold; address with references, S. E. G., 35 Warren St., New York City.

**WANTED**—Position as foreman of assembling room; ten years' experience; best references. Address, ASSEMBLING, care Cycle Age.

**WANTED**—Agents throughout the United States and Europe to sell the Best Double Roller Chain on the market; large commission; every chain warranted. THE ETNA HARDWARE Co., Unionville, Connecticut. \*

**WANTED**—Old bicycle tires and scrap rubber. How much have you? THE TREMONT RUBBER COMPANY, New York City.

### FOR SALE

**FOR SALE**—Punnett Companion, A1 condition, for sale cheap or will exchange for '99 wheels. L., care Cycle Age.

**FOR SALE**—One Fox Machine Co's gas brazer complete, at a bargain. THE CARLISLE MFG. Co., cor. Clinton and Jackson Sts., Chicago, Ill.

**CHAINLESS BICYCLE**, straight gear, easily changed, light weight, low cost, hill climber. Will either sell patent, place on royalty or arrange with capitalist to manufacture. Perfect working model, thoroughly tested. Photograph at Cycle Age office. Address R. F. BARTEL, Bayonne, New Jersey.

## AND TRADE REVIEW

VOL. XXII—No. 4.

CHICAGO, NOVEMBER 24, 1898.

NEW SERIES No. 53.

### OUR CANADIAN TRADE GROWS LARGER RECIPROCITY NEEDED

Comparative Statistics Show That for Five Years Past England Has Been Losing Ground.

The course of the general trade of the United States with Canada has for some years been one of expansion. Variations in its amount have occurred, owing to tariff changes and the lower or higher capacity of the Canadian people to purchase foreign goods, but these variations have been only temporary in their effect when they restricted the imports into Canada of goods from the United States. It is more convenient for Canadians to purchase in the United States than from any other country; but to obtain their custom to the fullest extent, they must be allowed to enter their products into our markets without excessive duty. By a larger reciprocity the United States would be greatly the gainer.

#### Shrinkage in Cycle Imports.

That our cycle, parts and sundry makers have not of late obtained their share of the benefits arising from this general expansion of trade between the two countries is not strange when pause is made to consider the growing condition of the bicycle industry in the Dominion, the activity of its makers and the striking similarity between the products of their factories and ours. The Canadian agents, however, are yet firm friends of our makers, a statement fully supported by the figures contained in the following table, which presents the volume of cycle exports to Canada for the eight months ending with August, 1896, 1897, and 1898, in comparison:

1896	\$492,123
1897	672,036
1898	541,674

#### England Losing Her Hold.

A comparison of the statistics of imports of manufactured goods from the United States into Canada, from 1893 to the close of the last fiscal year, ending June 30, 1898, with the statistics of imports from Great Britain into Canada for the same period, shows with striking clearness the fact that the United States has been gradually but steadily capturing more and more of this trade, while Great Britain during the same period has been losing its hold. It is the opinion of importers of such goods from the United States as come more or less into competition with those from Great Britain, that the discrimination in favor of British goods of a 25 per cent reduction in duty will have only a trifling effect, if any at all, upon the volume of imports from the United States.

Canadian consumers of the leading articles made of iron or steel, or a com-

bination of them, and of other metallic goods, show such a decided preference for those goods made in the United States that they will not take British goods, even if the preferential duty cause them to be proportionately lower in price. At the same time, they consider it would be well for United States manufacturers to avoid presuming upon the advantage they have acquired, by indifference to the quality of the goods they send to Canada, by less careful packing, or by neglecting to keep in close and constant touch with importers, whose ideas as to local tastes and requirements should be carefully studied and as far as possible met.

#### Danger Lurks in the Tariff.

Although the present tariff in favor of British goods is not sufficient to change the current of trade, to any marked extent, from the United States to Great Britain, a much greater reduction of the duty on British goods might have some effect in that direction, especially if British manufacturers awoke to the necessity of catering more skillfully to the needs of the Canadian consumers. The possibility of such changed conditions arising needs to be considered by United States manufacturers, who will show wisdom in preparing to meet a more active competition from British-made goods, that may arise in the future. The more thoroughly we satisfy the Canadian importers in quality, price, terms, and other details, the more assured will be the prospect of our keeping and advancing our hold on the Canadian market.

#### Postage Rates May be Changed.

Canada is about to make an important change in her postage rates. After December 25 there will be three rates of postage on letters, viz., 2 cents for Great Britain and her colonies, 3 cents for Canada and the United States, and 5 cents for foreign countries. If the experiment proves satisfactory, the postmaster-general, it is understood, will then reduce letter postage in Canada and to the United States to 2 cents.

#### Old Bicycles Returned to England.

It is stated upon good authority that 3,000 English bicycles of 1897 pattern are on the way back from Australia, where they had been lying in bond.

### TO FIGHT "JUNK DEALERS" CASE CYCLE RETAILERS ASK HELP

Tradesmen Organize to Carry Tax Case Against Second-Hand Dealers to Higher Court.

Washington, Nov. 21.—The bicycle dealers who were recently arrested on the charge of conducting a second-hand business without the formality of having paid the license tax of \$40, have issued a circular to the merchants in various lines of trade who would be affected by such tax, inviting their cooperation in fighting the case. The circular says, in part: "It is the intention of those interested to fight this case in the Court of Appeals, but we do not intend to fight it ourselves and pay the costs of this case and let all others get the benefit. Our plan now is to take up a subscription of a small amount from each one and cover the costs in the Court of Appeals, and it will be only a small amount each one will have to stand; otherwise, we will let the case go by default, and we presume you would rather help out in this manner than be compelled to pay the tax of \$40 per year. We have every assurance from our attorneys that the decision of the police court will be reversed in the upper court."

#### Other Trades Affected.

The circular also sets forth the decision of the police court to the effect that all bicycle dealers who take old machines in part payment for new machines are liable to the tax, and concludes with the following extract from the Cycle Age of November 10: "The prosecuting attorney stated that should the Court of Appeals uphold the decision, it will mean an annual increase of about \$100,000 in the revenues of the district. A decision against the dealers, he said, will mean that all business men who take second-hand goods in part payment for new, and then dispose of the old goods, will be liable to a license tax of \$40. Dealers in bicycles, typewriters and harness will be among those who will be most affected."

#### Organize to Seek Aid.

Pursuant to a call, a meeting of the merchants who are likely to be affected if the decision of the lower court is sustained, was held Tuesday evening and temporary organization effected. Representatives of various trades were present and much interest was manifested. The following officers were elected: J. D. Lasley, chairman; John Woerner, Jr., secretary, and J. G. Taylor, treasurer. A finance committee, consisting of one member from each of the following trades, bicycles, stoves, carriages, harness, barbers' supplies, typewriters, sewing machines, pianos and organs, was elected, and the members were instructed to urge the dif-

ferent dealers in their respective trades to lend their aid in behalf of the movement.

The case of J. D. Lasley was thoroughly reviewed and it was unanimously agreed to carry the case to the higher court. Great stress is laid upon the fact that while dealers occasionally take in second-hand bicycles in part payment for new, yet this is only an incident to their general business, and in view of the fact that courts in other jurisdictions have held that such dealers are not liable to a tax as second-hand dealers, it is felt that the Court of Appeals must recognize the precedents established by other courts in similar cases.

Another meeting has been called and the case will then be put in shape to present to the higher court.

### MAIL FRAUD SUPPRESSED

Toledoan is Arrested for Using the Mails to Dispose of Toys Advertised as Bicycles.

Toledo, Nov. 21.—D. Frank Dreher, a well-known citizen of Toledo, has been bound over to the federal grand jury under \$500 bail, on complaint of the United States postoffice authorities, charged with using the mails in the furtherance of a scheme to defraud.

For a long time the "Monarch Cycle Company" has been receiving great quantities of mail. Lately there have been complaints to the postoffice authorities about the "Monarch" company, and the result was that Dreher was arrested in the act of taking letters from the "Monarch" postoffice box.

Dreher is accused of having sent thousands of circulars about the country in which the merits of the "Monarch high-grade cycle" were expatiated upon, the regular price of the machine being named as \$40, but offering in consideration of \$3.90 to send a fine model, providing the purchaser would give his word to "use his influence to sell three high-grade wheels at the regular price of \$40 each."

Just how many remittances of \$3.90 were received in response has not been learned, but some of the senders complained to Uncle Sam, for instead of receiving a rideable bicycle for the money invested they got nothing but miniature models, or mere toys.

When arraigned before United States Commissioner Brough, Dreher waived examination and he was bound over to the grand jury.

### Gains of English Makers.

In the following table, showing the profits or losses made by English cycle, parts and material houses during the past year, there is abundant evidence that the industry is still full of vitality. The figures are obtained from published company reports, which are made compulsory by law.

	Loss.	Profit.
Diamond Cycle Components Co. ....	\$ 8,000	
Ormonde Cycle Co. ....	39,000	
Alldays & Onions (bicycles)....	50,000	
Eadie Chain Co. ....	16,000	
Enfield Cycle Co. ....	47,000	
(a) Brooks & Co. (saddles)....	150,000	
Wearwell Cycle Co. ....	25,000	
(b) Eadie Mfg. Co. ....	47,000	
Simple Gear Case Syndicate....	8,000	
(c) New Premier Cycle Co. ....	248,000	
(d) Beau Ideal Cycle Co. ....	10 pc. div.	
(e) New Rapid Cycle Co. ....	\$70,000	
Cycle Mfrs. Tube Co. ....	38,000	
(f) Tubeless Tire Co. ....	93,000	

(a) The sum of \$75,000 was passed to reserve.

(b) The capital stock of this concern is \$700,000.

(c) A dividend of 5 per cent was declared, and \$100,000 was passed to reserve, making the reserve fund \$500,000.

(d) This concern is capitalized at \$150,000. A dividend of 6 per cent was also paid on preferred stock.

(e) This firm is capitalized at \$750,000. Its directors reported a complete collapse of the company's foreign trade.

(f) Of this loss \$50,000 is traceable to defective construction.

## THE DULL SEASON ELIMINATED

### EFFECT OF GROWING EXPORTS

#### Rapid Development of Our Foreign Trade Keeps Factories Busy the Year Around.

It has become one of the traditions of the bicycle trade that the late summer and fall months of each year constitute a "dull season" during which most of the factories are either shut down or manufacturing operations are practically suspended until productive activity reawakens about this time of year. But through the rapid development of our export trade this accepted belief, once true, has become one of the greatest fallacies of the industry. The demands of foreign countries now keep the wheels of the bicycle industry in almost constant motion from one year's end to the other, so that even the temporary shut-down of a week or a fortnight in mid-summer for repairs and inventory, though essential, becomes an unwelcome interruption.

#### Markets Always Open.

With the markets of the entire world open to our manufacturers and exporters, shipments can be made to some part of the globe during every month of the year, since in Australia, South Africa, South America and other countries in the southern temperate zone the riding season opens just when ours closes, and in tropical countries trade is open all the year around. Moreover, the purchases of American parts and materials by European countries, which have been growing at a most gratifying rate during the past year, provide the manufactories here with a branch of work that can be done during the once "dull months."

#### Recent Large Foreign Shipments.

Just now the export demand is very active. In the November 10 issue of Cycle Age mention was made of a shipment of 1,000 Snell bicycles to Malmo, Sweden, by the Snell Cycle Fittings company of Toledo. On November 12 the Stover Bicycle company of Freeport, Ill., shipped 600 Phoenix bicycles to Stockholm, Sweden. The Geneva Wheel company of Geneva, O., recently sent a shipment of 100 machines to the same place, and the Acme Cycle company of Elkhart, Ind., has just filled an order for 300 Acme bicycles for Stockholm and another order for Cape Town, South Africa.

The Peoria Rubber & Mfg. Co. of Peoria, Ill., has begun work upon large export orders, turning out 100 machines daily. Among a number of orders placed on November 11 by a New York export firm for a diversified list of articles to be shipped to London at an early date were orders for 650 first-class bicycles, and 900 hand pumps. A fortnight ago the W. R. Rollins Mfg. Co. of Harvard, Ill., made a large shipment of bicycles to London, and the Dudley Cycle Works of Menominee, Mich., filled an order for nipple grips for a dealer in Cape Town.

#### Hard Order to Fill.

An order was received last week by a New York export firm from Stockholm for 10,000 bicycles, but the conditions attached were almost impossible to fulfill. The price limit was a very low one, yet the importers wanted a year's guarantee with each machine, and the order called for deliveries at the rate of 1,500 per month.

A consignment of bicycle rims was shipped by a Winona, Minn., factory to Germany on November 12, and another order is being filled for the same country.

The Australian and the South African markets for cycles have been expanding rapidly of late and with the reduced

prices of American first-class bicycles there is good prospect of a large export trade with those countries during the coming season unless the prevailing prices of English machines are materially lowered.

About forty bicycles were imported into Chiengmai, Siam, during 1897, chiefly of American, German, and French manufacture, the American machine being the most popular, owing to its cheapness and durability.

### MEET TO FIX PRICES

New York Jobbers of Sundries Endeavoring to Fix Schedule for Retail Trade.

Representatives of all the leading jobbers of bicycle accessories and fittings in New York City met recently to establish a schedule of prices for selling this character of merchandise over the counter to the small city trade. Of twenty-seven jobbing houses, representatives of twenty-three were present. Two committees were appointed. One of the committees was charged with formulating and submitting a schedule of uniform prices for the class of local trade referred to, and consists of representatives of the following concerns: Hartley & Graham, John S. Leng's Son & Co., R. H. Ingersoll & Bro., J. Frank, Miller & Schnauffer, Schoverling, Daly & Gales, with C. Murray Rice ex-officio member. The other committee was appointed to confer with organizations of like nature, relative to sustaining the schedule of prices when established.

A meeting was held last Monday for the purpose of hearing the reports of the committees appointed at the first meeting. The price committee reported its inability to agree on prices for standard sundries and the committee was discharged.

A committee of ten was appointed to call on the jobbers in the district and find out if they would bind themselves to abide by a scale of prices to be adopted, with a penalty of \$250 for violation of the agreement by a principal and \$25 if by an employe. This committee has power to call another meeting if it should develop that a sufficient number of pledges are obtained to the agreement.

### Suppressing Coupon Trading System.

Washington, Nov. 21.—The prosecuting attorney of this city has sworn out warrants against the Merchandise Investment Co., and Harry King, manager of a large department store, charging them with conducting gift enterprises in violation of the law. The investment company is said to operate a coupon book system similar to one with which dealers in cycle sundries have been approached in different cities during the past year. The plan worked by the department store is said to be precisely similar to the trading stamp system used by the National Trading Stamp Co., which was forced out of business last year. Among the articles proposed to be given away were bicycles of a well known make. Both cases will be tried shortly.

### Cycling Popular in Berlin.

The Berlin police department has issued 67,500 cycling permits during the past three years, and adding the estimated number of unauthorized riders, and the 30,000 cyclists of the suburban districts, the total number of cyclists in Berlin and its environs is placed at 110,000. The population of the German metropolis and its environs is 2,000,000 in round numbers, which gives 55 cyclists to each 1,000 of population.

Bicycles to the value of \$1,500 were recently shipped to South Africa by a Canadian maker.

**ORGANIZE ONLY, INFORMALLY****PARTS MAKERS' PLANS BROADEN****Representatives Meet in New York and Elect President and Secretary—Committees Appointed.**

New York City, Nov. 21.—The nucleus of what may eventually become a more formal organization was developed at a meeting of parts manufacturers held here last Thursday. The suggestion as to the lack of formality in the organization refers only to the fact that while the Cycle Parts Manufacturers' Association was formed, with R. H. Ramsey, of the Ramsey Swinging Pedal Co., as president, and I. H. Dreyfuss, of the Stockton Mfg. Co., as secretary, no constitution was adopted, and no agreement to sign any compact was reached. The promoters and organizers deemed it expedient that no constitution be adopted and no agreement signed for the present, until the objects of the association are more satisfactorily and completely determined upon and embodied in some more formal declaration of conduct. The fact is, Dr. Stockton's scheme has outgrown its original purport and now looks to a combination of the separate branches of the partsmaking trade, with each branch, to a certain extent, looking after its own particular interests.

**Government by Committees.**

In general it is proposed to have the classification of goods and the scale of prices, as well as the general government of the association, in the hands of an executive committee, consisting of the president ex-officio and the chairman of the committees on hubs, pedals, balls and chains—the present factors included in the association.

In view of this change in general scope and membership, it was found impracticable to put through the agreement reported and outlined in the Cycle Age at the time. In fact there was no very general assent to signing such a formal agreement.

**The Resolution Approved.**

The following resolution, which outlines the general plan proposed and approved by the promoters, though not formally adopted in so many words, was reported by the committee:

MOVED, That it is the sense of the bicycle manufacturers here assembled, that to secure some plan of uniform co-operation in the marketing of our various productions of bicycle parts is desirable, and to that end it is further moved that we proceed to perfect a permanent organization by electing a president and secretary; and that the rule governing this association shall read as follows "All prices offered must receive the unanimous vote of those present to be adopted," be maintained in the organization.

THAT: Manufacturers who hear of prices or terms being deviated from shall submit to the secretary such information as they have, and the secretary shall immediately take up the matter with the accused, ascertain the facts of the case and communicate them to the party making complaint; that manufacturers against whom complaints are made will furnish the secretary with such information as they may be able to give, and that, in case complaints cannot be settled by correspondence, the secretary is authorized to visit the party accused and investigate the facts by a personal interview and examination of such books and records as may be necessary.

With a view of meeting competition of manufacturers who are not members of this organization, and preventing the cutting of prices at points where it is at times wholly unnecessary, it is mutually agreed: That no member of this association shall deviate from the prices and terms agreed upon without first obtaining permission from the secretary; that such request give the competitor making lower price, name of party to whom competitor made price, and all information as to why change in association price is requested, and if, in the judgment of the secretary, it appears desirable to grant such permission, he shall

immediately wire his consent to member making request, and shall at the same time notify every member by wire, giving each permission to name the same price to the same party, and to this party only.

The following concerns were represented: Julius Heinemann & Co., Chicago; Modan Mfg. Co., Cleveland; Columbia Machine Works, Brooklyn; Ramsey Swinging Pedal Co., Philadelphia; Bridgeport Gun Implement Co., Bridgeport; Syracuse Arms Co., Syracuse; Cleveland Machine Screw Co., Cleveland; Stockton Mfg. Co., Newark; Hollingshead & Wirtz, New York; White Sewing Machine Co., Cleveland; Snow Chain Co., Syracuse.

In all thirty-one concerns were either actually represented or had promised personally or by correspondence to come into an association formed for the purposes and in the line of the resolution quoted above.

**President Appoints Committees.**

After some debate as to whether the committees should be appointed or elected, the following were appointed by the president, after consultation with those present:

Hubs—Hunter Arms Co., Fulton, N. Y.; Weston-Mott Mfg. Co., Utica, N. Y.; Stockton Mfg. Co., Newark, N. J.

Pedals—Syracuse Arms Co., Syracuse, N. Y.; Bridgeport Gun Implement Co., Bridgeport, Conn.; White Sewing Machine Co., Cleveland, O.

Balls—Cleveland Machine Screw Co., Cleveland, O.; Grant Ball Co., Cleveland, O.; Steel Ball Co., Chicago.

Chains—Indianapolis Chain & Stamping Co., Indianapolis, Ind.; Lefever Arms Co., Syracuse, N. Y.; James Duckworth & Co., Springfield, Mass.

These committees will request samples in their respective lines, and enter at once upon the classification of goods and the fixing of a minimum price scale. The latter is subject to the unanimous approval of the members. Secretary Dreyfuss thought that the executive and sub-committees would be far enough advanced with this work for a general meeting of the association within four or five weeks. It is expected that the executive committee will at that time be ready to report a fuller and more definite plan of organization and procedure.

In view of the possibility of makers who are not members of the association selling goods below the fixed scale of prices, it was suggested that those association members in direct competition with them stifle this by cutting under their prices, and that the association reimburse such members for the loss entailed by them in meeting such competition.

**Manager Charged with Embezzlement.**

Washington, Nov. 21.—J. F. Broadbent, formerly manager of the Cleveland Cycle Co., of this city, are arrested in Baltimore last Thursday on a warrant sworn out by J. D. Arnold, proprietor of the store, who charged him with embezzling \$200. Investigation by an expert accountant disclosed false statements in the books of the company, with the result that a total defalcation of \$1,300 is now charged against the late manager. Broadbent was discharged from the management of the Cleveland Cycle Co. last August, but not on account of any suspicion of irregularity in his accounts. Some weeks later, however, when persons to whom bills for overdue accounts were sent came to the store and presented receipted bills, an examination of the books was made, with the above result. Broadbent was considered one of the most popular men in the local trade.

Bicycles are being introduced into the postal service in the City of Mexico, the postal authorities having lately purchased thirty-six machines for the purpose.

**SWEDISH MARKET OVERLOADED****GERMANS MAKE STRANGE ERROR****Expecting Duties to be Increased July 1, They Make Large Shipments in June—Retail Trade.**

Soderhann, Sweden, Nov. 17.—The Swedish market has been much disturbed the past summer, because of a curious mistake of the German manufacturers and exporters, who supposed that the new tariff law, passed early in May, greatly increasing the duty on bicycles and parts, would go into effect July 1. Under this impression the Swedish market was swamped in June by the dumping of great quantities of German and Belgian machines; but the new tariff does not become operative until January 1.

Late in September a traveling man for a well known German manufacturer arrived in Stockholm, with \$10,000 worth of bicycles, which he readily disposed of. Subsequently he received another shipment of \$15,000 worth, which he also sold; and now he has returned home to bring a third lot before the duty is increased. These large movements of goods have relieved many German makers of their stocks, and given them an opportunity to keep their factories running, but the reaction will come next season, when shipments will be meager because of the Swedish market being flooded this fall and winter.

Parties who have been handling American goods have not been idle, either, but are laying in as large stocks as capital and circumstances will permit.

**Looking Forward to Christmas Trade.**

The selling season is well over now, but the approach of Christmas lends some life to the retail trade, for the holiday trade is not to be despised. Only the wealthy class buy bicycles for Christmas gifts, but as a consequence the machines that are sold are of the better grades. Last Christmas three diamond and two drop frame bicycles were given and received by members of the royal family, and of course the upper society members follow the example.

The cycle trade of Sweden is handled by the native factories through regularly appointed agents, and by three or four large importing firms and several smaller ones through sub-agents who are exclusive dealers in bicycles and cycle sundries, and through hardware, furniture, shoe, grocery and crockery stores. There is but one department store in the country. It is situated in Stockholm, and is the sole agent for Columbia and Hartford cycles, whose sale it has pushed most energetically, having placed neat signboards on the outside walls of every railway station of any importance in the entire country. Prices were maintained even better by this house than by many of the smaller dealers, who advertised machines at reduced prices late in the season.

**English Cycle Makers Founder.**

The Raleigh Cycle Company, one of the largest and oldest cycle making concerns in England, has gone into the hands of a receiver. For some time it has been an open secret among the British trade that the company has been in financial difficulties. A plan for reorganization will be submitted to the stockholders. The banks forced the concern to the wall.

Receiver Isaac N. Dann, for the New Haven Chair company, insolvent makers of bicycles in New Haven, Conn., has filed his report and been discharged. There are funds enough on hand to pay 3 per cent dividend on \$85,127.99 liabilities.

### TANDEM TRADE AND MAKING

The impression has gained currency that tandem riding is strongly on the decline; and most bicycle manufacturers stand ready to assert that the impression is based on uncontrovertible facts, because they know that their own sales of tandems have failed to show an increase at all commensurate with the increased sales of single bicycles.

From information at hand, it may be considered quite certain that the records of bicycle manufacturers tell the truth in this matter, and that the number of people who have bought tandems made by the standard manufacturers is reduced this year in proportion to the number of those who have bought single bicycles made by the same manufacturers. But nothing is easier than to draw too-sweeping inferences from this fact in regard to the popularity of tandem riding. The statistics, while true so far as they go, are misleading because they do not tell the whole truth. They are especially misleading if the results of this year's trading in tandems are taken as an indication of what next year's trading must be.

One of the two important factors which have been ignored is the extensive tandem-building which has been going on among the most advanced class of repairmen. For this branch of manufacture no statistics exist except such as may be obtained from the makers of tandem tube connections and fittings, and from tire makers. These are not easily obtained, and would be difficult to justify when collected. It is almost beyond doubt, however, that the number of tandems which have been placed in the hands of riders through this form of production is very considerable. Tandems are used very largely by riders who are perfectly conversant with trade and price developments for a number of years past, and who have definite, if not always intelligent, ideas of what they want in the way of construction. It has been very natural for this class to affiliate with the repairman-builder and give him their orders for tandems built in accordance with their views. The reluctance shown by dealers in the beginning of the past season against buying more stock than they knew they could dispose of, also strengthened the business of building tandems to order considerably, because tandems are more risky stock to carry than singles, and, on the other hand, the rider with the definite ideas wants to see a greater variety of patterns of tandems than of singles before he can make up his mind that he has found what he wants. In the absence of a large variety of stock patterns to select from, he finds himself most easily suited by telling the local builder what he wants, and having it done. The somewhat imaginary satisfaction of having a two-seated machine "built to his own specifications" also appeals strongly to his vanity, and, in accordance with the rule that "self-made is well-made," it is the very satisfactory observation of the local builder that he has small trouble in obtaining good pay for repairs on tandems which have been constructed "to order," while the dealer who handles tandems in stock has a peck of trouble whenever something goes wrong with the goods he has sold.

There are still other reasons why tandem-assembling has fallen largely into the hands of local builders. Aside from the reluctance of dealers to handle the stock in sufficient variety, the large manufacturers have not, as a rule, been particularly desirous of stimulating this branch of the industry, on account of the

difficulty in reconciling good and durable construction with the popular demands. The riders have never been willing to accept the weights which are really necessary for making a tandem construction durable. The tandem frame has been a spring frame to all intents and purposes. The length of its truss work, coupled with the diameter and gauge of tubing which the demand for light machines made imperative, produced a yielding frame, which was easy to ride over smooth and level ground; but which was unsuited for long withstanding the severe strains of hill-climbing or racing. The most expensive material and workmanship were absolutely required for securing even comparative freedom from repair troubles, and the decline of prices made it particularly onerous to use such material and workmanship while other more profitable production was going on. Manufacturers have been well aware that a considerable addition of metal would be necessary to make the manufacture of tandems satisfactory; but the public has not subscribed to this amended creed, and hence the manufacture has languished. The great variety of new tandem patterns which are continually being proposed by English makers testifies to their appreciation of the problems involved in this clash of requirements. We are somewhat behind in earnest attempts at solving these problems, and meanwhile they have been left to those tender mercies which the rider is more willing to extend to a local builder than to a manufacturer of national standing.

Considering these and other forces which have caused tandem-making to drift gradually, though probably only temporarily, away from the established manufacturing concerns, it is easy to credit the local builders with sufficient trade in the tandem line to offset the inference that manufacturers have drawn from their own experience in regard to the popularity of tandem riding. At all events, the question can hardly be considered as closed, when arrangements for next year's trade are under debate.

While the success or failure of the tandem trade is eventually a question of cycle mechanics—complicated, perhaps, by the possible advent of cheap motor vehicles—the results which manufacturers have noted this year have indubitably also been largely influenced by other things. The effects of the prevailing low scale of prices for single machines are in this respect of high interest. It is first to be observed that the decline in the demand for tandems is in very few instances an absolute numerical reduction of sales, but only a proportionate reduction. It was not that the public loved tandems less this year, but that they loved single machines more. The lower prices drew forth a new and large class of customers for single machines—a class composed of people who had formerly considered cycling as beyond their means. The existence and aggregate importance of this class constituted a feature of trade which was distinctly recognized by dealers last spring. These recruits to the ranks of cyclists could not have been expected to buy tandems, but their numbers swelled the sales of single machines which are on the records of manufacturers and thereby dwarfed the sales of tandems by comparison, but by comparison only. Whether this class of purchasers will afford a new crop of tandem purchasers in due course of time remains an open question. Probably it will not furnish as large a percentage of tandem riders as the earlier stock of cyclists, but its numerical strength would seem to promise at least so much for the tandem market as to make it worth the while of those manufacturers who desire to cultivate the tandem trade to take the chance under consideration. This, their first, year they could not under any circumstances have been expected to buy anything but single machines. If they should prove all-around customers in the future to only a limited extent, a somewhat greater production of tandems than this year's business at first blush would seem to justify, comes within the range of possibilities to which the prudent manufacturer should give a little thought.

It is another question how long the large manufacturer can afford to permit the making of tandems to drift away from him, and whether the time has not arrived for displaying a similar energy in producing new tandem patterns as that displayed by English concerns.

\* \* \* \* \*

In the selection of sidelines conscious effort should be made to obtain articles of value as novelties. Novelties attract attention. They form a continual invitation for customers to stop

and look, to come in and inquire, and finally to buy. There is, however, a class of cycle tradesmen who seem to fear novelties, and who prefer to keep as sidelines only those classes of goods which have been known for years. One of the chief differences between stores in the city and in the country lies in this very point. Usually storekeepers in the cities are constantly on the lookout for something new, and frequently replenish their stocks with fresh and attractive goods, and thus maintain a display which, from its novelty, offers a strong temptation to the buyer. It is necessary to present new goods in order to attract custom; and, if care is taken in their selection, there is little danger of having dead stock accumulate. The enterprising dealer is watchful, and secures novelties as soon as they are issued. By this means his store becomes known as headquarters for the latest styles, and he reaps advantages which his energy deserves. Of course, judgment must be used in selecting novelties as well as staple goods, and this requires an intimate knowledge of the wishes of customers, for experience shows that the buyer cannot depend entirely upon his own taste. It does not pay a tradesman to wait until his competitor is well stocked with novel sidelines before making any effort to give novelty to his own stock. A little well directed energy, and a proper regard for the desires of customers, will go far toward making success.

\* \* \* \* \*

No amount of fine sophistry on the part of Mr. Frank Sanger or his emissaries can convince the bulk of bicycle makers that the projected show in New York City is entitled to support at their hands. It is now one month since, in violation of the wishes of a majority of all kinds of makers concerned with cycle manufacture, this enterprising showman tossed his castor in the ring and declared his willingness to meet and defeat all who opposed him in his long cherished desire to again conduct a cycle exhibition, and in that time he has only been successful in bagging nineteen concerns. It is true that of these nineteen a few occupy positions in the trade which preclude the possibility of supposing that they have ever been won over by any false arguments, for all have had experience in cycle shows conducted upon a national scale. It would seem, from opinions privately expressed by manufacturers who have been solicited to take part in the New York exhibition, that Mr. Sanger is utterly unable to point out the special need for shows. Indeed, it is with difficulty that an audience can be obtained for the purpose of arguing the necessity for safeguarding Mr. Sanger and his associates against any possible money loss in the enterprise. The gross revenue to be derived from the sale of spaces, though rentals are considerably reduced, amply bears out the belief that Mr. Sanger's interest in the cycle trade is not of such an unselfish character as to lead him to risk a copper piece in advance of the hour when the doors of the exhibition will be thrown open to the public. The manufacturers find themselves confronted with a situation in business which is unparalleled in the history of the trade for early buying by agents and apparent desire to steadily progress to rapid deliveries. Traveling salesmen are everywhere. New models are being exhibited to the trade, and by the arrival of the time when the Madison Square Garden exhibition is scheduled to open there will not be a hamlet in this wide country, however remote, that will not have been visited by missionaries from the factories. Naturally, then, the question arises—What is the purpose of the New York exhibition? Is it to be local or national in character? If the former, then what is the necessity for soliciting western and middle state manufacturers to contribute money for the support of an exhibition which will only aid their New York agents? If the trade of the New York agents is in need of stimulation, assuredly they should not ask the manufacturer to bear all the burden entailed in reviving their fortunes. If the show is to be on a national scale, it is idle to give it more than passing consideration for, as has already been pointed out, the functions which have usually been reserved for such an exhibition cannot this year be put in evidence, owing to the unprecedented heavy buying by agents. Now comes the rub; why did Mr. Sanger select the month of January for the holding of a cycle show? It is stated upon reliable authority that no other date was available at the Madison Square Garden. If this be true, it is easy to conclude why Mr. Sanger did not warmly embrace the proposi-

tion to change the nature of the exhibition and endeavor to make it of local service to the agents at a time in the spring when they could entertain the hope of getting special benefits from meeting customers in mass. Whatever motives may be actuating Mr. Sanger, or the trade, it is manifest that the project is meeting with very little encouragement. One saddle company, four bicycle makers with strong eastern connections, two tire concerns, and a dozen establishments variously engaged in the manufacture of electric batteries, sporting goods, badges and cycle sundries, make up the company which at the present hour is lending encouragement to the exhibition. Spaces have been reserved by one large bicycle making concern, also strongly entrenched in the east, a lamp company of national reputation and a few others, and these are being used as bait to lure others

\* \* \* \* \*

The loss which the retailer suffers from not having goods in stock when they are called for is far greater than that which falls to the portion of the maker, for while the latter may console himself with the knowledge that the former will only be impatient till his shipment arrives, and is reasonably sure of his customer, the agent has no such comforting thought and no such sense of security. It would be misfortune if, from this plain presentation of an axiomatic statement, the dealer should be led to suppose that the manufacturer is eager for a return of the days when early orders streamed into his factory and so inflamed his imagination that he failed to discern the distinction between a customer with a marked propensity for gambling in futures and one who merely desired to guard against the accident of delay in delivery. Just a twelvemonth ago the agent awoke in surprise to find that he had for a long period of years been the too credulous dupe of designing salesmen who, with more cunning than wisdom, prevailed upon him to believe that there was singular luck in store for those who flung prudence to the winds and ordered their stock of goods in advance of timid competitors. The change of heart and habit which dated from that time has brought in its wake a wholesome realization of the responsibilities, which the dealer owes to himself, his competitors and his supply houses, in fact, the entire trade. And, as luck would have it, he was supported in this suddenly acquired desire to practice the teachings of wisdom by the very people who, of all others, stood most in need of a similar course of schooling, to wit, the sellers of parts and material. The junction of these two forces, and these alone, is responsible for the remarkably conservative tone of wholesale and retail markets throughout the season just ended. Still, in view of the altered conditions which now attend the retailing of cycle goods—the lowered list prices and consequent possibility of making a greater number of cash sales, and the increase in the purchasing power of the people at large owing to the improved conditions of business—it is not beyond the limits of good judgment to advise even the humblest agent to bestir himself and not wait until through over-caution he is cheated of profits on early sales, to which he might lay claims if his courage was equal to his desire for gain and he had at least samples of new goods to exhibit to prospective customers. It is as sure as the provoking uncertainty of the meanest of men's hopes will permit that the approaching retail season will lend powerful encouragement to the agent, for all the indications that are worth consulting and translating into business significance lend color to the high hopes which are dominating the manufacturers and impelling them to be early afield. The new goods may not be faultless, but they certainly will represent a structural advance; trade discounts will compare favorably with those obtainable last season; the people are prosperous, and there are fewer misgivings in the minds of the most astute observers in the bicycle and all other lines of trade than at any time within many years.

## The Morrow Automatic Coaster and Brake

### Just a Few Words...

THE constant pumping motion of the legs, when not actually required for propulsion, is wholly relieved by the automatic coasting attachment, and one is enabled at the same time to shift his position in the saddle and rest. This is an important consideration especially when out on a long run. And then the pleasure of coasting has about it a peculiar charm, especially when one is conscious that his wheel is under perfect control. On the level, a little rapid foot work and then a rest breaks the tedium of a continuous pull at the pedals.

Wise Buyers will secure the agency for some of the following wheels as they all have it: Spalding, Pierce, Acme, Stearns, Orient, Iver Johnson, White, Reading-Standard, Eclipse, Thomas and other American bicycles, besides Humber, Rover, Triumph, Rudge-Whitworth and other English makes.

## WHEELER SADDLES

HAVE ALWAYS BEEN MADE WITH THAT  
CURVE IN THE BACK.

OUR LINE FOR '99 COMPRISES BUT FOUR DISTINCT MODELS:

- "EXTRA" Woman's . . . Broad, Soft and Easy. ❀❀
- "EXTRA" Men's . . . Hygienic and Durable. ❀❀
- "SPECIAL" Roadster . . . An ornament to any wheel.
- "CORK-TOP" Racer . . . Light and Graceful. ❀❀❀

These saddles are made and finished in the careful and stylish manner that has always characterized Wheeler Saddles.

Send for samples of the most popular saddle on the market.

## TO DISSOLVE THE BOARD

### Nineteen Out of 193 Stockholders Vote to Disband—Members Recently Admitted to be Rebated

New York City, Nov. 21.—Only by the performance of a miracle can the National Cycle Board of Trade be saved from dissolution. Last Thursday 19 out of 193 stockholders met here in response to a cheery call for a meeting which, to borrow the language of this communication, would be largely occupied "in considering the future work of the Board," but such is the elasticity of our language, and such the mutability of human wishes, that the work of the meeting was solely confined to the counting of noses and the unopposed passage of this resolution:

Resolved, That in the opinion of the stockholders of the National Board of Trade of Cycle Manufacturers it is desirable that such corporation should be forthwith dissolved.

#### Quorum Secured With Difficulty.

It was with difficulty that a quorum was secured at the meeting. Those in attendance, with their actual stockholdings, were as follows:

C. S. Dikeman . . . . .	5
Kirk Brown . . . . .	5
A. L. Moore . . . . .	5
R. S. Crawford . . . . .	25
Geo. H. Day . . . . .	12
A. L. Garford . . . . .	5
Jos. McKee . . . . .	5
J. C. Pierrez . . . . .	1
W. A. Harradon . . . . .	2
F. P. Prial . . . . .	10
J. R. Miller . . . . .	5
A. G. Thompson . . . . .	5
W. I. Bunker . . . . .	5
Eugene Ward . . . . .	5
C. W. Cushman . . . . .	5
G. W. Cole . . . . .	1
A. M. Scheffey . . . . .	5
W. T. White . . . . .	5
A. R. Peck . . . . .	5

Shares actually represented . . . . .116

#### Only Nineteen Votes to Spare.

These stockholders held proxies for 351 shares, making a total of 467—a majority of 19.

Proxies for 351 shares were held as follows:

		46

The capital stock of the corporation is \$10,000, divided into one thousand \$10 shares. The number of shares issued stands at 895.

#### Stockholders Must Meet Again.

The etiquette of the law requires the directors to take cognizance of the action of the stockholders, and on this account the directors must meet and advance the ceremony of dissolving the corporation. Moreover, the stockholders must also meet again and by a two-thirds vote of all the stock approve the recommendation of the directors. In this work at least 75 days will be consumed.

Meanwhile instructions have been given to Secretary Hammann to reduce operating expenses, stop publication of the Bulletin, wind up the collection department and sell the office furniture and fixtures.

#### Recently Elected Members in Luck.

Immediately after the adjournment of the stockholders' meeting the directors, in special session, passed this important resolution:

Resolved, That the treasurer be authorized, and he is hereby directed, in the event of the corporation being dissolved within five months from date, to repay the stockholders admitted to membership in the board on August 18, 1898, the amounts respectively paid by them for stock in such corporation.

Those who were elected to membership on August 18 are as follows:

Abbott, W. J., Duquesne Mfg. Co.
Arnstein, Eugene.
Bailey, R. M., Fairbanks-Boston Rim Co.
Benjamin, C. A., Olive Wheel Co.
Blaurock, J. A., American Tire Co.
Brownridge, W. T., Rex Cycle Co.

## BICYCLE TRADE IN PARA

### Board of Police Selects American Machines and Discards all other Foreign Goods.

The one marked development in the city and region of Para within the past six months has been in the bicycle trade. The American machine was there brought into notice in the following peculiar manner:

It appears that for some time past the adoption of a bicycle by the entire police force has been rapidly gaining favor, and in consequence thereof a recent special session of the police board was called with a view to putting the question to a test vote. After mature reflection the board decided to recommend the adoption of the bicycle. A committee was appointed, consisting of three experts, with instructions to carefully canvass the Para market with a view to securing the most substantial and generally superior machine for the least money. The committee advised, in the strongest terms, a bicycle made in the United States, adding that it clearly outclassed any other in the market. The machines were forthwith adopted. The gratifying result was that the public, appreciating the test, have had their faith in our bicycles greatly increased.

The freight rate from Para to New York is 25 cents per cubic foot, or about 17 per cent less than from Para to Europe.

The majority of merchants in Para require from ninety to one hundred and fifty days' credit; some, of course, only ask for half of such time. Germans stand ready to meet all requirements and competition. Our salesmen must expect to encounter sharp competition.

There is a broad and steady expansion of trade throughout the states of Para and the Amazonas. The city of Para, situated only about 100 miles from the mouth of the Amazon river, is the key to an enormous stretch of wealthy country. Over one hundred and fifty steamers are employed on the Amazon and its tributaries (about one-third of these vessels belonging to a British company), and the number will be increased materially before the end of the year. The internal communication afforded by the Amazon and its branches is so complete that railroads and means of transportation are not needed except to connect parts of rivers obstructed by rapids. Commerce at Para has developed enormously within the past few years.

#### Sidelines Keep Trade Active.

Buffalo, Nov. 21.—Those dealers who adopted the sideline idea this season or previously, particularly those who are handling football and golf articles and

amateur photographic apparatus and supplies, are doing a good business now, while those who procrastinated or neglected the opportunity, have entered upon their usual winter idleness. Side-lines have not been generally adopted, perhaps because of a fear to venture. At the close of the selling season, when suggestions were made of various side-lines that could be adopted whereby the dull season could be tided over, most of the local dealers were enthusiastic and seemed eager to get in line and adopt one or another of the many ideas advanced, but up to this time not more than two or three have actually laid in such stock.

**SUITING TASTES OF BUYERS**

**Low Prices 'Should be Quoted with Extreme Care in Order not to Offend Customers.**

Unseemly haste to get rid of a slightly out-of-date machine, whether used or unused, is liable not only to defeat the particular object sought, but to lose the sale of a more modern mount. Making a special low price for the purpose of disposing of some old model should be done with extreme care, and always with due respect for the personal preferences of the purchaser.

Customers desirous of purchasing bicycles generally have, before buying, determined approximately the amounts they are able and willing to invest. Therefore, it may be easier to sell them medium grade, up-to-date machines—if their tastes run in that direction—regular list price \$35 for full price, than to sell them slightly out of date \$100 list mounts for \$35. And should \$50, \$60 or \$75 be the amount of their prospective purchase, and they should be offered the said \$100 models for \$35, they would probably reject the offer with indignation, and select from among the higher priced ones.

If, for instance, a woman of taste desires a bicycle, it is manifestly unwise to offer a reduced price on an old machine. Therefore, in some instances, nothing is gained by marking down the prices of bicycles; while such a practice is simply lowering the character of the machines in the fickle estimation of buyers, to no purpose. The most likely propositions of sale are those made with reference to suiting the tastes and financial abilities of the purchasers, so far as these can be discerned or learned and met by the retailer.

**Trade Circulars Useless in Japan.**

In Japan, where two-thirds of the bicycles in use are of American manufacture and the other third British, circulars and price lists from ambitious exporting houses are getting so common that they threaten to defeat the very end they are intended to serve. The hotel reading rooms and private offices are stocked with mail matter from all parts. In the United States, circulars and price lists alone may produce some result; but they will avail but little, 9,000 or 10,000 miles away from home, unless followed up by salesmen. One firm might deluge the market with trade literature for years, and another could send an energetic man along and pick up all the business. It might be well to pave the way by advertising, but in order to insure sales the man must be upon the ground. He must be intelligent and persistent, and his firm should bear in mind that this market is not worked any more easily than are the overworked markets at home.

**Sidewalk Cycle Racks Must Go.**

The sidewalk cycle rack is in such ill favor with the city fathers of Rochester, N. Y., that an order has gone forth prohibiting its use. Perhaps by the time the civil magistrates have mulcted a few

teamsters for damages done to machines while propped up against the curbstone, the rack may be restored to favor.

**MEXICO IS FLOURISHING**

**Its Bicycle Dealers are Ordering Heavy Shipments from the United States.**

The demand for American bicycles, parts, and sundries in Mexico is by no means inconsiderable, and it will be well for makers to pay more heed to that market. Many of the chainless models have found their way into Mexico, which now boasts of a very respectable number of retail dealers and jobbers. It is a very different market compared to what it was reported to be by the venturesome salesman who blazed the way some years ago. Now scarcely a day passes without the exchange of correspondence between some of the large distributing houses and the wide-awake bicycle manufacturers, parts and supply houses in the United States, who have marked the surprising growth of the Mexican demand for their goods. For the eight months ending with August of the present year the Mexican imports of cycles and parts amounted to \$45,216.

There is, among foreign merchants there, a strong feeling against Americans, who, they believe, are menacing their long-established interests in that country. The continual growth of American business in Mexico, the great railways managed by Americans, the growth of financial interests in the hands of Americans, etc., fill them with dread. Mexico has been a place where the German and Frenchman and the Spaniard could make fortunes on the basis of trading for large profits. The American idea of quick sales and small profits is not to their fancy. All the European merchants carry American goods.

Mexico is flourishing. One hears of many great projects about to be realized. There is remarkable activity in real estate, and certainly Guadalajara and Pueblo are object lessons in progress. The long peace President Diaz has given the country has transformed the Mexicans into investors. The number of large individual bank accounts has grown beyond the power of bank managers to recall the names of their owners. Wealth is increasing in an extraordinary manner. Much money is being made in agriculture, both in the tableland region and down in the hot country. The number of men who are worth \$50,000 is very large; those who have from \$10,000 to \$200,000 are beyond all reckoning, and fortunes of \$1,000,000 to \$5,000,000 are becoming common. The country is prospering, and everybody is for Diaz and peace; there are no longer any parties worth the name, and politics is dead. Mexico has passed definitely from the revolutionary epoch to that of peaceful progress. The man who would be most hated in the country would be he who should try to raise a row.

The Mexican congress has received a bill regulating special privileges to new companies, and provides for granting franchises to new manufacturing and other industries for from five to ten years, according to the importance of business and the capital invested. It is provided that companies organized under this law shall be relieved from federal taxation during the life of the privilege, and that the material required in new industries shall be imported free of duty. The old law made \$250,000 the minimum amount of capital required to enjoy the immunities, but the new law reduces the amount to \$100,000.

**German Imports and Exports.**

The German export trade in cycles and cycle parts is developing at a steady

rate. The returns relating to the eight months ending with August last show that during that period the exports amounted to no less than 1,253 tons, as compared with only 561 tons in the first eight months of 1897. There has also been an increase this year in the imports of foreign cycles and parts into Germany. For the eight months ending with August last they amounted to 693 tons, as against only 425 tons in the corresponding period of 1897.

**AMERICAN AND ENGLISH EXPORTS**

**Two Weeks' Reports Contrasted—Our Shipments Almost Double Those of Mother Country.**

Exports of bicycles and bicycle material from the port of New York for the two weeks ending November 15 are recorded as follows:

	Bi-cycles.	Ma-terial.
Belgium . . . . .	168	\$ 1,729
Holland . . . . .	2,096	2,304
Denmark . . . . .	7,924	15,813
Norway and Sweden . . . . .	3,768	8,510
France . . . . .	1,370	121
Italy . . . . .	210	569
Russia and Finland . . . . .	240	322
Portugal . . . . .	746	6
Germany . . . . .	4,011	16,474
United Kingdom . . . . .	21,353	6,496
Austria-Hungary . . . . .	235	....
Mexico . . . . .	339	....
Central America . . . . .	866	38
West Indies . . . . .	1,291	337
Brazil . . . . .	866	280
Argentina . . . . .	1,730	3,337
Other South Amer. countries . . . . .	5,006	1,871
Asiatic Turkey . . . . .	....	25
East Indies . . . . .	13,954	497
China . . . . .	2,925	36
Africa . . . . .	15,326	784
Australia . . . . .	1,644	953
New Zealand . . . . .	14,642	39
Totals . . . . .	\$100,710	\$60,541

Exports from England for the two weeks ending November 4 were as follows, the figures for bicycles and materials being combined:

South Australia . . . . .	\$ 3,995
Egypt . . . . .	100
British Guiana . . . . .	1,150
British India . . . . .	18,375
France . . . . .	295
Queensland . . . . .	2,020
South Africa . . . . .	19,000
New Zealand . . . . .	4,795
Ceylon . . . . .	1,880
South Africa . . . . .	4,970
Netherlands . . . . .	1,980
Italy . . . . .	725
Gibraltar . . . . .	40
Germany . . . . .	725
Tasmania . . . . .	400
Hong Kong . . . . .	120
British West Indies . . . . .	85
Portugal . . . . .	200
Mauritius . . . . .	100
Victoria, Australia . . . . .	18,735
Belgium . . . . .	645
Straits Settlements . . . . .	1,380
West Australia . . . . .	2,060
Burmah . . . . .	195
Russia . . . . .	345
New South Wales, Australia . . . . .	2,200
Canary Islands . . . . .	200
Japan . . . . .	440
United States . . . . .	180
China . . . . .	75
Total . . . . .	\$88,410

**American Bicycles in Africa.**

The imports of bicycle and parts into all parts of South Africa, with the exception of Lourenco Marquez, in Portuguese territory, for the six months ending June 30, 1898, were to the value of \$592,200, of which the United States furnished \$82,531. The United Kingdom stands first, the United States second, and Germany third in imports. The governmental returns on the exports of bicycles and parts from the United States to South Africa for the eight months ending with August—1896, 1897 and 1898 compared—are as follows:

1896 . . . . .	\$ 16,893
1897 . . . . .	91,282
1898 . . . . .	117,447

At a recent meeting of the cycle agents and dealers of the City of Mexico the formation of a cycle trade association was decided upon.

## TEMPERED IRON CASTINGS

### White Cast Iron Machined, Welded, Drawn, Hammered and Hardened After Annealing Under Pressure

The word "iron-steel" has been frequently mentioned of late as denoting one of the many new forms of iron alloys which have come into existence as a result of the extensive experimenting continually going on in steel making plants. To the steel working establishments in general the full meaning of the term has, however, not been known. In fact, the idea that such a term as iron-steel might be appropriately used has been scoffed at as being contradictory of the accepted definition of steel. It must be either iron or steel, according to its chemical composition and molecular structure, it was commonly said; but this was only a question of phraseology and technical stringency in expression, and the term iron-steel was used not technically, but rather to indicate that a process had been discovered which seemed to efface the distinguishing line between iron and steel so far as the process of manufacture and the quality of the product were concerned.

#### A Sensational Patent.

A full line of facts has not come to hand as yet, but a patent which was issued on the 15th of this month to Samuel Hufty, of Camden, N. J., and Joseph K. Caldwell, of Philadelphia, throws considerable light on the work which is being done for producing iron to which many of the qualities of steel may be imparted by a simple process of annealing or heating under pressure.

#### Molecular Rearrangements.

The fundamental thought of the invention is that it is possible to change the molecular structure of an iron alloy at a temperature much below the melting point, and that it is also possible to restrain the transition of carbon from the amorphous to the graphitic condition by pressure, and cause it to assume new molecular relations to moderately heated iron molecules while in that condition. By carrying this thought into practice under certain conditions the inventors produce an iron casting which is highly tenacious, soft, malleable, and easily machined, is capable of being readily forged and welded, and is susceptible of hardening or tempering in either oil or water, thus being applicable not only for all purposes for which castings of iron are generally used, but also for many purposes for which steel castings or even steel forgings are now employed.

It will be seen at once that these results are of a highly sensational nature and that the invention bids fair to be epoch-making in the steel industry if all the claims are fully substantiated.

#### Composition of the Iron.

In the following account of the method and the theories involved in it, the phraseology of the inventors is largely employed:

The castings in the first instance may be composed of any ordinary white cast-iron suitable for the production of malleable-iron castings, although it is preferable that the iron should contain some free carbon and a considerable percentage of silicon, an iron which, after melting, contains about the following proportions of combined carbon, graphite, manganese, silicon, sulfur and phosphorus being suggested as the preferable one from which to make the original castings: combined carbon, 2.75; graphite, 0.50; manganese, 0.150; silicon, 0.750;

sulfur, 0.020; phosphorus, .015. The castings are placed in a furnace in which they can be raised to and maintained at a high temperature, and for this purpose any form of furnace can be used in which the flow of air and of the products of combustion is susceptible of regulation.

#### Restraining the Carbon.

In white cast-iron the aggregation of the combined iron and carbon molecules is extremely close, as indicated by the density of the iron, and in the treatment of such iron the inventors subject it to a temperature at which the two solids, iron and carbon, become soluble in each other, this temperature being much below the point of liquefaction, but being continued for a considerable time. The compound molecular aggregates being dissociated into simpler molecular forms, and these again into their atomic constituents, the atoms rearrange themselves into new molecular aggregates, the final arrangement being the permanent separation of the greater portion of the combined iron and carbon, while the pressure under which the dissociation takes place prevents the free carbon from passing into higher complex molecular aggregates—that is to say, the pressure compels the carbon to remain in its simplest form of atomic aggregation and restricts the physical dimensions of the carbon molecules, which are in an amorphous condition and hence distinguished from the graphite of cast-iron. This amorphous condition is evidenced by the fact, demonstrated by analytical tests, that the carbon in their castings has a specific gravity of about one and eight-tenths, a calorific power of about eight thousand heat-units, and a specific heat of about twenty-four hundred ten-thousandths, and therefore answers the conditions which are recognized as distinguishing amorphous carbon. Some variations are recorded in regard to these figures, depending upon the varying character of the iron before treatment, but in all cases the carbon, as to the properties named, resembles amorphous carbon and is as to said properties materially and demonstrably different from the graphite of cast-iron, whether the latter be ordinary or malleable cast-iron. The separation of the carbon in this peculiar manner is due to the temperature and pressure under which the separation takes place, the pressure within the solid at the temperature of treatment being many times greater than that at which the dissociation of the combined iron and carbon molecular aggregates takes place in molten iron, and the change taking place during a rise of temperature or during a long continued stationary one substantially stationary temperature, while in ordinary gray cast-iron the changes take place during a fall of temperature and in a short space of time.

#### Chemical Results of Process.

In producing iron castings in accordance with the invention the carbon passes from a combined into an amorphous graphitic state little by little, the action proceeding gradually throughout the mass during the continuance of the treatment. The molecular changes take place without any marked deformation of the physical shape of the castings, although small changes in physical form

generally occur and are apparent in altered density of the body.

In preparing iron castings the inventors find it sufficient in most cases to raise their temperature to about fifteen hundred degrees Fahrenheit and to continue the treatment for about two hours, although a higher temperature and a longer treatment may be required where the original white-iron castings are of a particularly dense character.

The chemical difference between the original white-iron casting and the same kind of casting after treatment is shown by analyses to be very considerable, the proportions being changed from figures approaching those above given as desirable for the white iron, as follows: Combined carbon from 2.96 to 0.73; graphite from 0.48 to 2.71; manganese from 0.136 to 0.104; silicon from 0.903 to 0.837; sulfur from 0.208 to 0.172, and phosphorus from 0.084 to 0.080.

#### Classified as Iron-Steel.

Speaking about the classification and utility of the treated castings, the inventors say that while they may be considered a special form of gray cast-iron in which the graphite is in an allotropic but not identical form with that in gray iron, they possess so many unique physical qualities that they are considered a new commercial product standing midway between iron and steel and uniting in themselves the best characteristics of both. They have none of the characteristics of white cast-iron, but in their stead the specific gravity and softness of gray iron, together with the malleability and susceptibility to forging and welding which are characteristic of soft steel, the strength and tenacity of a steel casting, and the hardening and tempering properties of high-carbon steel, this hardening and tempering quality, which marks the difference between castings by the new process and ordinary iron or steel castings, being a peculiar characteristic, which renders the former suitable for a large number of purposes for which expensive high-carbon steels are now employed.

#### Capabilities of the Product.

As indicative of the possibilities of the process it is mentioned that the casting referred to in the analysis above given was softer than soft steel, presented a soft and mossy fracture in which the graphite was quite apparent, could be plated out while cold to double its original size, was drawn out into a file-tang, made a sound weld at full yellow heat, hardened in both oil and water, and could be made to take temper by color, while its tensile strength was increased from about sixteen thousand pounds to the square inch in the original white-iron casting to about fifty-seven thousand pounds to the square inch in the treated casting.

The existence of carbon in the treated iron in the free or graphitic state greatly adds to its durability for all purposes where friction plays a part, and hence renders the castings of special value for the manufacture of gear-wheels or other parts of machinery subjected to excessive friction.

#### Strategy of Tire Makers.

At the English cycle shows, which are now in progress, the tire and accessory makers, following a custom which years of practice have accustomed the trade to tolerate but not approve, are paying smart prices for the questionable privilege of fitting bicycles with their goods and making conspicuous announcement of such equipment. The value of the practice is challenged for the reason that the public, through the assistance of the daily papers, is already acquainted with the purpose of the strategy and entertains grave doubts touching the probabil-

TRADE MARK

# To World Agents

For 1899 Arnold, Schwinn & Co. will make the DUNLOP DETACHABLE TIRE their regular equipment upon the World Bicycle, at no additional wholesale or retail charge.

## The American Dunlop Tire Co.

134 Lake Street, Chicago, Ill.

Belleville, (North Newark) N. J.

TRADE MARK

Mention The Cycle Age

“They are after you, Mr. Bicycle Manufacturer.”

WHO?

Our Travelers!

They are *looking for all manufacturers who are looking for the best* in our line. We *don't make cheap tubing* for use in cycle construction and *don't believe* any bicycle manufacturer who makes a *good wheel* and *stands behind* it will consider seriously the use of *inferior tubing* for one minute.

# “SHELBY”

is made from the *highest grade Swedish Charcoal Steel* that can be obtained. “SHELBY” has the *capacity and equipment* to meet *all demands*. “SHELBY” has the reputation of *making tubing* of the *highest standard*. Catalogues and further information on application to our offices.

NEW YORK, N. Y.

135 Lake St.,  
CHICAGO, ILL.

29 Constitution Hill,  
BIRMINGHAM, ENG.

Mention The Cycle Age

ity of the bicycle maker ever furnishing the advertised equipment with his machines. One live house is paying \$3 for every pair of its goods shown on new models, provided no other lines are exhibited. When the bicycle maker fits his machines with more than one form of tire, but still uses that one on three-fourths of his exhibits, he is paid \$2 a pair. Bicycle makers fitting half of their models on exhibition with one tire are entitled to \$1.50 per pair.

### REPAIRING STOLEN BICYCLES

Lawful Owners May Recover Property Without Paying for Repairs Ordered by Thieves.

Recently a stranger left a bicycle in the hands of a Massachusetts repairman, with an order for a general overhauling and a new pair of tires. A resident of a neighboring town proved beyond a doubt that the machine was his, it having been stolen the day before. The owner demanded his bicycle, refused to pay for the work which had already been done upon it, and curtly informed the repairman that he could look for payment to the man who had ordered the job. The repairman threatened to go on with the overhauling, fit new tires to the machine, and hold it until the rightful payment was made. Though, in this case, a compromise between the disputants was finally effected, a point is raised as to the legal right of the repairman to hold the bicycle—as stolen property—pending the payment for the repairs ordered by the thief.

It is a well recognized principle that the owner of stolen property, such as a bicycle, may take means to recover it wherever found, even though the possessor has innocently paid value for or put out work upon it. The owner of the bicycle would be entitled to its return, if he demanded it under these conditions, without paying for the repairs which had been made without his personal order, request or knowledge. In speaking of the lien of the artisan, in which something of the same principle is embodied, the law says: "In order to charge a chattel with this lien, the labor for which the lien is claimed must have been done at the request of the owner, or under circumstances from which his assent might be reasonably implied."

While this is the general law, it would appear that, in a particular case like the one quoted, if the bicycle actually needed the repairs made upon it, and was properly repaired, and the charges were reasonable, the owner of the machine, in demanding it without paying for the repairs, would be using a wise general rule of law for the purpose of obtaining the benefit of another person's labor without paying for it. A common sense of justice would prompt the average owner of a bicycle to pay cheerfully for work laid out upon a machine, especially by the man who should be the means of restoring his mount to him; though it is not to be doubted that there are those who would not only fail to remunerate a repairman for his services in the restoration of the machine, but seek to escape the payment of a just and reasonable bill on a slim legal technicality.

### Growing Popular in India.

Cycling in Calcutta is making extraordinary progress and the large number of local cyclists is expected to be greatly augmented during the forthcoming season, which is just opening now. At Howrah, too, cycling is advancing by leaps and bounds.

### War Revenue Decisions.

Washington, Nov. 21.—The following rulings made by the Commissioner of In-

ternal Revenue under the war revenue act are of interest to the trade:

Bills of lading for the export of goods, if made out in sets of two, each having equal value, and each being considered an original bill, both should be stamped.

Where a tax of 10 cents is paid on the bill of lading for goods exported, it is held that no stamp tax is required to be paid on copies of such bills of lading.

On inland bills of lading each duplicate requires a stamp of the value of one cent.

Bills of lading for exportation by railroad to British North America require a 10-cent stamp.

It is the duty of carriers to issue a bill of lading or receipt for goods accepted by them for shipment, and to affix the stamp, and a penalty is prescribed for failure to do so.

### DABSTERS IN CONSTRUCTION

Small Builders Sometimes Show Lamentable Ignorance or Carelessness—A Chicago Example.

Notwithstanding the fact that many of the smaller builders throughout the country are fairly good mechanics and turn out first class products from a standpoint of workmanship, there are still plenty of them who occasionally break loose into some inventive strain and turn out something which, while it may be constructed with the greatest care and in the best manner possible, is laughably absurd in construction or design. A recent example of such a thing is the arrangement shown in the accompanying

illustration. The device was put on a bicycle by a Chicago repairer who builds quite a number of first class machines. Whether the idea of the contrivance was originated by a customer or whether the builder himself is responsible for it is not known, but it is true that the maker had the completed machine in his show window.

For some unknown reason the machine was constructed too long to have the handle bars in the usual position and so in order to bring them back toward the rider a second steering head was placed on the top rail of the frame about six inches to the rear of the regular head. From the top of this head were supported the handle bars. On the bottom of the head was swung a sprocket, the mate to which was on the upper end of the front steering head stem. As the back sprocket was about three inches below the front one, the chain which ran around the two could not be continued as a unit and so short chains, one around each sprocket, were connected with light rods, tandem fashion. These rods were cranked to allow for the difference in planes between the two sprockets. Of course the steering connections will operate, but to think that two sprockets so close together and one about three inches below the other could be connected by chains and cranked connecting rods in a way that would furnish rigid and smoothly operating steering is absurd. A quick turn of the bars in order to get the machine out of a rut or around a suddenly discovered obstruction would cause the chains to jump the sprockets as there is nothing but the light rods to hold

them in their proper positions and the distance between them is so short in comparison to the distance between the two planes that there is no chance for the sprockets to adapt themselves to sudden emergencies.

### Operation of the Bankruptcy Act.

In spite of the failure of the Supreme Court to hand down the rules, forms and orders provided for by the Bankruptcy act, the courts throughout the country have accepted jurisdiction of involuntary petitions and are proceeding with all the preliminary steps, at least, as though the full code had been provided. In certain jurisdictions where the courts had refused to act upon voluntary petitions these tribunals have also declined to proceed with involuntary cases; but it is also true that in certain of these jurisdictions the courts, upon second thought, have appointed referees and referred both voluntary and involuntary petitions. No information has yet come to hand of a case in which the court has been able to grant hearings and take all necessary testimony for the adjudication of an involuntary petition filed against a debtor claiming to be solvent, but it is understood that such cases have already been acted upon, the alleged bankrupt proving his solvency and securing his discharge.

### Profits of German Makers.

A bicycle making concern in Dresden has just declared a profit of \$30,700, out of which the stockholders were paid a dividend of 9 per cent. This is by no means an exceptional case; on the contrary, a great many concerns have already paid larger dividends on their capital stock. The news is instructive, for it proves how little real foundation there is for the belief that German cycle makers are so industriously spreading that the customs tariff on cycle imports should be heavily increased. Nor have the German cycle fittings makers any just cause for complaint, on the score of profitable occupation, if one may judge from the success of one rather small establishment making parts which in the past season declared to government officials that it made a profit of \$80,000.

### Selling Bicycles in Brazil.

American bicycles have preference over all others in Brazil. Trade is best procured by having experienced commercial travelers, who can speak the Portuguese language, make trips about six months apart, and by paying strict attention to their orders and directions. Usually "something just as good or similar" will not please this people. The lack of a very small and apparently insignificant part of a machine renders the whole thing useless, and sometimes three to six months are necessary to replace it. These things should be kept constantly in mind, and the greatest care exercised to see that each shipment is complete in itself.

### Profitable Side Lines.

Cash registers and graphophones have been added to the side lines carried by the well known retail firm of Collister & Sayle, in Cleveland, O. Early this year the concern made a considerable purchase of golf clubs and met with such success in their sale that it soon became necessary to invest afresh. The profit on these goods was in percentage far above that usually obtainable from the handling of cycle sundries. Now the firm has secured territory for the sale of cash registers, and is hard at work inducing dealers to push these goods. The graphophones will be distributed in drug and cigar stores in Cleveland.

# Stearns Bicycles

**M**ESSRS. E. C. STEARNS & COMPANY desire to announce that their models for the season of 1899 are ready for inspection and that their full force of traveling salesmen are now engaged in covering the territory assigned them, comprising the entire United States and Canada.

Each 1899 Stearns bicycle is new, distinctive, elegantly finished and equipped. The complete list is as follows:

MODELS	WEIGHT	PRICE
Chainless.....	26½ pounds	\$75.00
Ladies' Chainless.....	27 pounds	75.00
Cushion Frame for men.....	23¾ pounds	65.00
Cushion Frame for women.....	25¾ pounds	65.00
Special, 30-inch wheels.....	21¾ pounds	65.00
Special, 28-inch wheels.....	21½ pounds	60.00
Ladies' Special.....	23½ pounds	60.00
Track Racer.....	20 pounds	60.00
Model E.....	24 pounds	50.00
Model F.....	24½ pounds	50.00
Combination Tandem.....	45 pounds	75.00
Diamond Tandem.....	43 pounds	75.00

## EQUIPMENT

### TIRES

Models E, F and Tandem, Hartford No. 80.  
Other Models, Palmer.  
Options, Kangaroo and Morgan & Wright.

### SADDLES

E, F and Tandems, Garford 156, 158 and 161.  
Other Models, the above with Sager Flexible,  
Christy and Stearns Rawhide.

## CHARACTERISTICS

Light Weights.

Narrow Tread.

2¾-inch Drop.

The works of E. C. Stearns & Company are operated continuously. They are never "closed down" except Sundays and holidays.

A large number of 1899 Stearns bicycles are completed and ready for shipment. During the season of 1899 all orders will be promptly filled.

The "advance" catalogue is now ready for distribution. It describes in detail the most attractive line of bicycles E. C. Stearns & Company have ever produced.

The trade on the Pacific Coast supplied from our branch store, E. C. Stearns & Company, 210 McAllister Street, San Francisco.

**E. C. STEARNS & COMPANY**  
SYRACUSE, N. Y.

The trade in the Dominion of Canada supplied from our Canadian factory, E. C. Stearns & Company, 67 Adelaide St. West, Toronto, Ontario.

## RECENT PATENTS

## Central Draft Oil Lamps—Rear "Boudard" Gear—The Searls Slotted Tee Post

**Barr's Brake.**—The brake shoe is of considerable length and is trough-shaped. It is hinged to a supporting plate by a pintle rod which projects on both sides to form foot pieces. The supporting plate is hinged at its rear end by a pintle to the upwardly extending horns of clamps which are fastened to the front forks of the bicycle. This pintle carries a spring which engages with a hook on top of the brake shoe. The clamps are fastened by screw and nut, the latter being extended to form coaster foot-rests and the screw-heads are flattened on one side in proximity to the upturned end of the clamp plate to prevent rotation of the screw. When the brake is operated the brake shoe and supporting plate first swing about the front pintle, so that the front of the brake shoe is first brought into contact with the tire. Further downward pressure of the foot causes the brake shoe next to swing at its joint with the plate, so as to lower the rear end of the brake shoe, bringing the whole length of the shoe into contact with the tire.

When the pressure of the foot is released, the spring lifts the brake, lifting first the rear end of the brake shoe by swinging the shoe about the joint with the supporting plate and then swinging both the brake shoe and the supporting plate about the front pintle, so as to lift the brake shoe clear of the tire. The brake may be operated as a hand-brake as well as a foot-brake by connecting the supporting plate to an ordinary hand-brake lever. The inventor is J. H. Barr of Ithaca, N. Y.

**Saddle Post and Clamp.**—The object of the designer has been to provide for an extensive range of adjustment of the saddle, with especial view to making horizontal adjustment of the saddle in its relation to the frame of the bicycle without changing the saddle tilt, and vice versa. The seat post has instead of the usual tubular L or T a top piece formed with a slot, as shown. The lower faces of this top piece are beveled and form a shoulder. The clamping plates are shaped to bear against the beveled faces and the top surface of the piece and may have curved grooves to hold the customary double saddle wire spring. A clamping bolt passes through the plates and the slot permits both plates and the bolt to be moved horizontally when the bolt is not tightened. The other construction

shown in the drawing illustrates the modified form used for securing a saddle provided with one flat spring. In this form the clamping plates have guiding lugs for the bolt extending into the slots on both sides of the bolt aperture. The illustration shows middle portion of the bolt broken away to indicate the position of

the guiding lugs. The inventor is W. A. Dickinson of East Orange, N. J., assignor to Searls Mfg. Co. of Newark, N. J.

**Puncture Repair Tool.**—This device belongs to the class of repair tools with which rubber bands are used for filling the puncture. The operation is described by the inventor as follows: "In carrying the device into operation I take a rubber band larger or smaller, according as the puncture is large or minute, and place one loop of the band on one side stud, then stretch the band and carry an intermediate part thereof between the nibs of the hollow stem, and then pass a bight of both strands over the other side stud, returning an intermediate part of both strands again between the nibs, passing a second bight over the stud first engaged and returning the extremity of the strand back again between the nibs and engaging the other end loop with the opposite stud. The band may be so stretched as to permit of a greater number of doublings, so that there will be as many strands extending from the crotch of the nibs upwardly to the engaging stud as may be deemed advantageous to accord with the character of any

given puncture. The rubber is then wet to enable it to easily pass through the puncture and the stem is inserted for such a distance that the cementing orifices are carried beyond the inner wall of the tire. The cement is then injected, issuing through the orifices and becoming sufficiently incorporated on and within the several strands, and then the spring levers are operated so as to cast off the

loops of the rubber from the studs. By quickly withdrawing the stem, the looped ends of the strands which fill the puncture are left in compact bunches. The cement introduced in the manner explained fills the interstices between the strands which pass through the puncture and also, with the bunched-up looped ends on the interior of the tire, forms a homogeneous mass, which effectually prevents all leakage of air."

With the tool may be provided a straight rod to be forced down into the tubular stem from the top to or beyond the orifices for the purpose of clearing the tubular stem of any cement which may have been left after the collapsible or other cement-containing can or tube has been detached. The inventor is C. C. Call of Springfield, Mass.

**Central Draft Lamp.**—The fount is reversible in the lamp body, allowing the lamp to be attached to either fork side of a bicycle without interference between the wick-shaft and the spokes of the wheel. The oil fount has a concave bottom which acts as an air pocket and a neck on top to which the wick tube is soldered extending downward into the fount. The wick-sleeve has barb teeth on its outside to assist in the even raising and lowering of the wick, which is bent around the sleeve. Opposite points in the sleeve are connected with a cross-

bar from which depends a rack-bar in which meshes the fluted or pinioned end of the wick-shaft, being protected from the oil in fount by passing through a small sleeve formed with the fount and passing entirely through it to the air pocket. A spring catch holds the wick-shaft securely against jars in any given position. The draft arrangement provides for a central draft through the wick-sleeve. Air also passes through holes in the depending flange of the lamp body, which is secured to a bead on the fount by a slip joint, thereby also holding the upper perforated section of the fount, which forms a draft plate, in position. The main portion of the air passes through these perforations in a sinuous course and is deflected inwardly toward the flame by the flared lower part of the chimney. A smaller portion of the air, however, finds its way downward through four tubes which lead from the top of the fount to the air pocket, and serves to steady the central draft air current. Between the central draft and the outer circular current the heated air and products of combustion are carried upward through the chimney as indicated by arrows in the drawing. The chimney which is shown in one part of the illustration has openings for sidelights and oval open-

ings in rear and front. The upper end of the chimney is screw-threaded to receive the chimney head which is formed with an internal screw-threaded flange, which extends upward and forms a wind guard for the purpose of preventing any outside current of cool air which might come through the perforation in the head from driving back the heated air and products of combustion arising from the flame. A cap is attached to the chimney head by riveted legs. The inventor is C. C. Armstrong of Columbus, O.

**Gear Casing Forks.**—The front sprocket wheel is inclosed within a casing, which is cast in one with the bottom bracket,

while the rear wheel is inclosed in a box-casing consisting of an inner half and an outer half. These two cases are connected together above and below by closed tubes, which are brazed in sockets of the front and rear casings and form together an integral part of the frame of the bicycle, and they also serve as a conduit through which the sprocket chain passes and by which it is inclosed. The rear stays of the bicycle frame are also secured by brazing to the inner rear casing. The outer rear box-cover is secured to the inner fixed half by screws or bolts and a vertical flange, as shown, so that it can be easily removed for gaining

which is screwed or bolted on to the front of it. The inventor is Z. H. Kingdon of London, Eng., assignor to D. A. McNeight of Liverpool, Eng.

**Compound Rear Gearing.**—The rear sprocket wheel is mounted in a bracket or sub-fork, being journaled in this bracket somewhat in front of the rear

wheel axle. It is of larger diameter than commonly used for rear sprockets and has internal gear teeth meshing with a gear pinion on the rear hub. The arms supporting the rear sprocket ring and internal gear are curved or dished as shown to permit alignment of the internal gear with the pinion. The inside branch of the sub-fork is bent so as to give room for the gear pinion between the axle and the periphery of the sprocket wheel. The object of the inventors is apparently to

provide a high gear which will run with small chain tension. The inventors are Enoch Haines and Robert Monahan of Lakewood, O.

William Bestie and William F. Bilger of Memphis, Tenn., have patented and assigned to J. J. Dupuy of Memphis and B. W. Arnold of Mont Vale, Va., an apparatus and a composition for repairing pneumatic tires. It consists in a bottle with an internally screwthreaded neck, intended to be screwed on to the inflation valve stem of a tire, when filled with a composition of glycerine, four ounces; fuller's earth, one half teaspoonful, and plumbago, one half teaspoonful, forming a black sealing fluid for the mending of punctures.

Patent has been allowed to Thomas B. Jeffery of Chicago for "a tire-cover in the form of an endless band or short cylinder consisting of a plurality of layers of bias fabric creased upon one surface to form parallel beads or ridges upon the opposite surface near the edges respectively, an additional strip or strips of adhesive fabric applied upon the creased side spanning the creases to render the beads permanent." The application for this patent, which is well known in its practical application, was filed January 26, 1894. French and English patents were granted for it in that year.

**New Agents Want Quotations.**

A new retail cycle firm which desires quotations from manufacturers is the Louis Vehon Company, 155 W. Jackson street, Chicago. The firm intends to operate on a large scale.

The total insurance on the plant of the Keystone Cycle company of West Reading, Pa., which was destroyed November 12 at a loss of \$60,000, was \$28,700.

**It Pays**

to keep the experienced riders on your side. Remember how many there are now, and how many more each season adds. Besides what they buy themselves, they practically do the ordering for the mass of new riders, who come to them for advice.

**Now what do the veterans want?** The very best of everything. The best of tires—they know what it is to have light, resilient tires under them throughout a long run. They know that cheap tires are dull and heavy—what they save the pocket comes out of the body—the extra effort required to drive them during a single day's run uses up enough bodily vigor to pay the difference in cost.

**League Tires help the rider.** Made of the finest Para rubber, not a grain of soft rubber or substitute in them, they dance with life and lightness. Specify them on your wheels; they "get there and get back," and good riders know it.

**LEAGUEKIT,**

the puncture doctor, mends single-tube tires. Makes quick and sure cement repair, or quick and sure plug repair—only tool that does the work of two kits at the price of one.

## CHOOSING USEFUL EMPLOYEES

### SELECTION BY TEMPERAMENT

#### Brain Size and Structure As an Index to Qualifications—Thinkers and Workers Distinguished.

It is quite evident that the matter of temperaments, as qualities of the human organism vitally affecting the nature of any work, and the amount of it accomplished, has been seriously underestimated by employers of all classes of labor. While it is impossible always to accurately gauge the personal character of an applicant for an office or shop position, or his capacity for work, by outward appearances, it is equally true that semi-reliable signs almost invariably display themselves in the person, to which indexes the astute employer can hardly afford to be oblivious or indifferent.

#### Fine Mind Indicated by Thin Face.

The first physiological sign to command attention is that of the brain, wherein it is quite possible for the novice in character judging to err, especially in the points of brain size and structure. Brains below a certain size, for instance, cannot exhibit much mentality and force, but the largest-sized brains, so frequently possessed by coarse, soft men, are usually equally deficient in these two most important respects. Fineness of mind is necessary to receive the best of impressions from the outer world. The mind of a fine-grained man or woman is like a carefully and skillfully prepared photographer's plate, instant to receive and reasonably sure to retain impressions from those thoughts, facts or objects capable of impressing them. A coarse-grained person receives infinitely fewer perceptible impressions than his finer-grained brother, and these are from the coarser and more material forms immediately surrounding him. A well-defined, lasting and profitable impression depends upon a power to make and a condition to receive it. Hardness seems to be a requisite to durability of impressions, as well as to good health and tenacity of life. The fine-grained and hard, thin-faced man often lives three times as long as the coarse-grained, full-blooded and full-faced man, to the great surprise of those who are unable to distinguish between fineness and coarseness (or fullness), between spirit-life and blood-life.

#### Hard, Coarse Men are Laborers.

Hardness and fineness are nearly synonymous. Softness is the complement of hardness, and, if we can so speak, negative to it. Too much of it is an index to physical weakness, to mental imbecility and shortness of life. Fineness and hardness are signs of vitality. Fineness and softness, on the other hand, are not long-lived. Soft fineness is different from hard fineness. Fine softness is different from coarse softness. Coarse, hard men are the lowest classes among physical workers, the men best adapted to come into immediate contact with nature's roughness and asperities, to clear up the forest, plow among stumps and stones, to operate the mines, to stand on the docks and breast all seasons' storms, make the irresistible and impetuous bayonet charge, etc. To them we are indebted for what human hands, unaided by mechanical science and art, has produced and constructed. The coarse soft men seem to be the least useful class, unless in the capacity of consumers, so as to keep the market good and prices up. They would not, if they could, and they could not if they would, accomplish a maximum of the best work, either with hand or head. Their softness

is a complement of the hardness of the coarse-hards.

#### Fine-Hards Mentally Powerful.

The fine, hard men are the most important in any department of business. They can think and work also, especially if they have some judicious coarseness. They have great power over both mind and matter, they understand the complex relations of life and govern their actions accordingly. The fine-hards comprise most of the hard thinkers, philosophers, inventors, scientists and especially the highest types of business men, who project and consummate works of great value to facilitate commerce and better human conditions. They are the men who set the coarse-hards to work, with their brawny muscles, sturdy resistance and sustained physical energy, to give form and structure to their thoughts, ideas and plans. They are to the world of mind what the coarse-hards are to the world of matter. The fine-hards are the head-workers, the coarse-hards the body-workers. The soft-fine have great mental and sustaining power of a certain kind, but they are liable to be too negative, yielding and unstable for the stern realities of practical business life.

### ERA OF ARDUOUS WORK

#### Brains and Energy at a Premium—Progressive Methods Ignore Sentiment in Business.

While it may not be a pleasant subject for contemplation, yet it is none the less a stubborn fact that never before have natural laws had such free play as now in the commercial world. Despite the inertia of ignorance and conservatism, the superficial interference of ignorant legislators and the short-sighted and impracticable schemes of enthusiastic reformers, commerce is being gradually freed from those shackles which have limited its scope and restricted its usefulness. There have consequently followed the free play of natural laws and the results of unrestrained competition. No longer is there any divine right in business nor any fostering care and favoritism which provide for the incompetent at the expense of the capable.

The new era puts a premium on brains and energy, on youth and strenuousness. It means that even long service and faithfulness cannot be an excuse for incapacity and imperviousness to modern ideas; that good intentions cannot supply the place of new thoughts, that concerns and men who are not "up-to-date" must give place to those who have learned to adapt themselves to their environments. It means, likewise, the steady appreciation of the standard of merit and the setting of a pace that already taxes our staying powers.

Those who have studied this new era the closest and believe in it the most are yet in the dark as to its ultimate outcome. It has much that is good, some that is bad, for it is the hard, the practical, the unsympathetic, yet withal the progressive side of business. Most of all, it is a fact, and as such will have to be accepted. Whatever its future may be, for it is yet only in its infancy, some things may be predicted of it with reasonable certainty. Its solution will be the outcome of the application of all the elements of human nature, not merely the selfish ones, for the ethics of trade will never be simply those of a pack of wolves, and its solving will embrace that of many of the economic problems that now perplex us.—Iron Age.

For some time past British India has been flooded with circulars issued by fifth-rate cycle merchants in England offering to supply high-class bicycles at low prices. The Indian trade has issued a warning to people contemplating the purchase of these goods.

## DOINGS OF STANLEY BROTHERS

### REGULATION OF GASOLINE FLOW

#### Steam Pressure at Instant Command and Automatically Controlled After Fire is Lighted—Racing Vehicles.

An invention of the utmost importance in mechanical carriage propulsion has been brought out by the Stanley brothers of Newton, Mass., in connection with their labors for producing an ideal steam road wagon. Hitherto the gasoline fired steam boiler has been always liable to flooding the burner with fluid gasoline, so that a conflagration followed the lighting. By simply changing the course of the gasoline supply pipe leading from the gasoline tank to the burner, the Stanleys have made it impossible for fluid gasoline to ever enter the burner. Nothing but the vapor of gasoline can enter the burner, and hence there is no possibility of lighting a puddle of gasoline, instead of setting fire to the expected small jets of gasoline vapor.

#### Weight and Power of Engine.

The result of this modification is that the Stanleys now have a steam boiler weighing less than a hundred pounds which will supply a pair of steam cylinders 2½-inch bore by 3½-inch stroke, cut-off at 9-16, at 822 revolutions per minute, the boiler pressure being 140 to 150 lbs. per square inch. These incredible figures are correct, as they represent the actual performance of the Stanley wagon at Charles River Park, Boston, Nov. 9, 1898. This Stanley steam boiler can be left for any length of time after the fire is lighted, with the certainty that it will neither reduce nor increase its pressure, nor will it blow off any steam; the boiler acts alternately as a steam generator and as a surface condenser, when the wagon is standing, and no steam is being used, the Mason regulator controlling its action perfectly. The practical result of all this is, that the driver can leave his Stanley wagon for an hour or two hours, with the certainty of having a full head of steam ready to use when he returns. The only failure possible occurs in case the gasoline tank becomes empty; when the fuel supply ceases the mechanism simply becomes inert, and that is all. The water cannot run short in the boiler while the engine is not working, because there is no escape of steam at the safety valve. When the steam pressure is above the regulator limit, the regulator turns cold air through the 300 thin copper tubes, and the boiler pressure quickly falls. Then the regulator slightly increases the fire, and so on, the pressure in the boiler not varying a pound, no matter how long the engine stands still. After the fire is once lighted the source of power needs no more attention, and the driver has precisely the same control of the situation that the motorman of a trolley car has; he has a full supply of power by simply moving a lever. The glass water-gauge is in full view, and hence in case of failure of the pump to work the driver is at once informed.

#### New Styles of Stanley Wagons.

The Stanleys have decided that 510 lbs., which was the weight of the carriage run at Charles River Park, driver off, is too heavy for a two passenger carriage, and they are now completing a 470 lbs. wagon, which they hope will constitute their commercial model. The two-seated surrey, to carry four passengers, is nearing completion; this vehicle will weigh 450 lbs. They also have under construction a racing wagon for one passenger which will weigh, empty, 250 or 275 lbs. This wagon will have the same engines and boiler used with the heavier vehicles, and the Stanleys are confident that

with one passenger only, flying start, this carriage will reach unexampled speeds. Except that the Stanley wagons demand a considerable supply of water, they very nearly fill the requirements of the motor vehicle for all around utility, and give promise of extended use as soon as they can be supplied, and as the makers of these wagons have lately abandoned their somewhat absurd contention that patents are disgraceful things, and have announced their intention to protect themselves as fully as possible, the establishment of a large factory for the construction of Stanley steam wagons, seems to be assured, as well as a continuance of the highly successful labors of these two brothers in the field of effort which now absorbs their entire attention.

HUGH DOLNAR.

**Whitney Wagon Steering Lever.**

A not very good photograph led to a misrepresentation of Whitney's novel and ingenious steering lever, on page 16 of the Cycle Age of Nov. 3, 1893, the throttle crank and rod being omitted. In the engraving given herewith these parts are clearly shown. The small crank on top of the curve of the lever at the left is spliced to rotate with the spade-handle grip, so as to open or close the throttle valve by means of the long slender connecting rod leading downward from the

crank to the machinery under the foot-board. The grip has a fore and aft movement for reversing the engines, but the throttle crank shaft, being spliced to the grip shaft, does not partake of the fore and aft movement of the grip, but is affected by the rotation of the grip only. A very small arc of vibration of the throttle crank suffices to fully open or close the throttle valve, so that this movement does not cause any inconvenience in operating the steering lever by the slightly rotated grip.—HUGH DOLNAR.

**Found Tire Plugging Difficult.**

A Chrisman, Ill., dealer writes to Cycle Age as follows regarding the trouble he has had in plugging punctures and mending rents in low-priced single-tube tires, and the means he has adopted for making them serviceable as double-tube tires:

We conduct quite an extensive repair shop for a country town, doing nearly all kinds of repair work that comes in our line, and while we have had some trouble with the construction of cheap wheels, our greatest trouble was with the tires with which these wheels are fitted.

We found it nearly impossible to plug even the smallest puncture without tearing the tire, compelling us to resort to the vulcanizer. We cite one case in which a tire exploded, tearing a hole large enough to place two fingers in. We have converted a number of these tires from single tube to double tube by cutting a slit in them, inserting an inner tube, sewing them up, etc., similar to the double tube cemented tires.

A. E. Schnitker.

Custom neglected is custom lost.

**FRONT OR REAR WHEEL DRIVE**

**DURYEA ADVOCATES THE LATTER**

**Bad Roads and Front Load Incompatible—  
Rear Steering Slow—Chain Wear  
Avoided by Casing.**

Peoria, Ill., Nov. 15.—Your interesting article on "Road Contact of Wheels" has been read with pleasure. The motor vehicle business is so new that everybody is more or less feeling his way along in the dark. Each maker views the problem from his standpoint and in the light of his experience, and is not to be blamed for errors he makes, when he does the best possible. In the article referred to the question of front or rear driving was brought up, and the writer assumed it to be a debatable question. As a matter of fact it is not so. Any motor vehicle to sell on the American market must be able to traverse the average American road as it now exists. We cannot wait for better roads, because roads, like other things, are not changed until a demand for change exists. This demand the bicycle has started, and the motor vehicle will follow up with a most efficient second. But the vehicle today, in order to be practical and salable, must take these roads as they are. Hardly a day goes by in muddy or freezing weather but what we find places where the greatest possible traction is required. Our vehicles being very light weight and very heavily powered do not find themselves short of power, but they do find occasional places where traction is lacking. For example, a steep, muddy hill will permit the driving wheels to slip in the slight effort required to propel the steering wheel or wheels forward. In a case like this forward drivers would be simply helpless. If they carried sufficient weight to enable them to get up such a hill, the vehicle would take a header in attempting to go down it. We use rear drivers and place the weight very largely thereon, so that in hill climbing just sufficient weight is carried by the forward wheels to insure safety against upsetting backwards.

**How Steering is Affected.**

If makers use their vehicles on level streets only, this point does not come up, but if they are building vehicles to be sold throughout the country broadcast, it is certain that they cannot be front drivers. A further objection is found in the fact that front drivers are usually rear steerers, and a rear steering vehicle is not so comfortable as a front steerer. Any of the old school cyclers, who used rear steering tricycles, will bear witness to this fact. The rear steering vehicle must have its steering wheels turned in the wrong direction first, and then follow the forward wheels in the right direction. To get out of a car track they must first cross the rails to the wrong side, and afterwards to the right side. This method may serve very fairly for slow speed rigs, but if the motor vehicle is to supersede the horse it must be capable of greater speeds. The public expect this, most motor vehicles now on the market give it, and the future motor vehicle will not be a success without it. So, if there were any question as to front or rear driving, the objections against rear steering alone would be sufficient to settle the matter.

In the same article the question of pivotal construction for the front axle so as to permit vertical movement of the wheels was introduced. This system was tried by the Duryea Bros. in their earliest vehicles, but was afterwards abandoned, as being a costly, complicated and unnecessary construction. Ordinary horse vehicles run for years over all kinds of roads and without this construction, and the motor vehicle properly built can do likewise. While it is true that lifting the load requires power, it is also true that over ordinary roads this difference is not sufficient to be worth considering. The motor vehicle must of necessity be used by people having no previous experience therewith, and simplicity and reliability are greater features than slight additional economy, for the cost per mile is so much less with any motor vehicle than with horse vehicles that questions of economy do not arise.

**Chain and Gears Incased.**

A queer admission is made in the latter part of this same article regarding the twisting effect of the motor vehicle on the roads. In the first place, the axle is pivoted horizontally to avoid twisting, but, secondly, the chains are believed to be worn out because of the twisting effect. From the writer's experience with chain driven vehicles, he is convinced that the fault is elsewhere. Duryea vehicles are running every day, using chain drivers, and the chain is not giving any trouble. Of course, the chains are made as finely as possible, being our own design and made to our order. They are also cased, to protect them from the ever-flying dirt and

mud, and are self-oiling, so that they do not wear perceptibly.

Chas. E. Duryea.

Mr. Duryea overlooks that the writer of the article to which he takes exception distinctly states that he personally ascribes the excessive wear on the chains of the steam vehicle described by him to the absence of casing and not to twisting of the chain. On the other hand, he does not state definitely whether the pivoting of the front axle by which Mr. W. E. Whitney has aimed to avoid twisting was a feature of those wagons in the use of which excessive chain wear was observed, or is a recently added feature, which has not been in practical operation a sufficiently long time to determine its effect on chain-wear. The latter seems to be the most plausible inference as otherwise it might have been stated positively that the pivoting of the axle had or had not remedied the chain trouble. However, the point which Mr. Duryea evidently desires to emphasize is that chains are a good and durable driving medium, as used on Duryea vehicles, whatever they may have proved to be under different conditions. His reference to rear steering and its peculiar unsuitability to roads, furrowed by ruts and streets with car tracks, should be of considerable interest to the builders of vehicles.

**Emergency Brake for Vehicles.**

To escape injury to rubber tires on mechanical vehicles by sudden stoppage or reversal of power under speed a French inventor proposes the brake shown in the accompanying illustration. It will be readily seen that the brake shoe is designed to be dropped under the driving wheels so as to remove the tire from direct contact with the rough ground over which the vehicle may be driven when

brake service happens to be required. To disengage the brake when travel is to be resumed, it would seem to be necessary to back the wagon out from over the brake shoe, first. The inventor has apparently mostly the hard and flinty roads of Europe in view, as his arrangement will not lessen that portion of the stress on tires which arises from the sudden stoppage, but only the additional wear and tear which may be caused by roughness of the road.

**Better Times in Australia.**

It is generally conceded by even the most confirmed pessimists that the tide of prosperity in Australia long ceased its ebbing and is now steadily flowing. The lean years belong to the past. Business is distinctly good and is improving. Though July and August are usually dull months, there are those who are able to say that they were the best of the year to date. The change in the spirit of business men is perhaps more marked in New South Wales than in any other colony. In Sydney it is rare to meet anybody who does not look forward to the coming summer with confidence that it will prove the best since 1891. In Australia, as elsewhere, there are numbers who have missed their chances and will never regain lost ground, but there is also a whole generation who are now facing opportunity for the first time.—Australasian Coachbuilder.

# INFORMATION FOR BUYERS

## TOE-CLIP THAT SNAPS ON.

In the accompanying illustration is shown Griswold's Self-Fastening toe clip which is made by M. E. Griswold Cycle Specialty Co., 45 South Canal street, Chicago. This clip is fastened to the pedal by simply snapping it on the barrel and may be removed by a strong jerk pulling the spring clasp apart. While in use, however, it cannot come loose by any movement of the foot, as a small flap of the metal plate is hooked into the sideplate preventing the clip from vibrating around the barrel and thereby also preventing it from getting into the position where it may be pulled off. The clip is made from

THE CYCLE AGE

a single piece of sheet steel and will fit any modern rat-trap pedal except those which are excessively narrow between the sideplates. The Griswold company has special machinery for turning this clip out as inexpensively as consistent with the high grade of stock and nickel plating that the trade expect in toe clips. Each clip is carefully spring-tempered after going through the punching and bending process in which the blank receives its form and is guaranteed by the company not to buckle out of shape when roughly used. The manner of attachment to the pedal also serves this end, making it possible for the clip to yield sideways when accidentally bumped against a curb or an obstruction in the road.

## THE OLIVE WHEEL CO.'S MODELS.

Traveling representatives of Olive Wheel Co., of Syracuse, N. Y., are showing the company's new sets of models to representative agents throughout the country. Among the features of the patterns there are naturally no startling innovations, as the construction followed this year proved very acceptable to the trade, but the flush joint construction, seat post cluster design and triple fork crown are shown in the accompanying illustrations as examples of the individuality which has always marked the Olive company's production. It is noticed in the flush joint construction that the two dangers have been avoided which are the bane of indifferent cycle designers, that is, there is neither too much accumulation of metal by which the effect of shocks would be concentrated at the nearest comparatively weak point of the frame, nor is the

metal forced into sharp corners in the presses so as to violate its structure. "Sixteen ounces of quality for every pound of price" remains the shibboleth by which the company aims to enlist the cooperation of active agents.

## PEERLESS LINE FOR '99.

Twelve models constitute the complete line of the Peerless Mfg. Co. of Cleveland, O., for the coming season. Three of these are 30-inch wheel models, which will not be carried in stock, so orders must allow extra time for assembling. The Peerless road machines are made in three models—the regular 28-inch wheel machines in diamond and drop frame, listing at \$50, and the 30-inch wheel model for men only, at \$60. Triumph

roadsters are also in three models, similar to the Peerless, but retailing at \$35 for the standard sizes, and \$40 for the 30-inch. The Bluebird racer is in two models, the standard size being listed at \$65 and the 30-inch model at \$75. The double diamond tandem is catalogued at \$75 and the combination double-seater at \$85. All the Peerless machines are finished in plain black of exceptionally fine lustre, and good nickel plating, making a finish calculated to appeal strongly to the good taste of a class of purchasers which the company is pleased to cater to largely. The Triumph roadsters are finished in three popular colors—black, maroon and green—while the Bluebird racer is finished in a color suited to the name. The tandems are graceful and of comfortable lines, and the double diamond is built either double or single steering. The heights of men's frames throughout the line are 22 and 24 inches, with 26 as an option; women's frames, 21 and 23 inches. Stationary or adjustable bars of new and attractive design are fitted, and the equipment throughout is standard and desirable.

## ELECTRO GAS LAMP IMPROVEMENTS.

The general form of the Electro gas lamp, made by the Electro Lamp Co., 45 Broadway, New York, is so attractive and convenient that no changes have been made for the season of '99, except in minor details, which are nevertheless of vast importance in the perfect operation of an acetylene lamp. The water chamber has been made larger and the top opening is now arranged so that the lamp can be filled quickly without the opening stopping up with air bubbles. The valve is of a new pattern, and

THE CYCLE AGE

the company states that no matter how much the lamp may be jarred or jolted, the flame will not vary in size. It is also so arranged that the water passes directly to the carbide instead of dropping on the carbide, as it did in the '98 lamp, as the cartridge now fits up tight against the valve. The reflector is made of aluminum, it having been found that no matter how highly polished the nickel reflector might be, it would tarnish in a short time, and could not be cleaned. With the one made of aluminum, the tarnish can be rubbed off with a soft cloth, making it always bright and new looking. The reflector is fastened to the body of the lamp, instead of the neck of the water chamber, which makes it stronger in every way. There is no opening around the burner tip, as in the '98 lamp, which at times allowed the suction of the wind to take the gas from the tip, putting the lamp out. The bottom clamp of the carbide chamber is of the same pattern, but arranged so there is no leakage of gas. The bracket is much stronger in every way, and the company will also make a bracket for it to apply to cartridges. The most important new feature of the lamp is the carbide charge, which, owing to the carelessness of the average consumer, was allowed to deteriorate. The new charges are all hermetically sealed, and could be kept out of doors an indefinite length of time without the atmosphere affecting the carbide contained therein. With this lamp will also be sold a permanent charge, which will allow the consumer to insert the carbide himself, making it much cheaper if he desires economy rather than convenience.

## CLAMPS NUTS AUTOMATICALLY.

A wrench has been designed by C. J. Bonsfield of Bay City, Mich., which will clamp the nut to which it is applied by the automatic pressure of the hand in operating it. This is accomplished, as shown in the illustration, by arranging on a slotted bar with the outer jaw as its extremity, a second bar carrying an inner jaw and adapted to slide along the slotted bar. The sliding bar is provided with teeth or notches for forcing the bar forward by engagement with the

teeth of a cam pivoted in the slotted bar, when the cam is rotated by a lever which forms part of the wrench handle. The inventor believes that this wrench will do the work of a clamping wrench, by which marring of nuts is avoided, more effectively than any of the more elaborate affairs that have been designed for this purpose, so long as no heavier work is required than that incidental to the use or repair of a bicycle. He is preparing to place it on the market within a short time and will use such exceptionally good material that there will be no danger of breaking the cam teeth which

bear the heavy stress. This necessarily will make the wrench somewhat costlier to manufacture than other bicycle wrenches on the market.

## SPEEDER COMPANY'S MODELS OUT.

The Speeder Cycle Co. of New Castle, Ind., announce that they will have one of the most complete and finest lines of bicycles manufactured in this country. They have three different models, the Alcazar, New Castle, and Atlas. The Alcazar will be built in two models, with 28 and 30 inch wheels. They will be built of the very best material with triple crown, all crowns nickel plated, Fauber hanger, flush joints throughout, 3/4-inch drop to hanger, and seat post and handlebar expanders. The 28-inch Alcazars will list at \$50, the 30-inch at \$55. The New Castle will have diamond front fork, diamond cranks, and diamond lower and upper rear stays, flush joints, seat post and handlebar expanders. It will be one of the finest machines on the market, and will list at \$40. The Atlas will be a first class machine with 1 1/4-inch tubing in the diamond, flush joints, 2 1/2-inch drop to crank hanger, adjustable handlebars, with handlebar expanders, and will be up to date in every particular. It will list at \$35. These machines will be enameled in three colors, black, maroon, and olive green. The catalogue showing the complete line will be out in a very short time.

## THE ROUGH RIDER PEDAL.

Mackie-Lovejoy Mfg. Co., 60 N. Clinton street, Chicago, have placed a new pedal in the market, called Men's Rough Rider pedal, which is built to stand hard knocks. It is being sold alongside of the Arrow and

THE CYCLE AGE

Advance patterns which are well known to the trade, and is provided with the same style of interlocking cone and washer by which tightening and bending of pedal bearings are prevented on all Mackie-Lovejoy pedals. The illustration shows the design and construction of the Rough Rider. The spindle is drop-forged and thoroughly case-hardened. The bearings are dust-proofed by a screw-cap at the outer end and an annular spring washer at the inner end. It is made in rat-trap and combination patterns in both men's and women's sizes and is heavily nickel plated.

## ANDRAE TELEPHONES AND SUPPLIES.

A catalogue of telephones and electrical supplies has just been issued by Julius Andrae & Sons Co., of Milwaukee, which has been engaged in the manufacture of such

**Columbia Dealers Pleased.**

ST. CLOUD, MINN., Oct. 31, '98.  
POPE MANUFACTURING Co.,  
Hartford, Conn.

We are pleased to receive your circular No. 27 and to note prices you quote for 1899. We have always thought your prices too high to enable a dealer to compete successfully with other wheels, but with these prices you are now making and the line you are putting on the market, we feel that there is no use looking farther or handling any other wheel. Shall be glad to have your representative call on us as soon as convenient so that we may arrange for next season's trade, will probably want some sample wheels for holidays and trust we may increase the sale of Columbia and Hartford wheels as much in 1899 as we did in 1898.

Kindly let us know about when we may expect a call from your traveler.

Yours truly,  
THE GRINOLS' CO.,  
(Signed) C. D. GRINOLS,  
Sec'y & Treasurer.

DERBY, CONN., Nov. 15, 1898.  
POPE MANUFACTURING Co.

Dear Sirs: We are very much pleased with the last Model 50 Columbia Chainless and it was sold before it was in the window five hours. The price is such a decided change that people seem now to think that they can afford one who would hardly talk with you before. The wheel received is a perfect running one apparently so far and has given our customer perfect satisfaction and he is so pleased that he is constantly asking his friends to ride it. We expect to sell quite a number. We enclose an order for another Model 50.

THE HUNT PAPER CO.

MILLVILLE, N. J., Nov. 10, 1898.  
POPE MANUFACTURING Co.

Dear Sirs: I predict the season of '99 will be one of the largest in the history of your company, your prices are right and there is no doubt about the wheels being all right, especially the "Chainless." At the reduced price it should take the place of all high grade chain wheels.

W. G. HAY.

LEXINGTON, KY., Nov. 10, 1898.  
POPE MANUFACTURING Co.

Dear Sirs: "I have been riding a Chainless myself all the season and am free to say that it is without a doubt the nearest thing to perfection in a bicycle which I have ever ridden.

I have ridden this wheel since February and have never adjusted a bearing or put a drop of oil on it, and I think it runs smoother to-day than it did when I first began riding it."

SMITH, WATKINS & CO.

**Gold Medal at Omaha.**

The Pope Manufacturing Company were awarded the gold medal for bicycle exhibit at the Trans-Mississippi Exposition held in Omaha.

**The Chainless.**

(Joliet News, Nov. 4, 1898.)

The Columbia chainless drops to \$75 next year which will bring it within the reach of the west, and will make a big scatter in the bicycle world. There is nothing like it. A man on a chainless is a nabob. People treat him that way, and he feels that way.

In Chicago 215 were sold this year, the price being \$125, but next year will see a great change, for the wheel comes next to a steam engine. There was a feeling that it would not run as easy as a chain wheel, but that has not been the experience and the record smashing of the season shows it. The time from New York to Boston was cut five hours, and to Albany four hours and thirty-nine minutes. Teddy Edwards made 250 consecutive century runs during the year on the chainless, and the News editor has made Jim Flanders tired.

# QUALITY and PRICE

The rare combination of quality and price which we are offering in Columbia, Hartford and Vedette bicycles, has never before been approached by any other line. The quality of our wheels has been admitted for years, even by our competitors, to be unsurpassed. Their plea for business has almost always been that they offered something just as good as a Columbia or Hartford for less money. The force of that argument has been discounted by our 1899 prices. Columbia and Hartford bicycles for 1899 are better than any of their predecessors, which have stood as STANDARD during their respective seasons.

Here is QUALITY.

Here is PRICE.

Columbia Chainless,	-	\$75.00
Columbia Chain,	-	\$50.00 40.00
Columbia Tandems,	-	75.00
Hartford,	- - -	35.00
Vedettes,	- -	\$25.00 26.00

If you secure the Columbia Agency, you will be offering your customers the best bicycles to be had at prices but little more than the cost of the poorest.

Write to, or call at once on the Columbia Distributing Point in your territory. You will be sorry if your competitor gets the agency.

goods for the past thirty-eight years and was one of the first concerns to handle them in a retail way in connection with bicycles. Just now the company is using strongly their suitability for sidelines for cycle dealers throughout the country, and it reports meeting with gratifying success in its endeavors. In the introductory to the new catalogue the Andrae say: "Experience with poor telephones has increased the demand for the Andrae—because the Andrae is a good telephone. We do not say the 'best.' The word has been so misused that it has lost nearly all of its good significance. It seldom tells the truth and therefore we will not use it. It suggests rivalry, a factor which, in our case, is all upon one side, and therefore of no moment to us. We have had our own work to do

THE CYCLE AGE

and we have done it. Our work has been to attain the ultimate stage of telephone perfection. To this end we have employed busy brains and clever fingers. We accepted possibilities and returned realities; and now, in the Andrae, we offer the most ingenious and most carefully made telephone that mechanical skill, capital and energy can produce." The Andrae line of telephones includes three styles of standard exchange instruments with and without the adjustable arm for the transmitter; the standard long-distance and the long-distance, swinging arm desk instruments; the inter-communicating or warehouse instrument, designed to meet the requirements of extensive factories and office buildings and dispensing with the use of switch-board and operator; and the long-distance portable desk telephone, here shown, which is one of the many conveniences that science has placed within the reach of the busy man as he labors at his desk. A full line of telephone parts and implements for constructing and equipping complete lines of communication are also supplied by the Andrae company.

NEW NATIONAL MODELS.

In making its announcement to the trade the National Cycle Mfg. Co. of Bay City, Mich., states that it will stick to its old policy of selling direct to the dealer without the intervention of the jobber. Emphasis is put upon the intention of the com-

pany to protect the dealer in the matter of price maintenance, the channels through which the National is marketed, and the inviolable use of the National trade-mark. The line for 1899 consists of four new single machines, tandems being built to order only. Model 25 is the regular 25-pound roadster,

with 3-inch drop, 5½-inch head, 23-inch frame, with options of 22 or 25-inch frames; list \$60. Model 26, the only lady's machine in the line, is built with 22-inch frame and 3-inch drop, with option of 20-inch frame. The weight of this model has been reduced two pounds below that of '98; list \$60. Model 27, listing at \$65, is the 30-inch wheel which is

made at the special request of many of the company's old dealers. After making several experimental machines, Superintendent Wilcox decided that the closely built bicycle

was to be desired, and accordingly has produced a machine with 4½-inch wheel base and 23-inch frame. With 3½-inch drop and 7-inch cranks, it is a most suitable mount for the tall man. President Smith of the company says his 30-inch machine rides

easier and seems to fit him better than any other bicycle he has ridden. The National racer weighs 21 pounds and lists at \$75. It has 22-inch frame, 3-inch drop, 4½-inch head, light rims, spokes, hubs, sprockets, and chain.

CRUCIBLE STEEL IN WOLFF-AMERICANS.

With construction and design of the ablest cycle manufacturers extensively copied and imitated by makers of lower rank it is frequently noticed that a design which was excellent for the material in which it was first produced by the originator is thoughtlessly appropriated by others who embody it in material of a much lower grade. The result is trouble. In bicycle construction the result is breakage and frequent recourse to the repair shop. Low grade material must be designed and worked by original methods adapted for low grade material and not by imitation, if halfway acceptable results shall be produced. In bicycles the use of low grade material means either increased weight or danger of breakage, usually both. In all cases it means also much lessened durability. A certain assurance that the best material is used is today the best guarantee of high grade in bicycle construction. It guarantees good workmanship, for nobody would spoil good material by cheap work, knowingly. It guarantees good construction, because the construction which is imitated by all low grade manufacturers is necessarily that which was originally designed for the best material. That is the law followed by commercial imitators. It is with these points in mind that R. H. Wolff & Co., Ltd., of New York, draw the trade's attention to their exceptional position as producers of the highest class of crucible steel and wire. Being enabled to obtain at first cost a steel for bicycle work which is acknowledged to be the best for a multitude of purposes that come within the range of bicycle construction, they point out how this special position creates the only assurance of high class bicycle manufacture, which every thinking person must admit to be valid and genuine without discussion. They place the argument at the disposal of their agents as a valuable assistant for convincing customers that Wolff-American bicycles illustrate that important difference between high and low grade bicycles which frequently escapes the customers' ability for investigation.

REPAIR TOOL PRICE REDUCED.

The Sure Thing tire mender, manufactured by the Brown-Lipe Gear Co., of Syracuse, N. Y., which was sold extensively the past

season, has just been reduced 33-1-3 per cent in price, and will hereafter be mailed post-paid on receipt of price in stamps. The repair kit, as shown in the accompanying cut, consists of a slotted and grooved needle, package of rubber bands, and a vest-pocket case. The kit is for making quick repairs on single tube tires in emergency cases on the road, no cement being required, and a temporary repair being effected that is good

for several hundred miles of riding. The company is prepared to furnish electrotypes for jobbers' catalogues.

NEW STEARNS MODELS.

The advance catalogue of E. C. Stearns & Co., of Syracuse, N. Y., is just out. It shows outline views of the eleven '99 models of

Model E—Weight, 24 lbs. Price, \$50.

Model F—Weight, 24½ lbs. Price, \$50.

#### SMITH CO.'S THREE-CROWN PARTS.

Parts for three-crown bicycle frames are now being made in quantity by C. J. Smith & Sons Co. of Milwaukee, consisting of crank hangers, seat post clusters, rear crowns, rear forks and stays and rear fork ends for making the rear end of this style of frame in flush joints. All of these parts are made of sheet steel, the clusters being arranged to use with expanders. The forks and stays are tapered D-section, and fit onto the crown at the large end, and on the rear fork end at the small end. The crown is a new piece of the company's own design and is very light and strong.

#### WHEELER SADDLE COMPANY BUSY.

The Wheeler Saddle company's plant at Detroit, Mich., is now running full time in every department. The extraordinary demand for the company's model "Extra" has necessitated the putting on of a full force earlier than was at first contemplated. The Wheeler line consists of but four models—the men's and women's Extra, the Special roadsters, and the Cork-Top racer, all having "that curve" in the back and finished in the careful and stylish manner that has always characterized Wheeler saddles. Attempts have been made to imitate these popular goods, but reliable wheelmakers always prefer the genuine to an imitation, as is amply testified by the many contracts the Wheeler people have already secured.

Bigelow & Dowse Co., 229 Franklin street, Boston, has renewed its distributing agency for the Davis Sewing Machine Co. of Dayton, O., and will carry the full line of bicycles made by this concern, including the spherical hubs and hanger '99 model. In addition to this line it will handle in a jobbing way the B. & D. Special, Shawmut, Park Flyer, and the Fay juvenile bicycles, the last named being the product of the Fay Mfg. Co., which Bigelow & Dowse have arranged to represent.

Notice has been served by the Eclipse Bicycle company that a coaster and brake device is being made and advertised which it alleges to be an infringement of the Eclipse letters patent, and that unless the manufacture of such coaster and brake

ceases and the advertisements be withdrawn, the company will institute infringement proceedings immediately in the United States court.

#### TRADE NOTES.

S. K. Dingle has entered the service of the Mechanical Fabric Co., of Providence, R. I., which manufactures Emperor, Conqueror and Flexifort tires, and is now putting on the market a new tire called the Hobson, to meet the popular demand for a serviceable article at a moderate price. Mr. Dingle will make his headquarters with Wm. H. Sheldon & Co., selling agents for these goods, at 105 Reade street, New York.

The Lozier Manufacturing Company's branch in Toledo will move into new headquarters on Madison street for its local retail business. The building, which has just been erected, will be fitted up as a model bicycle emporium. Jack Swindeman will be in charge of the store and, besides, will have charge of the retail business in several counties adjoining Toledo.

Kelly handle bars and Kells saddles have been introduced successfully in England by Lew Keck, traveling salesman for the former, and Brown Bros., London, handling the latter, and the trade in those lines has taken on a satisfactory aspect, according to Charles Weaver, who jointly represents the Kelly Handle Bar Co. and the Kells Mfg. Co. in Cleveland.

The Hoffman Bicycle Co., of Cleveland, O., has completed its '99 models, and a fortnight ago started its traveling salesmen out on the road. Mr. Smith went east to cover eastern Ohio, New York, Pennsylvania, and the New England states. Mr. Dobbins will take in western Ohio, Indiana and Illinois, and a third man will cover Michigan, Wisconsin, Iowa, etc.

Hollinghead & Wirtz, 2 Stone street, New York, basing calculations on actual and prospective orders, anticipate producing upwards of half a million pedals this year, their capacity being 3,000 pair a day. Among their new contracts are large orders from some of the foremost bicycle making concerns of the country.

The Bridgeport Gun Implement Co., of Bridgeport, Conn., reports having in hand orders for 150,000 pair of Bridgeport pedals, which will tax its facilities in this line to the utmost. Additional orders for these pedals would necessitate their manufacture outside, which would mean added cost of production.

The Gendron Wheel Co. of Toledo has twelve men on the road. Since July 1 the concern has been working on '99 models and 6,000 of them are now ready for shipment. The Gendron company runs its bicycle department the year around.

J. H. Johonnot, formerly of the firm of Cramer & Johonnot, selling agents for the Barnes bicycles, in Buffalo, N. Y., has formed a partnership with E. B. Cassety and will soon open a store for the sale of Olive bicycles in that city.

Charles H. Weld has been made sales agent at Marshall, Mich., for Duckworth chains, the Cycle Tool & Mfg. Co.'s expander, seat-post cluster and one-piece crank-hanger, and for Otto Konigsloew's line of jobbing bicycles.

A. T. Wilson of Denver was in Toledo last week and closed a contract with the Union Mfg. Co. for 1,000 Vikings. He will have the exclusive sale of the Viking bicycles in Colorado.

The Shelby Steel Tube Company is putting in position at their Greenville mill the largest piercers in use in the world, large enough to pierce a billet 5 $\frac{1}{2}$  inches in diameter.

Charles Litzky and J. F. Rivers, constituting Northwestern Cycle Co., have secured the agency for Columbia and Luthy bicycles in Minneapolis and St. Paul.

E. P. Blake & Co., Boston, Mass., cycle dealers, have absorbed the business of H. Lorentzen & Co.

#### GAS LAMP REQUIREMENTS.

##### Mechanical Features Needed and Results Most to be Desired for Perfect Gas Lamps.

What should be the mechanical construction of the perfect gas lamp? What results are desired in operating a gas lamp in order to earn the designation "a perfect gas lamp"? Both questions are asked by the Frank E. Bundy Lamp Co., and answered by them in the following manner:

It is an undisputed fact that an acetylene gas lamp, of a size suitable for bicycles, cannot be constructed which will admit of the gas being ignited and extinguished in the same manner as an oil lamp, and be absolutely safe. As long as there is moist-

ure in the receptacle which contains the carbide, gas will be generated, and, if a lamp has a valve to turn the gas off, from the moment the gas ceases to have an exit the pressure rises, and while the lamp might be made strong enough to withstand the pressure, the results, when the gas is turned on again, would not be at all satisfactory or safe. So an impossibility cannot be considered a requisite for a perfect gas lamp. The following are the only mechanical necessities for a perfect gas lamp:

1. Treatment of the carbide by furnishing moisture through an absorbent and not letting the water attack the carbide direct.

2. Absolutely automatic regulation of the water, so that under no circumstances will any more water or moisture be able to attack the carbide than the operator intends to have, or than was intended by the manufacturer of the lamp.

3. Simplicity of construction and operation.

4. Size and weight consistent with the results desired, particularly the amount of light and reasonable minimum hours of burning.

5. No possible chance for gas to escape, except at the burner.

6. All parts interchangeable.

7. Handsome appearance and graceful proportions.

8. Carbide to be used in such a form that it may be quickly and in a cleanly manner renewed in the lamp, and be absolutely impervious to moisture until placed in the lamp.

The following are the results which are mostly to be desired, and which should be obtained, in operating a perfect gas lamp:

1. A reasonable amount of light.

2. At least five hours of burning at one time.

3. The lamp may be relighted and burned without renewing the carbide, if the lamp has not previously given the stated number of hours' burning.

4. Pure gas and white light.

5. The lamp should not get hot so as to prevent handling with impunity.

In many gas lamps a needle point valve allows the water to pass directly to the carbide, with no other feature to control the passage of the water from the water chamber to the carbide, so that when, by a sudden jar, the lamp is shaken, water is precipitated in a large volume direct to the carbide and a large amount of gas is generated, which passes through the burner with a huge flame and smoke, and through the water chamber and so out into the air, giving off the most disagreeable odor, and in some instances the gas is ignited at the wrong place, completely ruining the lamp, with injury to the bicycle.

The extent to which acetylene gas lamps are being made and used, and the absolute worthlessness of a majority of them, really calls for a government license, an examination before any lamp could be placed on the market, and no lamp should be allowed to be sold which did not come up to the standard and requisites as enumerated above. Piracy is common among gas lamp makers. This feature is stolen from one lamp and that feature from another, and a lamp is produced inside of a few weeks, without any thought or study as to its practicability and safety.

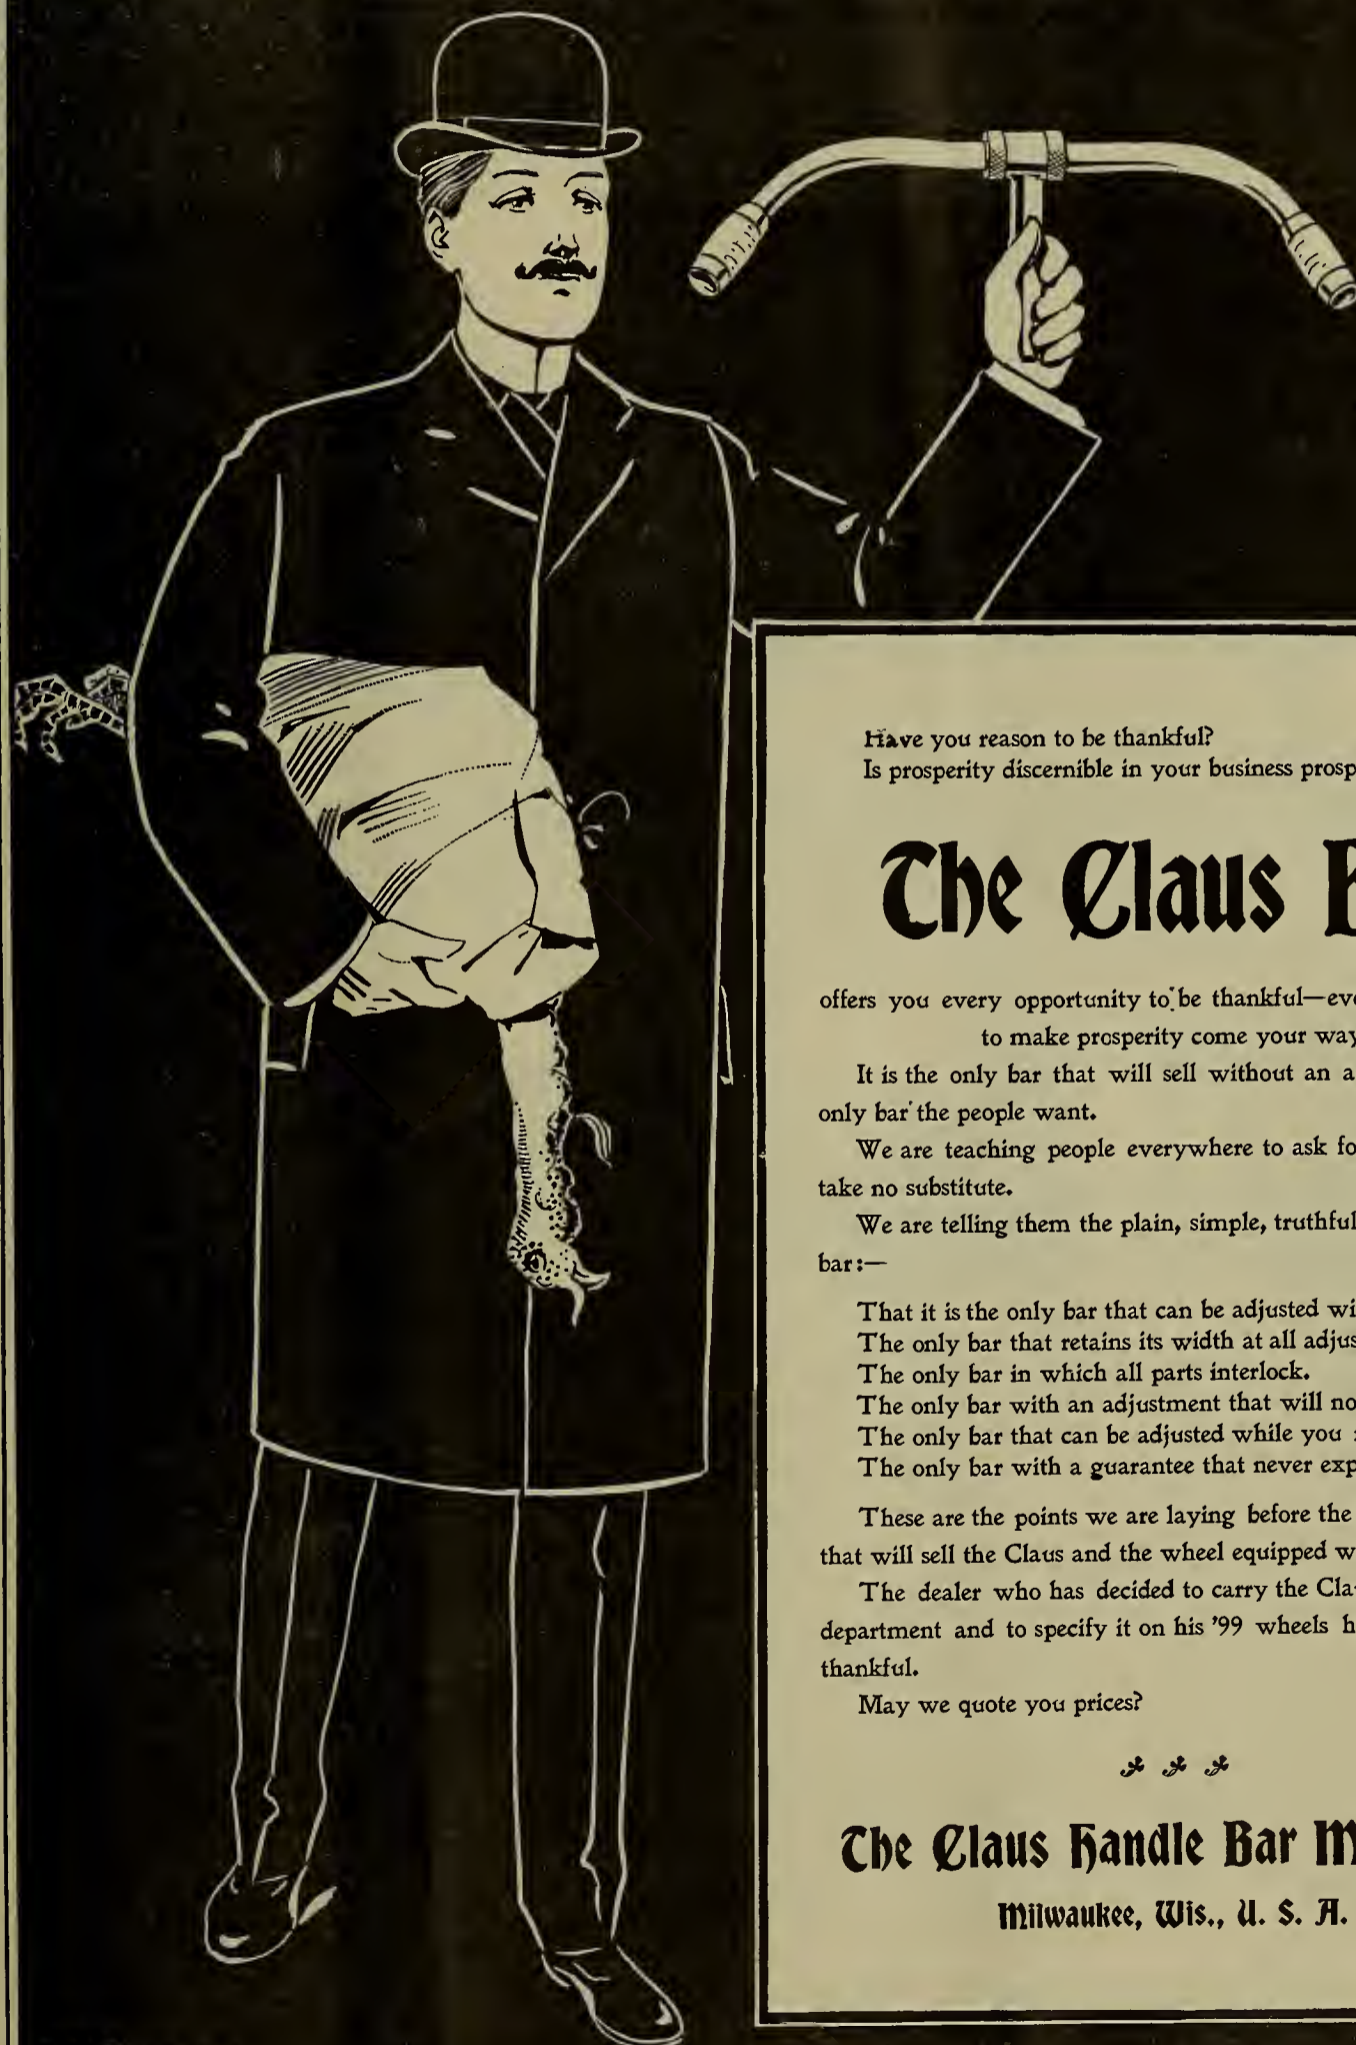

The Bundy lamp, produced after two and one-half years of experimenting and trial, is designed on scientific principles. The ease and cleanliness with which it can be lighted has been remarked by everyone who has examined it.

The carbide charges, called "carblots," are hermetically sealed and absolutely impervious to moisture, rendering them perfectly safe in any house or store, and therefore not affecting insurance. The carblots are of a very novel construction, whereby blotting paper is utilized in such a form that the water never comes in contact with the carbide, but the moisture which passes into the blotting paper is absorbed gradually by the carbide and gas is generated in an even and constant manner. Gas passes from the generating chamber, through a purifier, into the gas chamber, and is cooled, and the gas burns with a pure and white flame. In no way is it possible for gas to find an exit in any place except the burner, if the carbide receptacle is properly screwed up. The Bundy lamp can be relighted and burned two, three or four times with the same charge without renewing, if the stated number of hours have not been burned out previously. This is a valuable feature of the Bundy lamp. To produce a certain amount of light and a certain number of hours of actual burning in an acetylene gas lamp, it is required that the lamp should be of sufficient size to hold water and carbide enough to produce such volume of light for this number of hours. The beauty of finish and the graceful proportions of this lamp meet with general recommendation and approval.

The Bundy people are the sole owners of any and all patent rights for the use of an absorbent in the treatment of carbide in the gas lamp. Their factory in Elmira, N. Y., is large and completely equipped for the sole manufacture of gas lamps of all descriptions.

# REASON TO BE THANKFUL

Have you reason to be thankful?  
Is prosperity discernible in your business prospects for 1899?

## The Claus Bar

offers you every opportunity to be thankful—every opportunity to make prosperity come your way.

It is the only bar that will sell without an argument. The only bar the people want.

We are teaching people everywhere to ask for the Claus—to take no substitute.

We are telling them the plain, simple, truthful facts about our bar:—

That it is the only bar that can be adjusted without a wrench.  
The only bar that retains its width at all adjustments.  
The only bar in which all parts interlock.  
The only bar with an adjustment that will not wriggle.  
The only bar that can be adjusted while you ride.  
The only bar with a guarantee that never expires.

These are the points we are laying before the people. Points that will sell the Claus and the wheel equipped with it.

The dealer who has decided to carry the Claus in his sundry department and to specify it on his '99 wheels has reason to be thankful.

May we quote you prices?

# THE PASTIME AND SPORT

## Pacemakers Against Horses.

Philadelphia, Oct. 21.—While Major Taylor was practicing world's records at Woodside Park last Wednesday, two of his pacemakers, Nat Butler and W. F. Sager, were at Point Breeze track trying conclusions with the horses. Nat rode against Albatross, the guideless pacer, in a half-mile, best-two-in-three match. The horse won the opening heat handily. Butler, however, took the next two heats, and the race, not, however, without a protest from the owner of the horse, who al-

and the Union Velocipedique de France. The latter quickly accepted him as a member and conferred upon him the honor of "chief consul of the U. V. F. for America."

## Taylor Challenges McDuffee.

Last Wednesday Major Taylor, through his manager, Charles Ward, issued a challenge to Eddie McDuffee, former holder of the mile record, to meet him in a mile race against time, best two in three, either flying or standing start, as McDuf-

## Organizing Western Opposition.

St. Louis, Nov. 21.—C. W. Mears, official handicapper of Ohio; George D. Locke, newly elected chief consul of Illinois, and the local League workers were in conference here last Thursday laying plans for organizing western opposition to the eastern League ticket. With these three states as a nucleus, it is hoped that enough western divisions can be rallied to the support of the Pennsylvania faction to control the coming assembly and elect a western ticket headed by T. J.

leged that Nat rattled the horse by continually shouting "whoa! whoa!" throughout the second and third heats. Times of the heat were 1:08½, 1:08 and 1:16 respectively. Sager was not so successful in his one-mile venture against Lena N., whose driver kept the mare going 'till the cyclist was almost distanced, the race going to the horse in straight heats. The track was too rough for fast work on a bicycle. Times of the two heats were 2:20 and 2:20¼.

## Honors Conferred on Banker.

George Banker, the world's mile champion, who has been in France since last July, and who expects to remain in Europe until the end of next year, recently sent in his applications for membership in the Touring Club of France

fee may elect, the time in each instance to determine the winner, the contest to be decided on the same track on the same day and directly following one another, the toss of a coin to determine the precedence. Taylor states that not only will he personally wager \$1,000 on the side that he will win, but that his pacemakers will make up a similar sum between them to bet with McDuffee's pacemakers the same way.

A women's six-day indoor race opened in Chicago last Monday, the contestants riding two hours nightly. The principal attraction is Lisette, the French rider, who has ridden more than twenty-nine miles in the hour, and with a liberal handicap defeated Jimmy Michael in Europe, two or three years ago.

Keenan, first vice-president of the League.

## Bourrillon and Champion Win.

At Agen, France, November 6, Bourrillon won the 2,000-meter final heat of a scratch race in 4:20, with Guignard second, Dangla third, and Soibud fourth. He also won a match race against a tandem team, himself riding singly and passing the multiplet only by a hard effort in the home stretch. Champion won a fifty-kilometer match race from Bertin in 1:01:00, finishing eleven laps ahead of his opponent. Champion was motor paced, while Bertin had two triplets and two quadruplets.

in France, including the fifty and 100-mile records, paced by motor tandems, fitted with wind shields, wants to come to the United States to meet Harry Elkes, and other long-distance riders. He is under the management of R. Pogon, who managed Lesna's trip here in '97. Huret thinks \$5,000 and expenses would be sufficient inducement to bring him here, but would no doubt come for much less. He believes he can surpass Cordang's record of 616 miles in twenty-four hours.

**TAYLOR'S RECORD BREAKING ENDS**

After Placing the Mile Figures at 1:31 4-5 Major Quits—Pleased with His Slate.

Philadelphia, Nov. 21.—The world's mile record was lowered another fifth of a second last Wednesday by Major Taylor, who gave a really marvelous exhibition of riding and astounded the hundreds of spectators and the posted officials by his unpaced runs to close large gaps left by his pace. He had to ride twenty-five yards unpaced to make the first pickup, and fully seventy-five yards unpaced to make the second pickup, yet he finished strong in 1:31 4-5. He was paced by the Crooks, Henshaw and Callahan quint teams.

In the dressing room, after the ride, he complained of severe pains in the thighs and across the hips, and said that he had never felt the effects of his exertions before in that way. They soon passed away, however, and he went for the three-quarters mark again.

The pickup was well made in this case by the Henshaw team, and the Major finished strong a fifth of a second inside of record in a fine burst of speed at the finish. His time was 1:08 2-5.

Rain came Thursday, and continued to the close of the week, putting an end to the record breaking. Taylor was not sorry, for he was about ready to quit anyway, the strain of his last mile trial having left its effects. Thursday night J. H. Sager gave a banquet to the Philadelphia press men, and displayed the diving gear whose speed qualities Taylor has so successfully demonstrated.

Saturday the pacing teams were paid off and the great record camp brought to an end. During its four weeks the expense to the Sager Gear Co. has of course been heavy, but really nothing as compared to the expense which other makers went to years ago to attain smaller results. There was no expense for months of preparation, and two weeks served to clean up the record slate in most excellent style, only the two-thirds-mile record being missed in the list from the quarter-mile to the two miles inclusive. With the temperature close to freezing point in most of the attempts, only two failures were made, and Taylor was never once shaken from his pace, and no matter how ragged the pickups might be, he closed again and again gaps which would have been impossible to other record breakers. Taylor says that with his chainless gear it was impossible to lose the pace as he found the action so positive no jerks of the pacing machines could drop him. He used a twenty-four pound wheel geared to 114. He also had a twenty-pound machine but found no use for it.

Taylor now holds the following records:

Distance—	Taylor's Time	Prev. Record.	Holder.
Quarter-mile	:22 2-5	:22 4-5	E. Taylore
Third-mile	:29 4-5	:30 3-5	E. Taylore
Half-mile	:45 1-5	:45 1-5	E. Taylore
One kilometer	:57 3-5	:58 4-5	E. Taylore
Three-quar. mile	1:08 2-5	1:10	J.S. Johnson
One mile	1:31 4-5	1:32 3-5	E. Taylore
Two miles	3:13 3-5	3:21 2-5	E. Taylore

On the straightaway of the Nashville, Tenn., mile track, in October '96, John S. Johnson placed the quarter, third and

half-mile figures at :20 2-5, :27 4-5 and :44 1-5 respectively, but these were never accepted by the L. A. W. racing board.

**BOUHOURS MAKES RECORDS**

Without Wind Shields the French Favorite Lowers Palmer's 100-Kilometer Time—Other Records.

Paris, Nov. 8.—Paced by three electric tandems, and without the aid of wind-shields, Bouhours yesterday broke Palmer's 100-kilometer world's record of 1:59:47 1-5 by 2:28 on the Paris track, but did not lower Huret's record of 1:54:24 2-5, made October 15 with the aid of wind-shields. This last record is not officially recognized, but probably will be regarded as a world's record classified as "wind-shield" record.

Bouhours broke also the 80 and 90-kilometer and the 50 and 60-mile records, and continued, after covering the 100 kilometers, for the two-hour record, which he lowered by 1,826 meters. His new records are as follows:

Kilom.	Bouhours Time.	Previous Record.	Holder.
80	1:32:57 1-5	1:33:33 1-5	Bouhours
90	1:44:33 4-5	1:47:03 1-5	Palmer
100	1:57:19 1-5	1:59:47 1-5	Palmer
Miles.	Bouhours Time.	Previous Record.	Holder.
50	1:33:29:03	1:34:45:04	Palmer
60	1:52:55:03	1:55:20:00	Palmer
Hours.	1	2	Holder.
1	52 kil. 16 m.	55 kil. 831 m.	Elkes
2	102 kil. 15 m.	100 kil. 189 m.	Palmer

**Chase Challenges Elkes.**

Arthur Chase, the English long distance crack, has issued a challenge to Harry Elkes, holder of the hour record, to meet him in an hour race with unlimited pace for the best purse that can be secured, and a side bet for \$500. He wants the race to come off as soon as possible, and if Elkes cannot accept, he offers to ride against Tom Linton.

**NEWS IN BRIEF.**

Smith Fowler's quest for racing men to invade the Bermudas and Cuba this winter is not likely to be successful, as the racing men have promise of eight large meets in New Orleans and others southwest, which will bring them into California, where a circuit of a score or more meets had been arranged for this fall. Racing in Bermuda is largely an uncertainty, while California proved a good field for the circuit chasers.

Major Taylor says he has an older brother living in Indianapolis who can beat him at any point in the racing game, but who is too indolent and enjoys pleasure too much to go into training. If Major can induce him to ride next season he wants to match him against Michael's brother or Gardiner's brother, or against any other racing man, he says.

Chief Consul Rotier, of the Wisconsin division L. A. W., has tendered his resignation to President Potter, to take effect December 1, when his term expires, and has recommended Frank P. Van Valkenburgh for appointment to the position. There will be no division election this fall, and the old officers hold over for another year.

It is said that Earl Kiser does not like the stage. He is constantly afraid that Bald will be taken sick, in which case he would have to speak the star's lines. Kiser says that he has quite enough to say now, although it is but one line and he has a hard time remembering that, owing to stage fright.

The first state sidepath convention was held in Rochester, N. Y., November 12, and discussed bills to be presented to the legislature fixing bicycle license fees at from 50 cents to \$1 and creating sidepath commissions to supervise the construction and care of the paths.

The Kansas division election of officers in the League has closed, with the following result: Chief consul, James B. Doncyson, Topeka; vice-consul, H. E. Best, Council Grove; secretary-treasurer, A. E. Hickerson, Topeka; representative, O. K. Leigh, Hutchinson.

Washington, Nov. 20.—At the annual election of the local division L. A. W., the following officers were elected: Chief consul, J. W. Somerville; vice-consul, J. D. Frazee;

secretary-treasurer, Charles E. Wood; for representatives to the annual meeting, J. S. Jones, A. Girouard and Wm. T. Robertson. Mr. Somerville, who succeeds Wm. T. Robertson as chief consul, is one of the most prominent and influential business men in this city.

Edward Kragness lowered the fifty-mile standard road record to 2:13:29 on November 13, on the San Francisco and San Leandro course. The figures will hardly be accepted by the Century Road Club, however, as they were made on Sunday.

Floyd McFarland has met with success on the Pacific slope in arranging a circuit for the A. R. C. U., which will start the season's work in '99. With Sunday racing promised them, Californians are working to aid him in every way.

The racing season in Paris having closed, Tom Linton, Bouhours and Champion will pay especial attention to record breaking. Bouhours says he intends to hold all records from one to 100 kilometers, including the hour record.

Michael expects to bring his younger brother to America when he returns, and will enter him in middle distance races.

## AND TRADE REVIEW

VOL. XXII—No 5.

CHICAGO, DECEMBER 1, 1898.

NEW SERIES No. 54.

### BOARD OF TRADE DIES HARD STOCKHOLDERS TO MEET AGAIN

**Two-Thirds of All the Stock is Required to Wind Up the Corporation.**

New York City, Nov. 28.—What little life is yet left in the National Cycle Board of Trade will in all likelihood be pelted out of it on December 20, at which time the stockholders will again meet to complete the work of dissolving the corporation. At the stockholders' meeting held in this city on November 17, it will be remembered, the opinion was expressed that the Board "should be forthwith dissolved." The directors, taking this as their cue, spent a brief hour in ratifying the action of the stockholders. When next the stockholders meet it will be moved that the Board "is herewith dissolved."

Then all will be over but the shouting.

#### Instructing the Pallbearers.

The call for the second meeting of the stockholders has already been issued. It was accompanied by the following whip, the issuance of which was made necessary in order to make sure of a two-thirds representation of all the stock:

As the National Board of Trade of Cycle Manufacturers exists as a corporation under the laws of the state of New York, its dissolution can only be effected by compliance with the statutes which are very explicit in regard to a two-thirds representation at the meeting of which the enclosed notice is a warning.

It is, of course, desirable that you should attend in person, but, in the event of your inability to attend, it is sincerely hoped that you will execute the enclosed power of attorney at as early a date as possible and notify the secretary to whom you have executed the power of attorney, so that we may be sure of having a full representation at the meeting.

Permit me to suggest that any one of the thirteen directors—provided that you are sure that the one selected will be present—will take pleasure in acting in that capacity for you; or, if you deem it advisable, it will be entirely satisfactory if you will execute it, leaving blank the name of attorney, which can be filled in upon the date of the meeting, so that one of those present may act for you and we may thereby be insured the vote of your stock.

It is absolutely necessary to have acknowledgment of power of attorney made before an officer who has power to acknowledge deeds—a notary public or licensed officer. Where there is a New York commissioner it is suggested that your acknowledgment be made before him.

George Hammann,  
Secretary.

No corporation was ever helped out of the world with more punctilious regard for ceremony. Such solicitation for the safe conduct of this dark enterprise is no mean indication of what might have happened had the Board elected to make full use of its opportunities while it was conscious of its power.

Although it has been freely asserted that out of the ashes of the Board there

would arise an association of bicycle makers, which would legislate upon such subjects as were of importance to them alone—such, for example, as the guarantee and options—yet there are no signs at present visible which justify the hope that an early realization of such a hope will take place. Analysis of the condition of mind and feeling of bicycle makers discloses the shocking fact that the requisites for an enduring association of such people are not in evidence. There is similarity of interests, but not equality of interests. The large houses are fatuous in the belief that they will crush or absorb their small competitors, while the latter with undiminished zeal set to work to grow great and flourishing. With these warring sentiments in mind, it is absurd to entertain the belief that an organization could be founded which would exert much greater power for good than is to the credit of the corporation which is now being hurried to its grave. Still it is not improbable that an association of bicycle makers may be formed, with no large aims, which in conjunction with other trade organizations will shape minor affairs which threaten injury to the trade at large.

#### Tube Makers in Trouble.

Tube manufacturers in England are disturbed. A formal demand for an increase of wages has been presented in two or three places in the midlands. It is reported on fairly good authority that one of the large concerns will have great difficulty in paying dividends on its shares. Pressure has been put upon many buyers to complete their contracts during the past few months by one of the largest makers. The wisdom of the step has been questioned. It is now rumored that the company has been required to pay up a heavy amount to a German factory for goods ordered but not accepted. The amount involved is said to be \$60,000. There is a large shipment of tubing in the New York custom house. It has been there two years. Lately the owners have tried to induce the authorities to pass it at a reduced rate on account of the drop in prices, but without avail.

### PATENT COMMISSION'S REPORT PUBLIC HEARINGS ARE ENDED

**Caveats May be Abolished - Patent and Trade Mark Fees May be Reduced.**

Washington, Nov. 25.—The commission to revise and amend the patent and trademark laws of the United States has concluded its public hearings, and is now at work formulating a report on the matters considered and discussed at its several sessions. Among the matters that will be elaborated upon is the subject of international registration of trademarks.

#### Caveats Afford no Protection.

The sentiment in favor of abolishing caveats is strong, but it is not thought that the commission will recommend such a change. The United States statutes provide that an inventor, who is working to reduce his invention to practice, may obtain a provisional protection by filing in the patent office a drawing and description of his alleged invention. The scope of the protection afforded by such filing has always been a matter of dispute. It is held by some to afford the inventor no protection whatever, because it only entitled him to notice of the subsequent filing of another caveat, or of an application for a patent upon a similar invention, and it is argued that the same purpose can be accomplished by the subsequent filing of an application and giving opportunity to both persons claiming to be the original inventor to establish priority of invention. The statute does not extend the privilege of filing caveats to citizens of other countries which are members of the international union. The question whether this right should be extended to foreigners will be touched upon by the commission in its report.

#### Regarding Interference Proceedings.

Among the questions that will be discussed in the report is one in reference to interference proceedings. Under the prevailing rules a foreign inventor, who is contesting for priority of invention, is only permitted to carry back the date of his invention to the time of publication of his patent in a foreign country, while to the United States inventor is extended the privilege of establishing the date of reduction of the invention to practice, which is always earlier than the date of filing or issuance of the patent.

#### Trade Mark Fees are too High.

Another important matter that will be touched upon in the report is a proposition involving the reduction of the fees required upon the filing of an application for registration of a trademark in the United States. The present fee is \$25, payable at the time the application is made, and in case the registration sought

is refused because of conflict with prior existing registered marks, the applicant loses his fee. As the labor connected with the examination and registration of trademarks is slight, it is contended that the fee should be reduced.

#### Patent Fees May be Reduced.

Many arguments have been presented to the commission relative to a reduction in the fees demanded for the granting of a patent. The present fees amount to \$35, made up of a first government fee of \$15, and a final government fee of \$20. It is contended by inventors and patent attorneys that the first and final government fees should be placed at \$10 each, and the income of the patent office would still be sufficient to meet all its expenses. The officials of the patent office, however, do not look with favor upon any proposition looking to a reduction of the present fees. They argue that the fees now charged in the United States are less than those of any other country.

#### Separate Patent Court Needed.

The Patent Law Association of this city has made a compilation of the bills pending in congress affecting the patent laws, together with the views of the association thereon, and found that everywhere there was an agreement upon these three points:

1. The necessity of carefully studying out some plan to put into the best shape the mass of material piled up in the United States patent office, so that a thorough search might be made by the examining corps, by attorneys making validity searches, and by the public generally in search of information.

2. That there are now too many appeals in contested cases in the patent office.

3. That the present arrangement of circuit courts of appeals as courts of final resort is a failure in the patent system, and that one final court is wanted whose rulings will cover territory co-extensive with the grant.

For some time the association has been peculiarly impressed by the necessity of making a firm stand against the constant tinkering with the patent system by means of ill-considered bills. At this time it is the judgment of nearly all patent lawyers that some provision must be made to establish a final court in patent causes. Some desire a separate patent court—the majority, in fact, seem to favor that—while others would restore jurisdiction to the Supreme Court of the United States on the ground that there should not be a final court other than the Supreme Court for a special branch of law.

#### Installment Payments Bother Agents.

Buffalo, Nov. 28.—This is the hardest period of the year for dealers who sell on the installment plan. After the riding season closes buyers who bought on this plan, and still owe balances, forget the obligations, and as a consequence agents have great difficulty in making collections. In this connection the records of the police court recently furnished a curious instance of the needy condition of many buyers. A man was robbed of his week's salary while he slept in his apartments. The police accused the man's wife and she confessed, explaining that she was being pressed for payment of her bicycle and took this means of getting the money.

#### Space at the 1900 Paris Show.

The space allotted during the great Paris exhibition of 1900 to the French exhibitors in the cycle section has been increased to a much larger area than was obtainable at the lately-pulled-down Palais de l'Industrie, where the annual national cycle show was formerly held. The price of space will be \$4 per yard, with participation in the profits, if any, by the exhibitors.

## NEW BANKRUPTCY ACT RULES

### APPROVED BY SUPREME COURT

#### All Proceedings Heretofore Taken in Conformity to Act of 1867 Will be Upheld.

The United States Supreme Court has announced the new bankruptcy rules which it was authorized to frame and promulgate under the national bankruptcy act of July 1, 1898. They will take effect on January 2, 1899, and all proceedings heretofore taken substantially in conformity with the act and to the regulations of 1867 as far as practicable will be upheld.

#### Proceedings Delayed for Rules.

Notwithstanding the new bankruptcy law has been in force over three months the courts in eight districts declined to proceed with the reference and adjudication of the petitions for the reason that the Supreme Court had not promulgated the rules, forms and orders required by the act. In all other cases the courts have proceeded and adjudicated petitioners bankrupt or have referred the cases to the referees for action. Since the law took effect 1,700 petitions in voluntary bankruptcy have been filed. Singularly, the districts of Delaware, eastern Pennsylvania, Southern Georgia, Nevada, New Mexico, western Virginia and Wyoming show that no persons therein have applied to be adjudged bankrupt. As the involuntary feature of the law which permits creditors to have their debtor adjudicated a bankrupt did not take effect until November 1, it has been impossible to obtain any data with reference to the operation of this provision.

#### Summary of Principal Rules.

Rule 13 allows either the judge or the referee to pass upon a trustee appointed by creditors, but allows his removal by the judge only.

Rule 14 forbids the appointment of trustees by the courts.

Rule 15 renders it allowable to dispense with trustees in cases where there are no assets.

Rule 16 provides for the immediate notification to the referee of his acceptance.

The duties of trustees are outlined by rule 17. One of these requires him to prepare a complete inventory of all the bankrupt's property coming into his possession.

The regulations for the sale of property made by rule 18 provide that all sales shall be made by public auction unless otherwise ordered by the court.

Upon petition by a bankrupt, creditor, receiver, or trustee, setting forth that a part or the whole of an estate is perishable and that there will be loss if the same is not sold immediately the court may order the same to be sold, with or without notice to the creditors, and the proceeds to be deposited in court.

#### As to Proof of Debts.

Rule 21 relates to the proof of debts. The first provision under this heading is as follows: "Depositions to prove claims against a bankrupt's estate shall be correctly entitled in the court and in the cause. When made to prove a debt due to a partnership it must appear on oath that the deponent is a member of the partnership; when made by an agent, the reason the deposition is not made by the claimant in person must be stated; and when made to prove a debt due to a corporation, the deposition shall be made by the treasurer or, if the corporation has no treasurer, by the officer whose duties most nearly correspond to those of a treasurer. Depositions to prove debts existing in open account shall state when the debt became or will become due; and if it consists of items maturing at different dates, the average due date shall be stated, in default of which it shall not be necessary to compute interest upon it. All such depositions shall contain an averment that no note has been received for such account or any judgment rendered thereon. Proofs of debt received by any trustee shall be delivered to the referee to whom the cause is referred."

Rule 22 relates to the taking of testimony and is as follows: "The examination of witnesses before the referee may be conducted by the party in person or by his counsel or attorney, and the witnesses shall be subject to examination and cross-examination. A deposition taken upon an examination before a referee shall be taken down in writing by him, or under his di-

rection, in the form of narrative, unless he determines that the examination shall be by question and answer. When completed it shall be read to the witness and signed by him in the presence of the referee. The referee shall note upon the deposition any question objected to, with his decision thereon; and the court shall have power to deal with the costs of incompetent, immaterial, or irrelevant depositions, or parts of them, as may be just."

Under the head of "Conduct of Proceedings," rule 4, it is provided that "proceedings may be conducted by the bankrupt in person in his own behalf, or by a petitioning or opposing creditor, but a creditor will only be allowed to manage before the court his individual interest. Every party may appear and conduct the proceedings by attorney, who shall be an attorney or counselor authorized to practice in the Circuit or District Court. Notices and orders not required to be served on the party personally may be served upon his attorney."

Rule 6, relating to petitions in different districts, says: "In case two or more petitions shall be filed against the same individual in different districts, the first hearing shall be had in the district in which the debtor has his domicile, and the petition may be amended by inserting an allegation of an act of bankruptcy committed at an earlier date than that first alleged, if such earlier act is charged in either of the other petitions; and in case of two or more petitions against the same partnership in different courts, each having jurisdiction over the case, the petition first filed shall be first heard, and may be amended by the insertion of an allegation of an earlier act of bankruptcy than that first, if such earlier act is charged in either of the other petitions; and, in either case, the proceedings upon the other petitions may be staid until adjudication is made upon the petition first heard; and the court which makes the first adjudication of bankruptcy shall retain jurisdiction over all proceedings therein until closed."

#### In Matters of Priority.

In the matter of priority and in cases where two or more petitions are filed by creditors against a common debtor alleging separate acts of bankruptcy on different days, it is provided by rule 7 that preference shall be given to the petition alleging the earliest act of bankruptcy. In case all the petitions name the same day for the act the cases are to be consolidated.

Rule 8 provides that any member of a partnership who refuses to join in a petition to have the partnership declared bankrupt shall be entitled to resist the prayer of the petition in the same manner as if the petition had been filed by a creditor of the partnership and to make all defenses which any debtor proceeded against is entitled to take by the provisions of the act.

Rule 9 provides that in all cases of involuntary bankruptcy in which the bankrupt is absent or cannot be found it is made the duty of the petitioning creditor to file, within five days a schedule giving the names and places of residence of all the creditors of the bankrupt according to his best information. If the debtor is found the petitioner may apply for an attachment against the debtor to furnish a schedule.

#### Question of Redemption.

Rule 28 permits the filing of petitions for redemption of property whenever "it may be deemed for the benefit of the estate of a bankrupt to redeem and discharge any mortgage, or other pledge or deposit or lien upon any property, real or personal, or to relieve said property from any conditional contract, and to tender performance of the conditions thereof, or to compound and settle any debts or other claims due or belonging to the estate of the bankrupt." Hearings in such cases are provided for, notice to be sent to all persons interested, in order that they may appear and show cause why such order should not be issued.

Rule 29 relates to keeping of accounts concerning money deposited, and rule 30 to the imprisonment of debtors. The latter rule is as follows: "If, at the time of preferring his petition, the debtor shall be imprisoned, the court upon application may order him to be produced upon habeas corpus by the jailer or any officer in whose custody he may be before the referee, for the purpose of testifying in any matter relating to his bankruptcy. The court may upon like application discharge him from such imprisonment. If the petitioner during the pendency of the proceedings in bankruptcy be arrested or imprisoned upon process in any civil action, the District Court upon his application may issue a writ of habeas corpus to bring him before the court to ascertain whether such process has been issued for the collection of any claim provable in bankruptcy, and if so provable he shall be discharged; if not, he shall be remanded to the custody in which he may lawfully be."

Voluntary gifts when the donor is actually insolvent, and when the necessary consequence of his acts is to hinder or defraud his creditors are conclusively fraudulent.

**NINE MONTHS' CYCLE EXPORTS**

**SLIGHT DECREASE IS VISIBLE**

**Tables Showing Official Returns for September and Nine Months of the Present Year.**

Exports of bicycles and bicycle material from the port of New York for the week ending November 22, are recorded as follows:

	Bicycles.	Mat'l.
Austria Hungary .....	.....	\$ 224
Switzerland .....	.....	1,500
Holland .....	2,137	3,715
France .....	1,173	1,823
England .....	4,726	4,639

Totals .....	\$9,304,860	\$7,155,645	\$3,436,535

**Worcester Co. Mortgage Suit Decided.**

The foreclosure suit of the Central Trust company of New York against the Worcester Cycle Mfg. company, of Middletown, Conn., under a mortgage of \$500,000, which has been pending for several months, was heard in the United States circuit court at New Haven last Thursday. In the decision handed down the judge declared that the mortgage indebtedness was not sufficiently proved and that the mortgage held by the trust company against the bicycle company's Middletown plant was invalid. The arguments on both sides were based on technicalities. The report of the receiver, Frank S. Smith, on the condition of the property and as to the rights of the trustee, Charles G. Goodrich, was presented the same day.

**Seeking Location in Peoria.**

W. D. Smith, of the W. D. Smith Cycle Company of Denver, which during the past fall manufactured and sold a number of chainless bicycles driven by levers, has been in Peoria, Ill., recently with J. E. Miller, of Peoria, who is superintendent of the Denver factory, exhibiting his machine and endeavoring to interest Peoria capitalists in its manufacture. The intention is to move the Denver factory to Peoria and effect some sort of a consolidation with the Rouse-Hazard plant, manufacturing both the chain-driven and lever machines. Whether this can be done or not depends much upon the disposition that is made of the latter plant by the banks, which bought it in at sheriff's sale October 24. If such a plan is carried out it will require that about \$50,000 capital stock be taken by Peoria capitalists, of which amount one leading citizen has declared himself willing to take half. The promoters hope to close the deal soon and start a factory with from 300 to 400 employees.

The bicycle dealers of the City of Mexico are reported to be preparing to make a joint purchase of the Piedad bicycle track, for the purpose of promoting annual and quarterly race meets.

**REBATE ON AFRICAN IMPORTS**

**EXPORT TRADE ENCOURAGED**

**Shippers Sending Goods Through Cape Colony Will Get Rebate of Three Per Cent.**

The government of the colony of the Cape of Good Hope has reduced the rebate on imported goods passing through the colony to the inland states from 5 per cent to 3 per cent. This reduction applies to the South African Republic, Orange Free State, and Rhodesia, and marks an important departure. The colony transit rate has by this act been brought down to the level of the Delagoa and Beira rates, in Portuguese territory, and when Natal has followed suit, which will be soon, it will insure uniformity of the transit rate throughout South Africa. The reduction, it is stated, means a present of between \$250,000 to \$300,000 per annum to the importers of Johannesburg alone.

**America Benefits by Freight Rates.**

The increase that is taking place in the volume of American exports to Africa is causing no little concern abroad. At the same time it is causing no little satisfaction among shippers here, especially as the intense rivalry among the three regular African steamship lines—and the consequent low rates for freight—promises to continue. It is estimated that freight rates from the United States average about 15 per cent lower to South African ports than from London, the British lines working under a pool arrangement by which rates are maintained. Consequently where market conditions are about equal America is getting the preference. Furthermore, as cheap freight rates are now open to all, shipping to Africa is now much more general than formerly and is not confined to the few commission houses that formerly had absolute control of the African business.

**Growth of African Trade.**

The interest of the cycle industry in African markets is best shown by reference to the statistics which are available for eight months' trading during the present year, which amounted in value to \$117,447, as compared with \$91,282 for the same period in 1897 and \$16,893 for 1896. During the month of August last the value of the cycle exports to African markets amounted to \$16,015, as compared with \$14,056 for August of 1897 and \$8,665 for the same month in 1896.

Exports of general American merchandise to Africa are increasing with astonishing rapidity, and would of late have been much greater were it not that our trade with Madagascar has virtually ceased since the French took possession.

**Parts Making Plant to be Sold.**

Buffalo, Nov. 28.—The Supreme Court handed down a decision last week with reference to the disposition of the Spaulding Machine Screw Co.'s plant, which is in the hands of a receiver, and the referee will sell the entire plant under the foreclosure of a second mortgage for \$52,000 held by John R. Keim, of New York City, for money advanced to conduct the business. The sale is set down for December 8 and will be subject to a first mortgage indebtedness of about \$18,000.

**German Agents Under Suspicion.**

Exporters of bicycles in Europe are being publicly warned not to reply to applications for cycles from a German firm of bad repute, Josef Amrhein, of Wuerzburg, or Heinrich Schelbert, of the same town. Proceedings have been commenced against them for fraudulently issuing forged bills.

# Jobbing Bicycles

— ...FOR 1899 Trade

\*\*\*NO OLD STOCK. EVERY MODEL NEW.  
TALKING POINTS THAT HELP YOU SELL.

For the requirements of 1899 trade we shall build three  
distinct lines of complete bicycles, embodying all features  
of value known in up to date construction. ❀ ❀ ❀ ❀ ❀

## We Are Ready Now

to show you our samples and to figure on your supply,  
either in complete or stripped bicycles. SNELLI, Hubs,  
Handlebars, Forgings, Pedals, etc., are standard. Our  
long experience and immense facilities enable us to give  
you the best of service and guarantee you quality at  
the right prices. Your inquiries will receive our prompt  
attention. ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀

SNELL CYCLE FITTINGS COMPANY,  
TOLEDO, OHIO.

# THE CYCLE AGE

## AND TRADE REVIEW

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries, \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

Copyrighted, 1898. All rights reserved.

### ENORMOUS PROFITS ON SHOWS

Unless his carefully laid plans miscarry, Frank W. Sanger will clear up \$70,000 or more by conducting a cycle show in New York city next January. One would never guess at this by reading the following para-

graph from his circular to the trade:

Realizing that the cost of space to the exhibitor should be reduced to as low a price as possible, the management have made such cost at prices ranging from \$25 to \$125 the dimensions remaining the same. This charge includes platforms and iron uprights for signs, and is a reduction of one-half from the charges made in the last show.

Here are some calculations made from the chart of the show, which indicate the extent of Sanger's generosity:

69 spaces at \$125 each.....	\$ 8,625
102 spaces at 100 each.....	10,200
9 spaces at 75 each.....	675
41 spaces at 50 each.....	2,050
25 spaces at 25 each.....	625
Total of Rentals	\$32,175

Now there were about 100,000 tickets sold at the last cycle show held in Madison Square Garden, and they were worth 50 cents apiece. Granting that the forthcoming exhibition will be as successful in point of attendance as the previous one—to deny the probability of this would be fatal to the project—Sanger will be enriched by \$50,000 more. To this add a modest \$5,000 for pickings, such as installing electric lights, bar privileges, leasing furniture to exhibitors, and so forth.

Deduct \$2,200 for railings and \$2,430 for platforms—they are to be free to exhibitors—valuations which are obtained by referring to the contract prices on these articles at the time of the Coliseum show held in Chicago. Also deduct \$10,000 for advertising expenses, music, electric light, heat, rent—not \$1,000 a night, though, for Sanger is leasing the building this time, not renting it, and its price is undoubtedly made moderate, as it often is, to suit a special need—and then strike a balance:

RECEIPTS	
Rentals.....	\$32,175
Gate Receipts.....	50,000
Pickings.....	5,000
	\$87,175
EXPENDITURES	
Railings.....	\$ 2,430
Platform.....	2,200
Rent, etc.....	10,000
	\$14,630
Profit	\$72,545

With the prospect of a large profit, even before the doors of the exhibition are open, it is little wonder that Sanger can, with composure, say to the trade:

Nothing whatever will be spared to make the forthcoming exhibition as signal and distinguished a success as those heretofore given.

The whole subject is referred to the trade with power to object.

### FRAMES OF DOUBLE DESIGN

Think what he may about the merit and saleability of bicycles with thirty-inch wheels, no manufacturer probably feels absolutely certain of the quantity of this class of machines that he can sell. It is not precluded that the demand for them, after having been nursed up to a certain point, may suffer a sudden decline. The first set-back

has already come in the form of record breaking performances on chainless machines of two different types, and it is, at best, doubtful if troubles of other kinds will not arise after the riding season shall have opened. Manufacturers, in that case, would not like to find themselves caught with a large number of frames on hand, for which they could find no sale. Neither can they consider it desirable to delay manufacture until definite orders shall have been received. To do so is almost out of question under the present trade conditions, when prompt deliveries constitute an indispensable feature of success.

A frame construction which would be applicable to twenty-eight-inch wheels as well as to the larger size would, under these circumstances, seem to be desirable for safe trading. Extreme drop of the hanger and extreme shortness of the head are the uncompromising features of the thirty-inch wheel frames which allow no latitude in this respect, and which it seems that the prudent manufacturer should avoid incorporating in his production. If he could limit the drop to two and quarter inches, and raise the top bar one inch at the front end, his risk would be much reduced, and he would be enabled to proceed with manufacture at an even, economical pace and without too great anxiety about the possible fluctuations in the public's demands. By specifying "stirrup" pedals, "swinging" pedals, or "jointed cranks" for his thirty-inch model, the necessity for excessive drop might be obviated, and lengthening of the head to give the top bar a one-inch tilt adds at all events a desirable element of strength and durability, which will be more appreciated by the public next year than it is now.

A frame of this design, when used with twenty-eight-inch wheels, would, of course, show a horizontal top bar and a two and three-quarter-inch drop of the hanger. The rear forks would appear somewhat longer than necessary, but even this might be avoided by giving a greater range to the chain adjustment device. A hub construction providing for "removable" axles would make it easily possible to increase the range of chain adjustment to three inches by permitting the closing of the axle slots at both ends.

By the customary arrangements with chain makers for return of odds and ends of chains, loss on chain stock is readily minimized, and pedals, front forks and wheels would represent the only material, in regard to the purchase or making of which special caution would have to be observed.

Ordinarily it is doubtless a poor policy to straddle an issue and to build convertible machines of any kind, but in the case of the thirty-inch wheel fad the risks are many and the inducements are few, and a little safeguarding of the manufacturing interests would seem to be appropriate, for it may be assumed that dealers will not and cannot share any of the manufacturer's risks, but will give their orders in a highly conservative manner.

### ALLAYING BUYERS' PREJUDICE

The reduction in the list prices of chainless bicycles by so generous a margin as \$50 will add an element of minor difficulty to the relations between retailers and captious customers. To a very large class of people a lowering of price lists has every appearance of forced acknowledgment of former prices having been inflated to the point of unreasonably high profits, and they look upon a voluntary reduction, no matter how great, as still leaving the former conditions existing, only a smaller scale. Experience has shown that when the attitude of such persons toward any product is of this unreasoned nature, it is not changed by the reduction, but is only transferred along with and pitched against the lowered price list. The plain fact of greatly lessened cost to the buyer fails of appreciation, being placed in the shadow of the cherished and nurtured grudge against lists that have been withdrawn. In such cases, when a purchase has been fully decided upon, the funds and the contentions of the customer are arrayed against the article and its salesman as mercilessly as if the place of dealing were an auction house instead of a regular store conducted on recognized business principles; and, if vacillating is allowed, the price finally paid is apt to be determined by the force and effect of the counter resistance.

With customers whose common practice it is to browbeat the seller into making concessions, explanation and argument are

usually alike unprofitable; but there are instances where reference may be made to cycle trade conditions in a way and manner to satisfy reasonable inquiries, to gain friends and help sales. The first requisite to entrance upon such grounds is, of course, a thorough knowledge of one's subject. The next may well be that quality of open fairness of mind, allied with personal earnestness, which, founded upon the first requisite of knowledge, insures respect, even if it does not carry conviction.

The reasonable inquiry as to the \$50 reduction in chainless list prices for 1899 is not so difficult to answer in a logical and satisfying sort of way as may appear on the surface. The following outline might supply the framework for such an answer: High prices are the natural and normal accompaniment of a new device, or the introduction of some striking novelty in connection with an older one. In no other way could the expense of its production on a limited scale be safely met. The whole history of mechanical improvement bears corroborative evidence on this point. The conditions which go to make lower prices come into being only with the progress of a new device toward popularity and permanence, the former assuring ample support for its production on a generous scale, and the latter eliminating the factor of costly change. At the beginning, also, high prices are of positive value to buyers, taken as a whole. They act as a brake upon the tendency to adopt a new invention to the extent of departing from well-tried principles and making an unmanageable fad of the newer one. During this interval the experiments and conclusions of the laboratory and the factory are supplemented by those of the public, arrived at by independent means, on a scale, though limited, sufficient to add the testimony of experience from impartial outside sources. At first the expense of bringing out and sustaining the device rests upon the makers and a few who are willing to pay well for the privilege; but later it is shifted entirely upon the vastly increased numbers of buyers in such a way as to become a profit instead of a burden to the producers of it. In the last analysis, the interests of manufacturers, retailers and purchasers lie along one and the same line. The price of \$125, having served its original purpose in keeping the chainless situation within due bounds, for the first season, gives way, in the natural order of things, to the new price of \$75—a price whose fairness must appeal to every reasonably-minded person. In the present state of the cycle builders' art, however, that price is ample to assure the incorporation of the highest grade into all parts of the chainless mechanism, and at the same time adds very materially to the stability and solidarity of the industry. In point of time, and in degree, the reduction of \$50 in chainless prices for 1899 over 1898 seems most appropriate and justifiable.

These suggestions are given to retailers for what they are worth in practical application to individual cases. Their offering in detail insinuates no lack of knowledge of all mentioned points on the part of tradesmen. Their suggestive value may be considerable, however, first, as showing the desirability of meeting customers fair and square on all points of reasonable difference of opinion; secondly, as showing a manner of discussion which has met with notable success in several instances under direct observation.

\* \* \* \* \*

In many states in the Union there are statutes which impose severe penalties upon non-resident corporations which fail to comply with the requirements for doing business within those states. For example, until recently a foreign corporation which could not produce a certificate entitling it to conduct business in New York was unable to maintain an action in the state upon any contract made by it in the state. This law, which in effect was a franchise tax on non-resident corporations, was quite recently declared unconstitutional. Somewhat similar laws are in force in Illinois, Ohio, Indiana, Missouri, Michigan, California, New Jersey and Wisconsin. In all of these states the constitutionality of the laws is openly challenged and steps are being taken by powerful trade organizations to have them declared void. There has been no general compliance with the provisions of these laws, and the few corporations which have paid heed to them have done so under protest and with the understanding that they might later attack their legality. The primary intent of the laws was to make the secretary of each

state the agent of non-resident corporations so that service could be had without going outside of the state to obtain it. The laws discriminate so strongly against non-residents that it is the unanimous opinion among competent lawyers that no outside judge would decide that service could be had on a secretary of state, and consequently any judgment rendered could be set aside. Such laws interfere with interstate commerce because they restrict trade between the various states. They are clearly in violation of the federal constitution, which guarantees that the citizens of one state shall enjoy all the privileges that are granted to the citizens of any other state. It is even believed that it can be shown that such laws partake of the nature of class legislation in exacting from non-residents of a state what is not exacted from people who reside in it. The advice of a state attorney-general, conspicuous for his legal learning, to all who may be harassed by the operations of such laws is to slight their importance and swing into line with the organizations which, as fast as is practicable, are training their batteries to destroy the last vestige of illiberal enactments. The corporate interests in the cycle industry, which, through the instrumentality of the national board of trade were worked up to a high pitch of excitement in the early portion of the year, may, therefore, take heart of grace and quiet their unreasonable but unnatural fears.

\* \* \* \* \*

Tire fastening on pacing machines was lately made the subject of considerable theorizing on the part of racing men, when the postponement of one of Taylor's racing matches was made necessary by the creeping of a tire. With characteristic love of the most mysterious and theatrical explanation that could be squeezed into service, the creeping was ascribed to the "enormous heat developed by the ground friction of the tire under the magnificent speed of these space-annihilating machines." This heat is supposed to have melted the rim cement, although air and rubber are both notoriously bad conductors. A less far-fetched explanation may probably be found in adulteration of the cement, the weight of the machine with its riders and the large diameter of the tire; factors acting as simple mechanical elements for overcoming the adhesion between tire and rim. If cement will sometimes give way on ordinary bicycles under the stress produced by the small resistance to their propulsion operating of a leverage of 1½ to 1⅝ inches—the diameter of the tire—it is hardly to be wondered at that the resistance to the propulsion of a multiple machine, being greater nearly in proportion to the number of riders, will cause the same result with frequency when operating with 2 to 2½-inch leverage. The increase of tire diameter, it is true, is somewhat offset by the larger cemented surface of the broader rims, but the stresses due to the weight cannot be circumvented. On motor vehicles it has been found necessary to resort to mechanical fastening of the pneumatic tire casing. Probably a similar expedient should be adopted for large pacemaking machines.

## NO USE FOR CYCLE SHOWS

### An Emphatic Condemnation of National Exhibitions by Makers of All Kinds

Makers are being asked to exhibit at two national cycle shows, one in New York and the other in Chicago, but for reasons which are obvious to all who have tasted the bitter fruit of past national exhibitions they prefer to hold back their support. If one only gave heed to the noisy demonstrations of the show promoters he would be inclined to conclude that the entire body of manufacturers was aflame with eagerness to participate in the exhibitions, but careful enquiry reveals the fact that many of the concerns which were conspicuously identified with the outward success of shows in other years are resolutely determined to get along without the use of such adventitious aids to business.

The show promoters are straining every nerve to have it appear that they are but acting in response to a spontaneous trade demand. In New York the suave Sanger, affecting no deep knowledge of trade conditions, rests his argument upon the apparent need there is for enlightening the "thousands of new riders who have never attended a cycle exhibition, nor had the opportunity to examine the latest improvements under the favorable conditions afforded by a national show." If he did not perceive this darkened condition of mind in the public Sanger would be wanting in one of the chief qualifications for a man of his calling. A little matter he cautiously refrains from mentioning, however, is thoughtfully summoned into view by one of his critics, who wittily remarks that though millions go to see the elephant at the circus and cheerfully plank down half a dollar for the privilege, yet none is desirous of buying the elephant.

#### The Trade is Off Its Base.

The adventurous Van Sicklen in Chicago is not content with so plain a presentation of the necessity for his show. He is ambitious of doing something more than merely staging the wares of exhibitors. He, therefore, appears in the role of trade prophet and vows to make the fortunes of all who will pay tribute to his genius. With a national show he will cure all the ills which are tormenting and devitalizing the cycle trade. He will, to quote his own brilliant diction, "put the trade back on the pedestal on which it stood in former years." His fiery, tumultuous thoughts on the subject of the relation of the trade to shows escape expression in human speech and he brays in this fashion:

There is no industry so great that it can afford to drift along, taking things just as they come, and make no effort to better conditions now prevailing in the cycle trade.

Other fragments from Van Sicklen's elegant plea for trade support are herewith presented:

The action of the "powers" in shutting off on cycle shows has resulted in a loss of interest by the general public, and a consequent loss of sales. A properly conducted show will, in a large measure, rectify this trouble and have a tendency to put the trade back on the pedestal on which it stood in former years.

The cycle industry is the only great industry not represented by annual shows. The impression two or three years back was that cycle shows were simply jollification meetings, and were not responsible for the great interest being shown in the industry by the general public. The apathy of this same public since the discontinuance of these shows should prove conclusively that they are a good thing.

This show is to be given with the idea always in view to boom the trade, arouse enthusiasm that is and has been dormant for

months, and should receive your hearty co-operation.

Expenses will be kept to the very minimum, consistent with the proper conduct of the business, and no exorbitant charges will be made.

#### What the Makers Say.

Now what do makers say in reply to these and similar foolish statements? Just this:

1. That national exhibitions interfere with trade policies.
2. That they are too expensive.
3. That they keep alive the public's eagerness for novelty.
4. That they are much inferior to road work, with which they greatly interfere.
5. That they are of no service at all to parts and material houses unless held in August or September.
6. That they are market places where prices may be cut.
7. That they do not attract dealers whose orders are most difficult to secure.

Whatever may be thought of these opinions by professional showmen, or whatever the outcome of their efforts to make their enterprises stick, it is absolutely certain that the exhibitions of the coming year will as little resemble those previously given as a mountain looks like a pin head. From the shows in Chicago and New York the firms which make machinery, material, parts and the like goods will be absent. Many who formerly exhibited bicycles, tires and rims will also test the virtue of holding aloof. In fine, it is extremely probable that both shows will prove disappointing in the number and character of cycle exhibits, which will scarcely be atoned for by the much-vaunted display of automobiles.

#### Condemnation of the Shows.

The following opinions may help to steady those houses which are wavering between a desire to cut loose from shows and a fear that they will have no support in so attempting:

#### Nothing Equivocal About This.

Most emphatically, and without the slightest hesitation, we say we are opposed to cycle shows at any time, place, or under any circumstances. We can think of nothing that would induce us to encourage exhibitions of this kind in any way, shape or manner. We do not think it is any more essential to hold cycle shows in order to enhance in any way the interests of bicycle manufacturers than it is necessary for boot and shoe makers, harness makers, furniture manufacturers or the manufacturers of any kind of goods to hold annual exhibits in order to convince their patrons that it is necessary for them to wear boots and shoes, to put harness on their horses, or furniture in their houses.

ECLIPSE BICYCLE CO.

#### Double Work for Traveling Men.

We do not believe in cycle shows, because in our judgment there is a very much more economical way of handling this kind of business. Latterly it was our experience that the buyer was simply a looker. He came to the cycle show to see what he could find in the market, then went home, and it was necessary for a traveling man to visit his establishment in order to sell him at all. The result was really a double expense, because the traveling man could show him and convince him just as readily by his samples as he could to show him his samples at the cycle show and then visit him afterwards.

HUNTER ARMS CO.

#### Shows Distract Agents.

We are not now and never have been in favor of bicycle shows. A few years ago, when they seemed to be considered a necessity by the majority of the trade, we refused to have anything to do with them, as our first and only experience in that direction taught us that a bicycle show was a

great detriment to our business. We prefer to go out after our customers rather than to have them come in all at one time, when they are so much taken up by other things that they return to their homes without having bought anything, at least in the way of a bicycle. Our opinion has always been that a bicycle show should not be a place where any wholesale business was invited or expected, but that if any such a function were held it should be with the idea of interesting the general public and not with the idea of making a trading place of it. In the event of such an exhibition the best time to hold it would be just before the opening of the riding season, say in February.

NATIONAL SEWING MACHINE CO.

#### Shows Delay Sales.

We are unalterably opposed to cycle shows. We think a show is the greatest detriment to the bicycle manufacturer that he can have. It only delays his sales, holds his business back, and keeps him in ignorance until after the season is on, then it all comes in a rush, and the result is there is no good derived. Regarding local shows, would state we do not believe in these. We think the only way to show bicycles is for each agent to have his own opening, and it is a good idea when they can all have their opening on the same day. We would not do anything to promote a cycle show of any kind, as we have had experience along this line with the previous shows, and it is only a good place to spend money and hold back your business.

THE HOFFMAN BICYCLE CO.

#### Shows Hurt the Makers' Interests.

We think that cycle shows, both national and local, are a nuisance to the business, tending only to hinder instead of advance the manufacturer's interests.

REED & CURTIS MACHINE SCREW CO.

#### No Use for Cycle Shows.

Cycle shows are directly for the benefit of cycle manufacturers. As we are not cycle manufacturers, we do not consider that we are in a position to express an opinion as to whether such shows are beneficial to the industry or not.

THE BILLINGS & SPENCER CO.

#### Expense Enormous; Benefits Doubtful.

The expense to the manufacturer of taking part in an exhibition is enormous, and the benefits derived are of a doubtful nature.

THE NEW YORK STANDARD WATCH CO.

#### Will Not Support Shows.

We are not in favor of cycle shows of any description; we will not support same.

MARIO CYCLE WORKS.

#### Will Not Exhibit at Shows.

We are totally opposed to bicycle shows, either general or local, and would decline to participate in them.

INDIANA BICYCLE CO.

#### Opposed to All Shows.

We are not in favor of cycle shows, and we are especially opposed to a national show.

JULIUS ANDRAE & SONS CO.

#### Shows Unsettle the Market.

We are not, and never have been, believers in national cycle shows. The state of uncertainty in which they keep the market is very detrimental to the interests of manufacturers, particularly those of our own kind who cater to the jobbing trade. We have attended a good many shows both in private capacity and as exhibitors, but could never see that enough business resulted from such exhibitions to warrant the expense and trouble. We think, however, that small local shows help to stimulate interests in a retail way.

COLTON CYCLE CO.

#### Promoters and Exhibitors in Danger.

We are opposed to all cycle shows, either local or national. We believe that they are no longer needful to the industry. From a commercial standpoint we cannot but foresee disappointment to both the manager and the exhibitor. If a cycle show is held at all it should be arranged for early January in New York, with a view to interest the smaller dealer, the rider and the foreign buyer.

LEAGUE CYCLE WORKS.

#### Parts Makers Oppose Shows.

As parts makers we are opposed to shows.

THE CLEVELAND MACHINE SCREW CO.

#### Shows Interrupt Business.

We are inclined to doubt the profit to manufacturers of a general bicycle show. It is possible that could such a show be held in the month of November it might result in sales of sufficient magnitude to warrant the expense incurred. We believe that a large bicycle show awakens considerable enthusiasm in the local public, but do not believe

that the enthusiasm thus awakened extends beyond the locality immediately adjacent to the exhibition. In our judgment a show held in the month of February is not profitable to the manufacturer, for the reason that it takes the time of a number of people who might at that season be much more profitably employed.

BUFFALO CYCLE MFG. CO.

#### Shows Inferior to Road Work.

We have never considered a bicycle show particularly advantageous to manufacturers. It is our experience that efficient road work is far superior to exhibitions. While shows no doubt attract a large crowd, the same may be said of other things. People will pay 50 cents to see the elephant at the circus, but no one wants to buy the elephant.

STRAIGHT MFG. CO.

#### Tire Makers Don't Want Shows.

Our experience has been that cycle shows are not necessary, and in case one were held we probably should not take space.

AN EASTERN TIRE HOUSE.

#### A Hint to Show Promoters.

We are opposed to shows because our experience has made it very plain that we can get the same amount of publicity for less money by means of the usual methods of advertising. It may be, however, that their real benefits are greater than their apparent ones. Undoubtedly in the past they have acted as a stimulant to the trade, and the trade (like an individual under the same circumstances) has suffered from the ill effects. This experience is not likely to be repeated, and if shows shall be proven to contribute in any measure to the popularity of the pastime, they will be worthy of the continued support of the trade. There is no reason why the exhibitor should be put to a dollar's worth of direct expense. Spaces should be free, and the cost of delivering the goods to be exhibited borne by the exhibition company. The gate receipts are large enough to warrant this, and yet pay the proprietors a very handsome profit. We would favor holding shows, if at all, at the beginning of the retail buying season, so that the benefit of the impression made upon the buying public may be derived immediately, and not lost or weakened through the lapse of several months, as would be the case if shows were held earlier.

THE AMERICAN DUNLOP TIRE CO.

#### No Faith in National Shows.

We do not believe in national cycle shows. We have exhibited at a number of them, and while it has brought us orders we would have obtained the same orders without the use of the show. While we are not advocates of local shows, yet we think in many instances they might be a benefit to local dealers. That is a matter, however, that must depend upon conditions existing in the local territories in which they are held, and the manner in which the dealers can agree on holding them.

THE SHELBY CYCLE MFG. CO.

#### Too Late for a National Show.

We have grave doubts as to the value of national cycle shows. It is now too late to hold one this season. Traveling men are unable to do any work on the road prior to, or during the progress of the show; hence, if held at all, they should be not later than the month of November, in the early part of the month preferably. As to local shows, we believe that an opening, well advertised, given by the local agents, is far less expensive and more profitable.

ARIEL CYCLE MFG. CO.

#### Shows do not Attract Dealers.

We do not approve of a national cycle show, as it would attract only a very small per cent of the local dealers, and they probably would be from the immediate vicinity, and possibly a few of the larger dealers. Local shows we believe do good when properly managed. The most appropriate time for holding them would be shortly before the season opens. We ourselves are not very enthusiastic over shows of any kind.

INDIANAPOLIS RUBBER CO.

#### Many Agents Cannot Attend Shows.

We do not consider a national cycle show a desirable feature for '99 business. Neither do we favor local cycle shows. We are of opinion that the national cycle shows are somewhat of a detriment to the trade, as it is almost impossible to close contracts with agents prior to such shows, and they refuse to look at samples shown them previously. Then in many cases they are unable to attend the show when the time comes, which necessitates covering the territory twice. In regard to local shows, our experience has been that the local trade will attend such shows, but there is very little business done during the show, and they are further a needless expense, giving very little returns. It is our opinion and experience that in the present condition of the bicycle business the

customer makes a very thorough canvass before making selections, regardless of a show.

INDIANAPOLIS MAKER.

#### Usefulness of Shows is Ended.

We consider the cycle shows have served their usefulness. The bicycle business is now getting down to bedrock, like any other legitimate branch of business, the novelty and false boom having worn off. A cycle show, wherever it is held, generally forces the season, and it also aids in keeping alive the "season business" in bicycles. By this we mean the custom of having entirely new models each year—as though any wheel were only good for just one year, and then must be materially improved upon. This idea of a '97 model being entirely out-of-date as soon as the '98 model comes on the market is, of course, untrue and unnatural.

THE BRIDGEPORT GUN IMPLEMENT CO.

#### National Shows not Wanted.

We do not hesitate to record our vote against cycle shows as a general thing. If, however, the majority of the trade favor exhibitions we sincerely hope they will be local affairs, held late in the season (February or March) and conducted by the dealers for the purpose of attracting the riders' attention to the new models.

PEORIA RUBBER & MFG. CO.

#### Parts Cannot be Sold at Shows.

We are opposed to a national cycle show. Such a show is too unwieldy, and the trade is too much scattered to take part in such an exhibit except at great expense. Furthermore a national show delays business, and upsets all calculations of manufacturers. It is true that a national show in the early winter will enable a manufacturer to sound the riders on the innovations which he proposes to make in his line, so that if they don't take he can abandon them before he sinks additional capital. But suppose the new features prove popular, his competitors who are not blind will still have time to get on the market with something similar, and all the expense of original investigation goes for naught. We believe that there should be local cycle shows. The proper time is Washington's birthday. Manufacturers' plans are complete at this date; their agencies established; their attention can be better given to shows and they will have a stock of goods in every important trade center, so that a special exhibit need not be sent out from the factory. An impression can be made on riders at this time, and bicycles and sundries can be sold, which should be one of the chief things to consider. It is believed by some that the parts makers would be benefited by an early national show. We doubt it. Bicycle parts are sold on merit, or because of price, and a cycle show is a very poor place to sell anything to your brother exhibitors. Furthermore, the men usually in charge of a cycle exhibit are the salesmen and not the buyers of the company that they represent. When we do have more cycle shows, let us have them managed by representative men in the trade.

THE THAMES CHAIN & STAMPING CO.

#### Weary of Shows.

We hardly believe we are in favor of any more shows.

INDIANA CHAIN CO.

#### Favors a Show for Parts Makers.

From our own standpoint we can see no advantage in holding cycle shows. Whatever business we have with the cycle trade is generally done in August, September and October, and the small trade we do not get until February and later. We would suggest that if there is to be a cycle show that it should be an exhibit for manufacturers of parts only and should be held not later than August of each year; but if there is to be a cycle show of completed bicycles to appeal to the public, it should not be held anyhow until after January.

S. D. CHILDS & CO.

#### Opportunity for Freak Exhibits.

Recalling the extraordinary success of the New York shows of two and three years ago, when the Madison Square Garden was filled to the roof with exhibits and enthusiastic visitors, one could hardly account for the changes which would warrant any uncertainty as to their value to the trade and maker; but recent shows have been very different, either through circumstance or natural causes, and the question may well be asked if they are of value. We fear that the cycle business is undergoing such rapid and radical change that it is hardly worth while to stop for anything like a cycle show, and when it has gotten through with its changes perhaps the novelty and interest will be so completely knocked out of it that it will be like having a buggy or clothing show; in other words, the freaks and freak manufacturers will be gone and the business will be reduced to the same hard pan basis that other manufacturing stands on, and makers will not only be unable to stand the expense, but will not have the in-

clination to indulge in such things. The novelty is disappearing in the wheel business and with it, we believe, the shows.

R. H. INGERSOLL & BRO.

#### Shows Cause Price Cutting.

It is decidedly to the disadvantage of the manufacturers to hold a national show, for the reason that it encourages cutting prices, which is sure to come by having a number of makers side by side selling their goods. We would not favor a show except for the retail dealers. We believe a show for the dealers should be held sometime in the early part of February.

FANNING CYCLE MFG. CO.

#### Smooth Sailing Without Shows.

We do not think it is good policy for cycle manufacturers to exhibit at cycle shows. The tendency of all agents to hold off buying before the cycle show is a source of a great deal of annoyance, inconvenience and expense to manufacturers. It is absolutely nonsensical to think of making them of a national character in any event, and we would not think of supporting anything but local shows if we support any. This year's experience satisfies us that if there are no shows to interfere that salesmen can go out earlier and get business, which makes smooth sailing.

THE OLIVE WHEEL COMPANY.

#### Good for the Sport.

We hardly know how we stand as regards shows. There are arguments for them and also good arguments against them. We are inclined to believe, however, that a good show held in Chicago, followed by another one in New York, would have a tendency to keep up the interest in the sport.

We are inclined to believe that some time in the month of February is as good a time as can be chosen.

THE KIRK MANUFACTURING CO.

#### Believers in Trade Shows.

We are decidedly in favor of cycle shows. We believe that these shows should be trade shows, limited to two in number and held in January, one in New York and the other in Chicago. It is our opinion that these shows would be of inestimable benefit, but to obtain the best results they should be held under the auspices of some representative trade organization, if possible.

CUSHMAN & DENISON.

#### Chicago as a Show Center.

We believe that a national show held in Chicago would be of benefit not only to the trade of Chicago, but to the whole country. We favor such a show and would probably exhibit in it.

THE WHEELER SADDLE CO.

#### No Show in Brooklyn.

At a meeting of the Associated Cycling Clubs of Long Island held November 21, in Brooklyn, it was voted not to hold a cycle show in that city. So the chances for a show in Brooklyn can be considered slim unless the dealers take hold of the matter and conduct a show themselves.

#### Profits of English Makers.

Recent company reports from English concerns reveal the following profits or losses:

	Loss.	Profit.
Abingdon Cycle Co.....	\$ 51,995	
Appleby (chains) . . . . .		6,955
Dunlop Fittings . . . . .	\$22,325	
Jointless Rim Co. . . . .		133,390
Centaur Cycle Co. . . . .		91,295
Premier Cycle Co. . . . .		248,760
Quadrant Cycle Co. . . . .		8,100
Raglan Cycle Co. . . . .		77,605
Rudge-Whitwork Cycle Co. . . . .		106,115
(a) Riley Cycle Co. . . . .		\$ 23,210
(b) Star Cycle Co. . . . .		36,620
(c) Rover Cycle Co. . . . .		63,945
(d) Seddon Tire Co. . . . .	\$44,215	
(e) Presto Gear Case Co. . . . .	5,785	
(a) A dividend of 5 per cent was declared on \$155,000 capital stock.		
(b) Holders of preferred stock were paid 7 per cent dividend and holders of common stock 5 per cent. The capital stock of the company is \$600,000. The sum of \$12,500 was placed to reserve.		
(c) The capital stock of this firm is \$750,000, on which a dividend of 5 per cent was declared. The reserve fund now stands at \$50,000.		
(d) This loss has been accumulating since May of 1896. The capital stock of this company is \$625,000.		
(e) This loss is attributed to litigation and heavy depreciation in value of stock.		

The first Bulgarian cycle works were recently opened by M. Weber in Rustchuk.

## THE ENGLISH SHOWS

### General Features of Stanley and National Shows Distilled from Announcements and Illustrations

If the two annual English cycle shows, the Stanley and the National, which were this year held in the same week, November 18 to 26, have served no purpose at all commensurate in importance with the expenditure which they have involved, they have at least furnished an occasion for comparison between the English and American developments of the industry. While reliable information in regard to the public's attendance and the success or failure of the exhibitions as marts of trade where agents and jobbers are invited to open and close negotiations, have not yet come to hand, the general features in regard to new construction and the popularity gained for mechanical details, which at the time of last year's shows were placed on the scales to be weighed and judged by the public, are readily recognizable now from the advance notices of the exhibitors, which, in accordance with a time-honored tradition, have been reproduced by the English cycle press, and it seems probable that little information of value to American exporters or of interest to the American trade will be forthcoming from later and more explicit reports, except insofar as illustrations of ingenious details may then be given.

#### Catering to Small Builders.

That the necessity for economy is being realized by the English manufacturers is plainly evidenced by the fact that a considerable number of firms, which in former years patronized both shows, have this year chosen one or the other. It is supposed that it was one of the objects of making the two exhibitions simultaneous to enable the manufacturers to practice this retrenchment with good grace. In several instances it is noticed that a manufacturer gets double or triple representation, however, through the exhibits of jobbers who market his goods and who also have stalls at one or both of the shows. All through the Stanley show there was a marked frequency of exhibits of machine tools and material intended for the small local builder, indicating at once that the tendency to local manufacture has gained strength by those errors in financial policy of the large manufacturers which are now being so frantically corrected, and that the local builders have not yet been provided with all the needed facilities for doing good or economical work.

#### Back Pedaling Brakes in Evidence.

The construction features by which the English industry on the whole is distinguished from ours may be summed up in a few words, if only the finished product and not the methods of production are considered. The prevalence of gear cases, guards and brakes need hardly be mentioned, except to note the domination of the spoon brake applied to the tire over back-pedaling brakes. Rim brakes, especially the Bowden brake and the American Stanley rim brake, are inseparably connected with the use of steel rims for the wheels, yet they are not especially favored by the exhibitors. Rather may it be said that American back-pedaling brakes are gaining in favor, while yet distanced, so far as numerical representation at the shows is concerned, by the hand brake with spoon attachment. A special feature is the

strong inclination for a "free pedal" evinced by representative concerns. It is usually employed in connection with brake arrangement and is in all respects analogous to the automatic coaster and brake devices, which also in this country are being extensively adopted everywhere, except in large cities. The Juhel pattern of this device, which is a French invention of several years' standing, is the one preferred by the Humber company and combines the "free pedal" with a band brake operating on the front sprocket wheel. The whole aspect of the brake and coaster question as presented at the shows seems to indicate that the English public is as yet floundering in uncertainty on this point and that the market is open to conquest by whomsoever has the most meritorious thing to offer, and the means for pushing it into notoriety.

#### Approved British High Grade.

After this digression into the brake situation, which is not specifically English, it remains to point out what really constitutes the hall-marks of British 1899 construction, and especially high grade construction. Medium and lower grade designs scale downward from this, being as ever before determined by purely financial conditions. The hall-marks referred to are  $\frac{1}{2}$  or  $\frac{5}{8}$ -inch pitch roller chains resulting in front sprockets with as many as 86 teeth; "twin-stays," that is, lower rear forks consisting of two reaches of round tubing on each side of the wheel, the tubes being placed one above the other at a distance of about one inch, center to center, and joined butt-ended in a fork end fitting. The tubes are not cranked but brazed to a forging or casting that allows room for the good-sized sprocket wheels, which the public demand for high gears, makes necessary. The last characteristic feature that has become sufficiently general to signify common approval, is the eccentric chain adjustment which is usually adopted in connection with the twin stays. Vertical rigidity of a very positive order is the evident purpose of the double forks, and it is therefore consistent when the figure eight section forks, which were first employed to this end and were seen frequently last year, have given way to the two separate tubes held apart, truss-like. Isolated instances of the figure eight form are seen, however, and a firm or two use the double tube construction in front forks also so as to go on record in contradistinction to the Triumph company and other constructors, who favor "spring frames" and use round tapered front forks in the firm belief that even a single tube if of oval cross section is too stiff for this portion of a bicycle. If any other features should be pointed out as representing British preferences, one would begin to trespass on the ground which separates thoroughly approved from tentative construction. Still it is noticed that new alloys of white, non-corrosive metal are shown in hubs and spokes and that the tendency to replace steel with such metals meets with steady support if the continued and serene offering of them at shows and in the open market is a safe indication. Their luxurious price seems in reality to be the only obstacle

for a more general adoption of them. So long as this price remains, it may be surmised that English riders of subdued ambition and purse capacity will continue to guard against corrosion by patronizing the paintshop and the pegamoid company, and shunning bright steel and thin nickeling. Brazeless frame joints were much more strongly accredited at these shows than they were last year; the indorsement of the press has been obtained for them in a liberal measure and they would perhaps develop into a British feature of importance if their use were not hedged about by patents which seem to cover the available methods pretty thoroughly. Under the existing conditions the probation-period for them will probably be extended for several years before any decided preference, or the reverse for this manner of joining tubes will be pronounced.

#### Construction Under Probation.

Two morsels of new construction are presented which hold about the same interrogative relation to the market this year as several of the above mentioned features did last year. These are the spring frame and the long crank. Spring frames in one sense of the word are of course an old thing in all markets; but that which is now bidding for recognition is the "scientific" spring frame; indeed, a spring frame without springs, based upon the apparently heretic assumption that rigidity is a much overrated quality—except in rear forks—and has less to do with strength and efficiency of power application than commonly supposed. Being prolific of sharp internal vibrations in the structure, rigidity, it is also contended, militates against durability of a bicycle, and, as for comfort, even at hill-climbing, it is argued without serious contradiction, that the rigid machine is not worthy of comparison. These theories are finding ardent advocates in the British isles and may have a formative influence on future construction and on the weight question. So far they are exemplified in curved tubing which serves well the purpose of advertising the idea. Later they may run to lengthened wheel-base and thinner tubing of heavier gauge, so that finally the bicycle may present its largest tubing in the rear forks; or the trussed rear forks already mentioned may become the prevailing fashion in combination with thin tubes in the frame. The Pedersen or "cantilever" machine is exhibited in modified patterns by a number of licensed manufacturers and is a phenomenon pointing in the same direction.

#### The Long Crank Movement.

Long cranks, nine inches, have won laurels among English riders and writers of some influence. They are championed by a few companies in a tentative fashion, but do not as yet seem to carry the general public with them. Necessitating a high hanger, they are unlikely to influence forms of manufacture until a province of usefulness has been unmistakably marked out for them. Their adoption was first argued with force by an Austrian engineer of some note and he was ably seconded by Crompton, an English engineer of mature years. The advocates for their use seem to have been principally found among the veterans of cycling, and thus the suspicion is given color that long cranks are especially adapted for those whose muscular system no longer responds to nervous impulses with the automatic celerity of youth. If this should be so the long crank movement may yet be credited with giving a valuable hint of greater value for the future than it could have been at any time in the past.

When it is mentioned that the facts so far known in regard to the two shows furnish strong indications of a very inter-

esting evolution in the tire market favoring the most easily detachable and the most resilient patterns and that the "tubeless" tires, Fleuss and Trench, have lost none of their chances for success in the past year, nearly everything has been noted which may be dignified as "trade movements" of importance for present or future business plans. The Quadrant roller gear bicycle is the strongest British element of defection from the chain driven type. Not being made under the license system its progress in the public estimation is retarded, however, and it seems difficult to foresee to what extent it will pave the way for other, possibly American, types of chainless construction. The French Acatene and the Columbia chainless seem both to be farther advanced in the ways of commerce. The Elliptic is a chainless construction of the kind in which reciprocating levers are employed. Although the foot motion with this machine is elliptic and several records have been broken on it in the past season, there is no sign that its type will meet the public's approval. Its appearance seems to be against it.

#### Miscellaneous Details.

The number of new patterns of acetylene lamps which were announced for exhibition is astonishing, almost approaching in multitude those which this country will produce. Tricycles have reached to that point of recognition by the public that they are now made by one or two makers in more than one grade. One model is designed to be propelled by a cantering motion in imitation of horseback riding. It is for adults. The Esmond saddle which has a floating motion, laterally as well as lengthwise, is commented upon with praise as introducing a pleasing degree of comfort by new means. The principle upon which it is built has already been emulated by several American inventors who have obtained patents for similar designs. Another new departure in saddle making is the use of woven wire for the seat. The Gordon company offers a brazing composition which seems to be especially intended for repairmen, as it is warranted to flow spelter at a low degree of heat. One of the most interesting of these minor matters is an attempt to discard the monkey wrench by providing every hexagon nut on the bicycle which is ordinarily operated by this tool, with a square hole. Presumably these nuts must be made somewhat thicker than ordinary nuts of the same bore so as not to reduce the number of threads that determine its binding-effect. Several cycle manufacturers show a disposition to abandon the cotter pin for crank fastening, being probably influenced in this direction by American competition, but again the cotter is employed for securing the eccentric chain adjustment device to the fork end fitting. One eccentric adjustment device which seems especially neat is located in the crank bracket, but in order to avoid unsightly dimensions of the latter, it is supplemented by a reversible oval disk at the rear fork end. The disk is apertured at one end for holding the rear wheel axle. By reversing the disk, a half inch is added to the range of adjustment as obtained by the eccentric in the bracket.

#### CANADIAN DISCRIMINATING DUTIES

The Practice of Giving British Exporters a Tariff Advantage has not been Satisfactory.

Exporters of cycles and material will be interested in knowing that the effort of Canada by discriminating tariff duties to divert its import trade toward Great Britain and other countries that admit Canadian products at low duties, or none

at all, has not been in operation long enough to afford results that are decisive. but the results that have been attained are a great disappointment to Canadian and English statesmen who are trying to knit the British empire together into something like a customs union. They cannot greatly surprise persons who have studied the results of our reciprocity experiments and have learned from them that a small cause often has no effect whatever, instead of a small effect, as one might have inferred before watching the result, or its absence, of these small tariff influences.

It is true enough that a small difference will turn the course of trade. But the tariff is not the only item in the cost of goods. It is usually secondary to the selling price in the country of production, sometimes a very small part of it, and the concession in reciprocity and retaliatory tariffs is usually but a part of this part. Its relation to the cost of goods is therefore small, and while it is quite enough to divert the course of trade if all other conditions are the same, it seldom happens that all the other conditions are the same.

In August, 1896, the Canadian duties were the same on commodities from this country and from Great Britain; in August, 1897, the latter had an advantage of 12½ per cent, and in August, 1898, an advantage of 25 per cent.

#### STRETCHING ALIEN LABOR LAW

Ruling of Our Immigration Bureau Regarding Commercial Travelers Objected to by Canadians.

Washington, Nov. 28.—The Manufacturers' Association of Canada has drawn the attention of the Anglo-American Commission, now sitting in this city, to the recent rulings of the United States Bureau of Immigration, that the commercial travelers of Canada fall within the restrictions of the alien labor law, and that they cannot carry on their work on this side of the border. A large Canadian manufacturing firm, with branches at Toronto and Buffalo, recently submitted a statement to the Immigration Bureau as to the work of its salesmen on this side of the border, in selling both Canadian and United States goods. The answer of the bureau was that as the salesmen were Canadians they came within the operations of the law.

In bringing the matter before the Anglo-American Commission the statement is made that a large number of commercial travelers from the United States have regular routes through Canada, and that if this country intends to exclude Canadian salesmen it will be necessary to retaliate by excluding American salesmen from Canada. This exclusion will work a great hardship on bicycle, tire and sundries manufacturers, who have numerous agents traversing Canada in quest of orders. Efforts will be made, however, to have the restrictions removed on both sides.

#### Another Phantom Bicycle Trust.

An opium-smoking correspondent of an eastern daily paper is to the fore with a story which credits eight or ten of the large bicycle makers with the intention to pool interests, open retail stores in all big cities, and gather unto themselves all the business of the country. It is a favorite pastime with irresponsible contributors and credulous editors to dish up this harmless fiction two or three times a year to their hungry readers. But this time they show progress in work, for they have seized upon a corporation known as the Federal Bicycle Company and woven its name in the romance. Warming to their subject the nimble newspaper men have decided that with "the inability of independent retailers handling

one or two brands that are not so well known, and by working in harmony and under reduced expenses, the trust can make and sell bicycles so cheaply that in a year or two it will be in control of the industry." The trade endures the lucubrations of these gentry with a philosophic fortitude which compares favorably with that practised by the old woman of Syracuse, who declared herself content with the rule of the Tyrant Dionysius for fear he should be succeeded by the devil himself.

#### The Philadelphia Cycle Show.

Philadelphia, Nov. 28.—The forthcoming local cycle show under management of the local cycle board of trade promises to be much more successful financially than was that of last February. The committee in charge of the last show was antagonized by the national organization of manufacturers and the demands for space were disappointingly small. This year, however, President Brewster and his conferees will have a "free foot," and local agents handling machines manufactured by members of the national body will not be prohibited from exhibiting. The questions of date and a suitable building for the show are now engaging the attention of the board of managers. As regards the building, the choice has simmered down to the First and Second Regiment armories. The former is small, but is only a few blocks distant from the business center; the latter is 30 per cent larger than its rival, but is three miles uptown. The decision of the board will be announced the coming week.

#### Answer in Election Bet Case.

The answer of O. G. Staples, the garnishee in the case of the Bellis Cycle Company of Washington, D. C., against W. W. Marmaduke and others, as the winner of an election bet, was filed November 21. It was sought to secure these alleged funds in connection with a judgment at law, secured some time ago. In his answer Mr. Staples declares that he is not indebted to the defendants; that he has no goods, chattels or credits of the defendants; that no money, check or security has been deposited with him by the defendants; that if any money, check or security has been placed in the safe at the National Hotel it was not placed there in the custody of Mr. Staples, but by other persons, and without his authority or assent.

#### To Organize Chicago Cycle Workers.

President J. F. Mulholland of the Bicycle Workers and Allied Trades International union has made arrangements to send organizers into the Chicago district to organize bicycle workers. He believes the demand for bicycles next year will be unprecedented, and says the workers should have their share of the profit which will be made by manufacturers. "By organization," he says, "we can maintain a proper rate of wages and protect the interests of fair employers." A mass-meeting of bicycle workers will be called in a few days and efforts made to restore the various unions in the city to their former strength and influence.

#### State of Trade in Germany.

The directors of two German cycle making concerns have just made reports to the shareholders. One firm, which paid a dividend of 7 per cent last year, is unable to pay anything at all on the past season's trading. The other, which paid a dividend of 29 per cent last year, will pay 24 per cent this year.

An inventor at the Piraeus, Greece, has taken out a patent on a new chainless bicycle.

## UNUSED FORK CROWNS

### Chance for Originality and Variety in Forgings and Castings for Three-Crown Construction

In the constant race for novelty among American bicycle makers the fork crown has played an important part. The variety of fork crowns that have been tried is great indeed and each season sees new attempts to change, if not to improve, that part of the bicycle frame. Even the smallest builders have endeavored to use distinctive crowns and no sooner has one crown become popular than does someone try to change it enough to make a noticeable difference. Perhaps one reason why the fork crown has been changed so much is that it can be changed with very little expense to the builder and without altering any other specifications of the models produced. It is but a comparatively small matter to have a distinctive fork crown made, and the fact that the crown is a very noticeable part of a bicycle helps to make such a change desirable in the eyes of the novelty seeking builder. But in the United States where frame patterns are changed with a rapidity which seems scandalous to the conservative English maker, there is still one crown which has never been used. It is an English crown and was originated by a very conservative firm.

#### Combination of Satisfactory Types.

It is a combination of the double plate and the old Humber crowns, as is shown in Fig. 1. The Humber crown, while it was never in universal use, has always been used with success wherever adopted.

Just why it was dropped is hard to tell unless it be that it was not considered dressy enough to withstand the rapid conquest of the arch crown. Makers who have used the Humber crown will without an exception say that it gave entire satisfaction and that for all around service it could not be outdone. Cycle workers who have built forks with Humber crowns will all agree that there is no crown which is easier to build and to build accurately. The combination crown has the light open appearance of the double plate crown and the substantial qualities of the Humber. It is all in one piece and the holes for the reception of the lower end of the fork stem and the

upper ends of the blades may be accurately placed. The added weight over the double plate crown is slight, and the complete sleeve of metal surrounding the upper end of the fork blade gives good brazing surface at those points. All brazing can be done from the outside and as it is possible to run brass in around the fork blades at the lower side of the crown until it begins to run out of the top, it is not necessary to heat the point above a white heat in order to watch the spelter run underneath the metal. It is not necessary to make the crown more than three-fourths of an inch in thickness, thus allowing the steering head of the bicycle to be set close down over the front wheel, an item of importance in these times when many manufacturers are endeavoring to use low frames without having to accompany them with excessively short heads.

#### Little Machining Required.

Doubtless the most inexpensive manner of constructing the crown is to cast it, though of course it is very easily forged. With careful pattern making and core making, however, much, if not all, machine work may be done away with. At least the outside need not be machined nor the oval holes for the reception of the upper ends of the fork blades. In Fig. 3 is shown the manner of casting the crown, if it be cast. If all of the holes be cored six core prints should be placed on the pattern, these prints being marked in the illustration, A and B. The prints, A, each extend about three-eighths or one-half inch above and below the crown pattern, one core being used to make each of the oval end holes. The open space in the center of the crown, between the upper and the lower plates, is made without a core, the crown pattern being symmetrical and the mold parted at its center. The open center being formed in the mold by the molding sand, the core to form the holes for the fork stem cannot be in one piece extending clear through as the cores provided for by the prints, A. Two cores must be used, seatings in the mold being made by two independent prints, B, B, which do not extend through the center of the pattern. The prints, B, must be long enough to support the projecting ends which form the holes in the casting. To be on the safe side they should be at least three-quarters of an inch long in addition to the length which acts as core. If the patterns are well made and if the cores match them there is no need of machining the holes, a little filing to remove rough edges on the casting being all that is necessary. If it is desired to bore the holes for the reception of the fork stem, the prints, B, will of course be omitted and no cores used at those points. Otherwise the casting of the piece will remain the same.

#### Substitute for Arch Crown.

In the rapid adoption of the three crown construction, cycle designers have seemingly forgotten that it is possible to use other crowns than the arch for the rear stays and forks. Without going into the matter of the desirability of the three crown frame, it may be safely said that other crowns might be used as well as the arch, thus giving the novelty seeker a chance to make his frame distinctive in construction without departing from popular lines. In Fig. 2 is shown the rear end of a frame in which the combi-

nation double plate and Humber crown is substituted for the common arch crown. The crown being lighter than the average arch crown and being, as has been mentioned, of easy making and of ready adaptation to fork building, it can be adapted to the rear end of a frame without any trouble. It would lend the frame a clean cut light appearance and could be used with good taste in either a flush or an outside joint frame.

#### Crossed Rear Forks.

A rational novelty in rear fork design that has never been tried, to the public's knowledge at least, is shown in Figs. 4, 5 and 6. In Fig. 4 the plan is shown incorporated in a flush joint rear frame. The effect is that of the two rear fork tubes crossing each other ahead of the rear wheel. The design is offered as a change from the common cranked rear forks and from the three crown construc-

tion. It adds no perceptible weight over the three crown construction, is just as strong, and perhaps a trifle stronger than the ordinary three crown make-up. Its appearance is catchy. There are two practical ways of making the fitting. Perhaps the best is to cast the hollow curved cross in one piece together with the hanger bracket, as is shown in the sectional view in Fig. 5. Straight rear fork tubes of either round or D section may then be placed on the rear ends of the cross. The second way is to make a separate cross piece as in Fig. 6, which may be used with a regular four lug hanger. The latter method has the commercial advantage of allowing the parts maker selling the piece to put it in all supply houses handling some popular make of hanger, the cross piece being proportioned to fit that hanger. The maker of the hanger will not then be called upon to turn out brackets with the cross extension made integral with the bracket. It is obvious that the forward ends of the cross must be accurately distanced in order that they will exactly coincide with the lugs, D, on the hanger, there being but little chance to spring either the hanger lugs or the branches of the cross. The part is easy to cast, it being made in a simple two part flask with one core which makes the hollow complete throughout all of the branches. The frame builder will have no difficulty in using the piece, as when it has been fitted to the hanger and the straight rear fork tubes placed on its rear branches there is but little chance for the rear frame to be out of true.

The wood rim works at Martinsville, N. Y., have been destroyed by a fire believed to have been intentionally started by a gang of incendiaries operating in North Tonawanda. The factory has been idle for a long time, but was soon to be started up again.

TRADE MARK

# To Remington Agents

For 1899 The Remington Arms Company will make the DUNLOP DETACHABLE TIRE their regular equipment on their models listing at \$50 and \$35 at no additional wholesale or retail charge. ❁ ❁ ❁ ❁

## RECENT PATENTS

## Detachable Tire With Dovetailing Edges—Triple Steering Head and Bar—Factory Adjusted Hub

**Graham's Tire.**—This is a "tubeless" tire with mechanical interlocking of the meeting edges. One side of the tire is secured to the wheel by cementing a flexible flap to the rim. From the same edge of the tire but on the inner side extends another flap made of soft rubber, with a strip of canvas inclosed. The flap also contains a wire which is designed to be tightened by a ratchet arrangement, but the inventor does not specify how

this is to be done. The opposite inner edge of the tire has a similar, but thinner, canvas-reinforced soft flap. Interlocking devices made of aluminum and of the shape shown in the illustration are secured along the edges of the intermediate canvas fabric of the tire, projecting on the free side of the tire beyond the loose edge of the outer tire covering. The inflation valve extends through the tire just beyond the edge of the wheel rim, so that creeping of the tire will not affect it. The inventor says that the wire in the inner flap is tightened before inflation, but how the interlocking of the tire edges may then be accomplished seems difficult to comprehend. The wiring is not included in the patent claim, however. The inventor is W. A. D. Graham, of Toronto, Can.

**Roller Gearing.**—The general arrangement of gear-wheels is similar to that of bevel-gear bicycles. The front driving wheel and the rear driven pinion are alike in construction and are provided with rollers. The shaft-pinions have milled teeth. Both of the roller wheels have concentric flanges on their working faces and pins are inserted at equal in-

tervals connecting the two flanges. The inner ends of the pins are conical and fitted on conical sockets in the inner flanges. The outer ends are cylindrical and reach through holes in the outer flange flush with the same. A band encircling the flange holds them all in position. On the pins are placed roller sleeves. Each pin is grooved longitudinally to provide for lubrication by plumbago or other means. The conical sockets in the inner flange extend through the flange so that

the pins can be driven out by striking their inner ends when the band surrounding the outer flange is removed. This serves repair purposes. The pinions on the shaft are adjustable, being placed on between two nuts and splined to the shaft. The key for splining is as long as the bore of the pinion and slides with the pinion in adjusting the same. The patent claims have reference to the construction of the roller-wheels only. The inventor is Charles A. Hennitke, of Buffalo.

**Spiker's Handlebar.**—For the purpose of providing a handlebar which may be adjusted up or down by the rider without changing the inclination of the grips, the inventor proposes the construction shown in the illustration, which consists in a pair of guide tubes brazed to the fork sides at their lower end and gathered in a socket at the upper end, the socket in turn to be secured to the forkstem. A distance plate secures the position of the guides in advance of the head tube, as shown, by which position a wider angle is obtained for steering than with the usual "triple steering head," so-called, of the "Referee" or "Lyndhurst" type. The middle portion of the handlebar is flattened and has seats or eyes for the guides, and to this portion is secured at one point a clamping plate with seats

adapted to be pressed against the guides from the front. The ends of the clamping plate are free and reduced to form lugs which extend into sockets in the ends of sleeves, shaped like grips, mounted on the adjacent tubular portions of the handlebar. The sockets are turned to form eccentric cam faces, so that a twist of the sleeves will squeeze the lugs tightly against the bar and the latter against the eyes or seats in the flattened portion of the handlebar. Thus the rider may, by taking hold of the sleeve-grips and twisting them, release the bar from the guides, lower or raise it, and again fasten it without removing his hands. Whether this desirable object is sufficiently important to call for so elaborate an arrangement as proposed will probably be doubted, but the suggestion of employing an eccentric cam socket for quick fastening and unfastening may be a hint for makers of grips, tool boxes, pumps, lamps or anything else which it is desired to secure removably to any one of the frame tubes. The possibility of accidental loosening by vibration should probably be considered when the cam face is of metal and contacts with metal. The inventor of the handlebar illustrated is W. C. Spiker, of Cadiz, O.

**Crank and Axle.**—The axle has a reduced square extension eccentric of its

axis, and this extension fits in a square hole in the crank boss. The eccentric portion is preferred mainly because thereby torsional stress on the axle is reduced. The axle is further provided with a screw-threaded hole into which screws a screw with a head large enough to extend over the face of the crank boss and operate to draw the crank tightly on to the axle, crank and axle being tapered correspondingly. The screw head has holes for applying a spanner. The crank has a screw-threaded hole of the same diameter as the hole in the axle extension, and this leads up to the shoulder on the axle. If the crank is to be removed from the axle, the headed screw is removed

from the hole in the axle and is screwed into the hole in the crank, where by impinging against the shoulder on the axle it serves to drive the crank off its taper seat. The inventor is Albert J. Perks, of Springfield, O.

**Spring Hub.**—The hub is enlarged beyond the usual size of bicycle hubs and revolves around an inner drum upon adjustable ball-bearings. The ends of the drum are closed by plates which have slots extending across the central portions without reaching the edges. These slots are normally vertical, as described by the inventors, but in practice should probably be placed at an angle corresponding to the average direction of jolts, say at an angle of 45 to 60 degrees. The axle is cranked so that the cranked portions slide in the slots and the central portion of the axle, which is broadened, is normally above the axis of the drum. This arrangement is for the purpose of providing room for longer and more yielding springs within a given size of hub. The flattened portion of the axle has four holes for the passage of guide bolts. Two of these bolts have large screw-threaded heads which are screwed into holes in the drum. At their outer ends internally and externally screw-threaded collars are fitted. Being adjustable, these collars serve to adjust the tension of the helical springs bearing upon them, so as to make the axle ends extend from the center of the drum plates on both sides when the rider is seated. It seems that the range of adjust-

ment would not be large enough to offset great variations in the weights of different riders, but it may be sufficient to offset accidental variations in the strength of the two springs so as to insure a horizontal position for the axle. The helical springs between the axle and the collars absorb the jolts of ordinary riding. Rebound-springs are placed around the same bolts between the axle and the bolt heads. The two central bolts are surrounded by springs which come into ac-

tion only in case of unusually severe jars when the axle may approach the lower limit of its movement. To the cranked portions of the axle, outside of the drum plates, are attached plates for excluding dust from the slots, and flanges are secured to the hubs to protect the ball-bearings against dust. The inventors are Teodor Kierakowicz and Joseph Lucas, of Chicago.

**Chain Adjustment.**—The construction of this device is so plainly shown in the accompanying illustration that verbal description is unnecessary. Being arranged

wholly on the outer side of the fork end fitting it does not interfere with access to the wheel hub and bearing cones. The inventor is Leo Melanowski, assignor to the Crosby & Mayer company, of Buffalo.

**Adjusted Hub.**—The main object of this invention is to provide a bicycle hub which may be properly adjusted in the factory where it is made and afterwards sold and handled and attached to a bicycle frame without interference with the adjustment given to it. The illustrations show a horizontal cross section of a front hub and the sprocket end of a rear hub. In the front hub the barrel has at each end a flaring flange for spoke attachment and the barrel ends are internally screw-threaded to receive ball-cups. Ball-retaining spring washers are used in these cups and have notches in the periphery designed to facilitate the access of lubricating oil to the balls. The cones are turned outwardly and have screw-threaded extensions to which are applied nuts that serve as shoulders against which the fork stems are stemmed tightly by the holding nuts, which are screwed to the cone extension and not on the axle, as customary. The cone when adjusted is secured in position by a screw-plug with a square head which is screwed into the end of the cone extension abutting against the axle end. The middle of the axle is provided with a notched collar and a key piece is held in a hole in the barrel by means of a flat spring, so that by press-

ing the key piece in against the resistance of the spring a tooth on the key piece will engage one of the notches and lock the barrel to the axle. The assembling of the hub is described as follows: Antifriction-balls have been placed in the cups, one of the said cups is screwed into the end of the barrel solidly. Then the shaft, having the cones screwed on to its ends, is inserted into the barrel from the end in which no cup is yet screwed, and the threaded end of one of the cones is projected out through the central holes of the bearing-cup until the bearing-surface of the cone comes in contact with the friction-balls of the inserted cup. The other cup is then screwed into the opposite end of the barrel, allowing the threaded portion of the other cone to extend out through the central opening in it. On the threaded ends of the cones

the inner nuts are then screwed tightly, after which the hub may be placed into the bicycle fork, to which they may then be tightly secured by screwing on the holding nuts. The cones are kept from turning in the bicycle fork by means of two flat sides, so that by revolving the shaft when the cones are thus held the cones are driven outwardly or drawn inwardly of the hub, according to the direction in which the shaft is turned, the threaded ends being provided, respectively, with right and left threads. The revolution of the shaft or axle is effected by locking the barrel to the shaft, so that the shaft may be revolved with the barrel of the hub in either direction required. When the cones are adjusted in this manner to the positions required, the plugs are screwed into the respective ends of the cones until they set against the respective ends of the shaft firmly enough to prevent the shaft from turning in the cones. This adjustment may all be effected before the hub is inserted into the vehicle; but when it is thus done it is evident that the cones should be held from revolving by an appliance which would take the place of the fork of the bicycle to which the hub is adapted to be attached. The inventors are Walter D. Snider and Albert G. Snow, of Scranton, Pa.

**Pedal Tread.**—Into a tread of lead or other soft metal such as aluminum is rolled a gritty substance such as emery, carborundum, etc., which will prevent the tread from wearing smooth and slippery. Instead of rolling the grit in it may be molded in. The inventor is Elbert B. Phillips, of Cleveland.

The saddle design shown in the accompanying illustration has been patented

for the Garford Mfg. Co., of Elyria, O., on application filed October 29, 1898.

**WHAT SPECIFICATIONS ARE**

As Now Written They Are Only Such in Name—Cover Many Sins.

In many cases specifications have been called upon to cover a multitude of sins, both sins of omission as well as "commission." Specifications, if drawn intelligently and compiled correctly, are of great assistance to both the purchaser and the manufacturer, by expediting business transactions, and also in preserving friendly relations between those parties, through avoiding misunderstandings, etc. But if drawn with a view to favor certain articles under the pretense of being fair to all, they often lead to disagreeable consequences and serious disputes, says a writer in Riehle's Digest of Physical Tests.

The definition of the word specifications, as given by Webster, is "A written statement containing a minute description or enumeration of particulars, as the terms of a contract." Many specifications, especially those sent out by manufacturers, are in reality only descriptions of their particular productions, and have no right to be honored by the term specifications. For instance, the descriptions sent

out by some bicycle manufacturers and by them called specifications—their only claim to the name lies in the fact that they have the different paragraphs headed by type of different color and of larger size.

**METALLIZING WOOD**

After Long Immersion in Chemical Solutions Wood Can be Polished to a Metallic Lustre.

In the French Journal Les Mondes, a process for metallizing wood, invented by one Rubennick, is described as follows: The wood is immersed for three or four days, according to permeability, in a solution of caustic lime, at a temperature of from 75 to 90 degrees Centigrade. From there it is placed at once in a bath of hydrosulphate of calcium, to which, after 24 or 36 hours a concentrated solution of sulphur and caustic potash is added. This bath lasts about 48 hours, at 35 to 50 degrees. Finally the wood is treated for 30 to 50 hours to a bath of acetate of lead, also at 35 to 50 degrees. It will be seen that the process requires considerable time, but the result is surprising.

After having been dried to a moderate temperature, the wood thus prepared shows, when polished, a brilliant metallic lustre. This lustre can be heightened still more by rubbing the surface with a piece of lead, tin or zinc, and then polishing it with a glass or porcelain burnisher. The wood surface then assumes the appearance of a genuine metallic mirror, and is very solid and strong.

**Fibrous Puncture Repair Material.**

One of the puncture mending methods shown at the English Stanley show is attracting attention. It is designed to be used for double tube tires, and it is the idea that punctures shall be mended without removing the tire casing, but its adaptability to single tube tires is obvious. The tire manufacturer's co-operation is required, for the inner tube is supposed to have been filled at the time of manufacture with a specially prepared fibrous material which loosely fills the entire air tube, but weighs only one ounce. Being fibrous, the material does not interfere with inflation or deflation. When a puncture is located a small quantity of rubber solution is injected and the tire is depressed against the rim at the point of injection, so as to make the fibrous material, combined with the rubber solution, stick to the punctured spot. By proper manipulation it is said that the fibrous paste which is formed will adhere only to one side of the tire.

**Hardening Cast Iron.**

The following is published as a recipe for hardening cast iron. We are not responsible for it: Take a half pint of vitriol, one peck of common salt, half a pound of saltpetre, two pounds of alum, a quarter of a pound of prussiate potash, and a quarter of a pound of cyanide potash; dissolve in ten gallons of water. Be sure that all the articles are dissolved. Heat the iron to a cherry red and dip it in the solution. If the article needs to be very hard, heat and dip the second, and even the third, time.—American Machinist.

**Tires Kept Dark in Winter.**

It is asserted that light does more to injure tires during the winter than anything else. A chemist who has made some experiments in this line says tires will not harden during the winter months if kept in the dark.

One-fifth of the 30,000 patents taken out in England in 1897 related to cycles and cycle accessories.

## PIPER & TINKER WAGON

### Steam Vehicle of the New England Group—Automatic Regulation of Water Feed

Piper and Tinker, of Waltham, Mass., began the construction of steam wagons in 1895, and so far, November, 1898, have built three vehicles, one of which has been sold.

This wagon has two simple engines, working on 90 degree cranks on the same shaft. The cylinders are 2½-inch bore by 3-inch stroke, and are supplied with steam by a water tube boiler, Piper and Tinker's patent. The peculiar feature of this boiler lies in the introduction of flues or fire tubes, ½-inch diameter, inside the vertical members of the water tube sections. These water tube sections are made up of copper tubes, 1¼ inches outside diameter, both horizontal and

Fig. 1—Latest Piper & Tinker Steam Wagon.

vertical, the vertical tubes containing 1½-inch vertical fire tubes, as mentioned. The separate water tube sections are all brazed together, and the 9 sections are connected to each other by copper tube headers, 1¼ inch diameter. The thickness of all the boiler tubes, flues, and headers is No. 20 B. & S. gauge. The vertical height of the water tubes over the headers is 21½ inches, hence the ½-inch vertical fire tubes are 43 diameters in length, which is very much longer than some other makers consider the extreme useful limit for vertical fire tubes. The fuel is gasoline, admitted to horizontal burner tubes through independently adjustable needle valves, the valve adjustment being shown in part in Fig. 3. The fuel is passed through the needle valves in liquid form, and is vaporized by the heat of the burner tubes, which have a head at the end opposite the needle valve, and are imperforate on the under side. The upper half of each burner tube circumference is pierced with holes 1-64 of an inch in diameter—spaced ½-inch, c. to c., and staggered; the draught is natural, and the fire is silent. The fire is automatically regulated by the steam pressure acting on a diaphragm. The boiler is tested to 500 pounds hydraulic pressure and is fitted with a pop safety valve, set at 165 pounds, and the regular working pressure is 160 pounds. The wagon which was sold weighed 900 pounds, had wheels 28 and 30-inch diameter, with Newton tires, 1⅞ inches diameter in front and 2 inches diameter in rear, inflated to about 90 pounds air pressure. The gauge of the wheels was 48 inches, and the wheel base 60 inches. The engines were vertical, and arranged as shown in Fig. 2. The valves are plain D-slides, operated by link motions of ordinary form, and hence, of course, the engines run backward the same as forward.

The Piper and Tinker wagon shown in the accompanying engravings is of later manufacture. It has the boiler and burner as described. The total weight is given as 700 pounds. The wagon body is very peculiar in appearance and has a very discomposing effect on horses. It may be taken as proved that it is not the spectacle of a wagon running without horses which alarms the equine mentality, but the peculiar shape of the wagon. The Stanley and the Whitney wagons are of ordinary forms, and but very few horses pay any attention to them. The Cross wagon, of Providence, is of peculiar shape, and produces temporary insanity in almost every horse that it meets; the Piper and Tinker is also of unusual form, and affects horses in the same way. If it is true, as these four instances agree in showing, that it is the strange outlines of automobiles which so dangerously alarm horses, then designers should keep close to ordinary vehicle forms, in spite of the loud and often repeated demands for "originality" made by some of the automobile journals.

#### Metal Construction and Shapes.

Undoubtedly the wagon which alarms horses least will have one great point in its favor, as it is one of the most annoying things in the whole round of automotor vicissitudes to have about all the horses in sight standing on their hind legs and pawing the air with their fore feet, or else making mad efforts to run away with the much perturbed occupants of the vehicles to which they are attached.

The Piper and Tinker wagon body owes its unique appearance to the fact that it is constructed of aluminum, having the panels painted black and the retaining strips nickel plated. The dash board is greatly thickened to make it serve as a water tank and the great length of the

Fig. 2—Rear View, Showing Engine Uncovered

boiler tubes causes the passenger seat to be placed high. The use of aluminum undoubtedly secures lightness of construction, but it would require a very large outlay for dies and forming tools to establish the manufacture of carriage bodies in ordinary shapes in any sheet metal.

The wheels of the last Piper and Tinker wagon are 28 and 30-inch diameter, with Kangaroo tires of 1⅞ and 2 inches diam-

eter, with 90 pounds air pressure; gauge, 48 inches; wheel base, 60 inches.

The arrangement of the engines is pretty well shown in Fig. 2, which is a rear diagonal view, with the vertical cover of the engine casing removed.

The cylinders are 2½-inch bore by 3-inch stroke, and the crank shaft is directly above the rear axle, a short vertical chain leading from the crank shaft sprocket to the large sprocket secured to the compensating gear case; the gear reduction is 4 to 1. The engine frame appears to be carried directly by the rear axle support, without intervening springs, and there appears to be no means of adjusting the chain tension. The valves are D-slides, face each other, are in independent steam chests, and are moved by ordinary links, controlled by a latched lever and notched quadrant in front of the seat. The throttle valve is handled by a short horizontal sliding bar, just in front of the link quadrant. The steam gauge is just beyond the quadrant, and there is another gauge at the rear of the tank-dash board. The brake treadle is above the foot board and operates two band brakes, one on each rear wheel hub.

Piper uses an original form of body carrying spring, made of one single piece of flat steel, twisted into full circles at the ends, and offset sidewise, so that the up-

Fig. 3—Needle Valve Burner Adjustment.

per and lower parts can pass each other, all as shown in Figs. 1 and 2.

The weight of the water tube boiler is said to be 100 pounds, with 65 square feet of heating surface, and a water capacity of 4 gallons.

Fig. 3 shows the burner regulators; the notched wheels, attached to the screw-threaded needle-valve stems are retained in place after adjustment by spring plunger dogs, which catch into the notches of the valve stem wheels; the numerous short open-ended horizontal tubes, located in two rows, one above the other, between the needle-valves, serve to admit air to the closed casing which contains the boiler and the burner tubes. All of this work is covered up by a removable door, as shown in Fig. 1.

#### Feeding of the Boiler.

Fig. 4 shows the well known but very seldom used gravity water feed, which Piper and Tinker employ for feeding their boilers. As a matter of course water finds its level, so long as the whole mass of water is under the same pressure. Hence, suppose the horizontal cylindrical gravity tank, T, T, Fig. 4, is connected with the boiler at the proper level, by a pipe on top, marked P, and by a similar pipe, not shown, leading from the bottom of the gravity tank to the boiler, both these pipes from the tank to the boiler being fitted with valves, so that communication between the tank and the boiler can be opened and closed at will; suppose, also, that a supply hose, H, is led from the bottom of the higher water supply tank to the gravity tank, T, this hose connection being also through a valve which may be opened or closed at will; with these connections, let the valves in the pipes leading from the gravity tank to the boiler be closed, and the hose valve be opened; water will then enter the gravity tank and condense the steam if any be therein, and completely fill the gravity tank, T. Then if the hose valve be closed, and the boiler connection

## The Claus Bar

==the Bar the People Want.

Thousands of people have opened their hearts to the Claus Bar.

When the proper time comes they will open their pocket books.

We are teaching thousands more that the Claus Bar is:

The only bar that can be adjusted without a wrench.  
The only bar that retains its width at all adjustments.  
The only bar in which all parts interlock.  
The only bar with an adjustment that will not wriggle.  
The only bar that can be adjusted while you ride.  
The only bar that marks the high grade wheel.  
The only bar with a guarantee that never expires.

People will insist upon receiving the Claus Bar.

They will turn away from a wheel that is not equipped with it.

You can't afford to turn away customers—turn away prosperity.

Tell your manufacturer that you want the Claus Bar—that you will take no other.

Write for our prices and open your arms to prosperity.

The

## Claus Handle Bar Mfg. Co.

valves be opened, the water in the gravity tank, being uniformly exposed to the boiler pressure, will run into the boiler, if the water level in the boiler is below the bottom level of the gravity tank, and the gravity tank, T, will be filled with steam. Then suppose the boiler communication valves to be both closed, and the water admission valve to the gravity tank, T, to be opened, water will again run in and fill the gravity tank. Piper and Tinker arrange a slowly revolving cam to open and close these three valves properly, and thus keep the water at a constant level in the boiler, provided that the valve operating cam is revolved rapidly enough. It is impossible with this arrangement of parts to over-feed the boiler, and as the boiler feed has its valves actuated by positive mechanism it is more likely to operate than the ordinary force pump, which has its valves moved one way by gravity. While this boiler feed

Fig. 4—"Gravity" Boiler Feed.

takes much more steam to operate it than is required to do the same work with a force pump, it has the merit of requiring no attention from the driver to keep the water level in the boiler always the same, which is the first requisite in steam production and use.

The Piper and Tinker wheels are on ball bearings. All other bearings are plain. The compensator sprocket appears to be exposed. The chain sprocket on the crank shaft has six teeth, working to 24 teeth on the compensator sprocket. The downwardly opening tube, E, Fig. 2, is the exhaust pipe, and the bottom open end of this tube, which appears to be flexible, is carried to within a few inches of the ground.

The young men who are constructing this vehicle are doing wholly original work, and will undoubtedly reach practicable solutions of many of the difficult problems of the mechanically propelled vehicle very soon. HUGH DOLNAR.

### CARE OF FILES

#### Re-Sharpener Clogged Files by Chemical Solutions - Handles Secured by Long Ferrules.

If files have been used for working on iron and are clogged with iron-filings which helps the natural wear on the file in the work of making the tool smooth and worthless instead of rough and useful, the file should be immersed for a short time in a dilute solution of sulphate of copper. The solution will completely remove the objectionable iron filings without affecting the file itself. Zinc filings can be dissolved with dilute sulphuric acid. Files which have been used in filing copper or in filing the spelter from around frame joints, may be cleaned and sharpened by dipping in dilute nitric acid. It must be understood that, before the files be immersed in the acid, as much of the coarser filings as possible be removed with a file cleaning brush, and that the files be cleaned so that there shall be no grease of any kind present to hinder the action of the acid. Grease can

be best taken from the files by treating them in a dilute caustic alkali.

The frequent breaking of file handles and the regularity with which files pull out of their handles while being used makes any scheme which will lessen these evils very acceptable to the users of files. It has been discovered that if the brass ferrules on the file handles be made from twice to three times as long as those commonly found on commercial handles, there is much less liability of the handles breaking, and that the files do not have as much tendency as commonly to pull out. The long ferrules cost more than the short ones, but the saving on account of fewer broken handles much more than balances this, while the security of the files in the handles makes the long ferrule very attractive to the workman.

### POWER OF VEHICLE ENGINES

#### Figures Indicating Unprecedented Proportions Between Dimensions and Power.

The following particulars in regard to the powering and gearing of the Stanley steam wagon, which took part in the Charles River Park contest, may be of interest to steam engineers:

Boiler shell, 14 inches diameter by 13 inches high; material, copper; No. 20 Brown and Sharpe sheet metal gauge in thickness; 306 tubes, copper, 1/2 inch diameter, 13 inches long, No. 20 B. & S. gauge; fuel, gasoline; cylinders, a pair of simple engines, 2 1/2 inch bore by 3 1/2 inch stroke, plain eccentric valve motion, plain side valves, no link, fixed cut-off at about 9-16 stroke. The speed reduction from the engine shaft to the compensating gear box is 2 1/2 to 1, 12-tooth sprocket on engine shaft, and Baldwin separable chain to a 30-tooth sprocket on the gear box. The driving wheels are 28 inches in diameter, with suspension, laminated wood-rims, and 2-inch Hartford single tube tires.

Running a mile in 2:11, the engines made 720 by 2 1/2, or 1,800 revolutions, and the number of exhaust was 7,200. The

engines made a little under 837 turns per minute. The boiler pressure was probably about 140 pounds, and as all the connections are very direct and short, it seems that the mean effective pressure on the pistons should be little short of 80 pounds. However, the combined piston area is 9.8 square inches, and the piston travel was 487 feet per minute, going something like 11-horse power nominal. This seems incredible for a boiler of the dimensions given, and it seems therefore probable that the mean effective pressure must have been much below the 80 pounds assumed.

### Cellular Acetylene Gas Generator.

An acetylene gas generator, invented by John Sharp, of Ottawa, Canada, is claimed to be a distinct advance beyond other generators. Safety, economy, convenience and freedom from odor and general control over calcium carbide are said to be insured by it. The gas is generated from small cells in which the carbide is placed. These cells are connected with water-tanks. The apparatus is so arranged that the supply of water and calcium carbide is automatically regulated. By the mere turning of a tap the whole may be shut off and the generation of the gas instantly stopped. Nor is any gas wasted, no exhaust pipe being necessary for the carrying off of surplus gas. An indicator shows which of the seven cells the gas is being produced from, so that persons occupying the room lighted can tell by simply looking at this register whether the cells are empty or not. The generator may safely be opened in the light of a lamp or candle. It is to be placed on the market as soon as arrangements can be made for its manufacture.

### Motor Vehicles in Spain.

Motor vehicles are making their way into conservative old Spain, and there are now twelve motor bicycles and four motor cars in use in Madrid. An automobile club is about to be formed in the capital, and this will publish a bi-weekly paper devoted to motorcycle topics.

### REMARKABLE GROWTH OF OUR EXPORT TRADE.

The remarkable growth in our exports of manufactures is illustrated by the following table which has been prepared by the Treasury bureau of statistics, showing the exports of leading articles of manufacture at ten-year intervals during the past thirty years. This table shows the exports of each class of manufactures whose value exceeded \$1,000,000 in the year 1898, comparing that year's exports with those of 1888, 1878 and 1868. The total export of manufactures in 1898 was more than five times that of 1868, that for 1898 being \$288,871,449, while that of 1868 was in round numbers about \$60,000,000, expressed in the depreciated currency of that date, and when reduced to the gold standard by which our manufactures are now measured would be less than \$45,000,000. In those calculations it must be borne in mind that values of nearly all articles are now less than at the earlier dates considered, so that these statements of the exports of great groups of articles, while necessarily expressed only in values, doubtless represent in 1898 a larger quantity for each dollar or million of dollars than in 1888 or 1878, and especially more than in 1868 when the values were expressed in depreciated currency.

# INFORMATION FOR BUYERS

## THE WHEELER GAS LAMP.

Acetylene gas will give perfect combustion and produce a pure flame only when all the moisture naturally present in it at the moment of its generation has been wholly extracted. In perfecting the many other details of acetylene lamps few makers have as yet given much attention to this requirement. The Wheeler Lamp Co., 220 Broadway, New York, however, is just placing in the market the Wheeler acetylene lamp, which it claims is the only lamp in the market that burns dry gas. The external form of the lamp is shown herewith, but details of the internal construction and especially of the method of filtering the gas, in which

much interest centers, have been withheld. The filtering of the gas removes all impurities as well as moisture, so that there is no accumulation of tar and lime to clog up the burner, thereby overcoming one of the common sources of annoyance with this class of lamps. The Wheeler lamp does not require a specially prepared charge, but burns any carbide; is simple in construction, easily controlled, and claimed to be absolutely safe. It is 5½ inches high, weighs 12 ounces, is made of brass, highly nickeled and has an aluminum reflector. It is strongly made, compact and graceful, as shown by the drawing. Lamps will be ready for shipment December 15. The makers intend to push the Wheeler lamp energetically and by offering a superior article at a moderate price make it the popular lamp of the coming season. Electrotypes of any size are now ready and will be furnished to jobbers for insertion in their catalogues.

## THE VELOX PEDALS.

In these days of cut-throat competition, when cheapness takes precedence over all other factors in bidding for trade, it is a pleasure to bring to notice an article designed to win favor strictly upon superiority of quality. The Velox pedals, made by the Velox Machine Works, 315 Dearborn street, Chicago, make no bid for favor in competition with cheap goods, but are designed as a suitable fitting for the very best class of bicycles. The body is forged from high grade steel. Axles are turned from the bar,

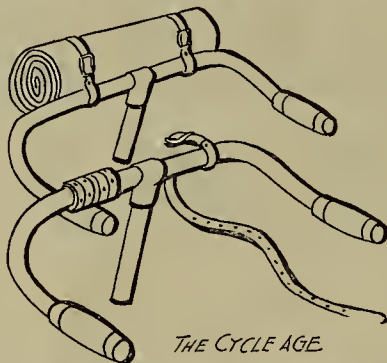

and are vertically suspended during the process of hardening, to overcome all tendency to warp and give certain and uniform results. The cups and cones are hardened by an improved process which produces superior results. To produce a finished bearing in which the line of travel of the balls will be a perfect circular path all bearing surfaces of cups, cones and axles are accurately ground in specially constructed machines designed and built by the Velox Machine Works. These machines are fitted with delicate micrometer adjustments, and grinding operations are regulated to the 1-10,000 part of an inch as to degree and size. The bearings on the axle are ground with reference to the concentricity of these bearing sur-

faces with the axis of the pedal pin. The angles of the cups and cones are made true with reference to the pitch of the threads. No balls are used that vary from the given size (5-32 inch) more than 1-10,000. The finish has been carefully carried to the same degree of excellence that marks the design and workmanship. The bearings are of the three-point type. There are two points of contact at either end of axle; at the large end a two-point cone and a one-point cup; at the smaller end the cup is contained within the end of the axle, and presents two points of contact with the balls, with one point on the adjustable cone. The large cup is threaded into the end of the barrel. By unscrewing this cup, which is finished with a hexagonal flange, the axle may be withdrawn from the body, exposing both rows of balls retained on the axle, as shown in the illustration. The cups are threaded rights and lefts, a right threaded cup screws into the right pedal, and a left threaded cup into the left. The cup is removable over the small end of the axle by taking off the retainer and dropping the balls from the race. To adjust for compensation of wear the lock-nut on the other end of the barrel is loosened and the threaded cone turned in far enough to take up lateral motion of the axle. The construction of the Velox pedal provides a ready means of lubrication with the elimination of oil holes, spring covers and other complications, it being strongly recommended that the axle be removed from the body for the application of a thin oil direct to the bearings. A groove around the axle, opposite to and concentric with the cup, is filled with vaseline or other grease, acting as an efficient barrier to the entrance of dust or grit, besides eliminating the sliding contact of two surfaces, and materially simplifying the construction. The company reports a very fair demand for pedals of this quality through the central and eastern states; and has already booked sufficient orders to keep it busy throughout the winter.

## PHOENIX BICYCLE LUGGAGE CARRIER.

Experience has taught most cyclists who venture beyond the limits of their own county a wheel that one of the most convenient ways of carrying a small bundle on

a bicycle is by means of straps buckled around both bundle and handle bars. But ordinary straps slip around the highly nickeled metal and allow the package to fall down against the head of the machine or to slip over to one side with the jolting of the machine. The Phoenix carrier made by N. H. Benjamin & Co., of Phoenixville, Pa., has a steel spring clasp riveted to each strap near the buckle to clamp around the bar and prevent slipping. These can be readily snapped on or removed. When there is no bundle to carry the straps can be wound around the bar, as shown in one of the accompanying cuts, and used as supplementary grips. The springs are of tempered steel, nickel plated and the buckles are also nickeled. Straps are of very strong and finely finished russet leather, 26 inches long. The straps complete with buckle and clasp, weigh 1½ ounces per pair and are neatly packed in a small box. More than a score of the Philadelphia jobbers carry them in stock, and they are handled by leading jobbers throughout the country.

## THE LYNDBURST ADJUSTABLE BAR.

Prices of the new Lyndhurst models are announced by McKee & Harrington, 175 Grand street, New York, to be \$50 for the standard road machines and \$60 for the racer. A prominent new feature in their construction is the patented Lyndhurst handle bar which is reversible and is adjustable up and down on the well-known triple front forks which have so long been a distinguishing characteristic of the Lyndhurst bicycles. Regarding this new bar, McKee & Harrington state that it is positive in action and rigid, and the steering power is applied

through it directly to the fork sides. Through it a wide range of adjustment and a well forward position of the hands without much curve of the tube are secured. As a bar in which stiffness and easy riding qualities are combined in the highest degree, this is claimed to be unsurpassed. The clamping mechanism is contained in the two short studs or braces that stand out at right angles from the fork sides, receiving the middle portion of the bar transversely, and is operated by a wrench applied to the nuts shown. Concerning the advantages arising from the use of the triple fork stem, the manufacturers say that the double crown enables them to lock the stem of the fork crown, so that the stress localizes at the top of the triple fork instead of at the lower end, insuring greater rigidity and power. The stresses caused by rough roads are carried in a direct line to the top of the crown, being distributed throughout the entire forks and frame. In turning corners or

under severe twisting strains caused by ruts, great lateral stiffness is presented in opposition, and the wheels are kept in better alignment. With the rectangular truss formed by the forside extensions and the fork crown, much of the side play present in all drawn tubing bicycles is overcome by reason of the stiffening of the head and fork sides.

## WHIRLWIND PUMPS.

Four styles of Whirlwind tire pumps are catalogued in a little folder that is being distributed by the Lockerby-Washburn Mfg. Co., 913 Nicollet avenue, Minneapolis, Minn. Three of these are foot pumps and the fourth has a 22-inch cylinder and a heavy metal base to be screwed to the floor. Most of the Whirlwind pumps are made of seamless steel tubing, nickel plated, with black enameled handle. The tops are not pressed. Another style of inflater catalogued is a combined pump and tool case designed to hang from the top tube of the bicycle frame by means of spring clips. The Lockerby-Washburn company also makes the Universal Swivel K and the Monitor Swivel pump connections, the latter of which was described and illustrated in the September 15 issue of Cycle Age. All these goods are guaranteed of good quality. No prices are quoted, but will be furnished on application. Electrotypes for use in jobbing catalogues are ready for distribution.

## U. S. CLYCLOMETERS AND PEDALS.

Herewith are shown two of the four models of pedals which the U. S. Mfg. Co., of Fond du Lac, Wis., is now putting in the

market for the first time. These are built the rear wheel can be readily removed without well tested principles and are guaranteed to be durable, serviceable, easy running and slightly. These two models differ in construction principally in width between ball races, the barrel and pin in the lower one being prolonged to meet the side plate at the end of the pedal, while the cone at the inner end of the pin is closer to the crank. The strength and attractive appearance are

apparent in the drawings. The U. S. Trip cyclometer registers the total mileage for the season and independently registers each trip. The figures are large and plain enough to be easily read from the saddle. Improvements in this instrument for '99 make it possible to set the single trip register back to zero without losing the fractions to the total. A new spoke stud has also been designed which will not move or turn on the spoke and damage the instrument or cause

THE CYCLE AGE

the loss of mileage. These cyclometers are made in sizes for from 20 to 30-inch wheels and are finished both in antique copper and polished nickel. Gold and silver plating are also furnished.

**WOLFF & CO.'S NEW MODELS.**

One of the handsomest lines for 1899 which has thus far been seen is that of R. H. Wolff & Company, Limited. The product of this concern has always been noted for its

Model 29—Racer; Price, \$75.

Model 30—Men's Roadster; Price, \$60.

Model 31—Women's Roadster; Price, \$60.

Men's Tandem—Price, \$100.

Combination Tandem—Price, \$100.

general excellence. Being one of the largest manufacturers of crucible steel and steel wire in America, the Wolff people are naturally past masters in the art of manipulating the article which forms a large part of their enormous product. Buyers of Wolff-American cycles not only have the satisfaction of knowing that they are getting goods built by a concern of more than a quarter of a century standing in the business world, and of the highest financial and commercial reputation, but they also have the added assurance that all that is best in steel, and the working of same, is embodied in their purchases. The Wolff-American is not and never can be a low priced wheel so long as its extreme high quality and excellent mechanical devices are retained. Price is subservient to quality, and quality with R. H.

Wolff & Company does not imply material alone, but workmen, methods employed, attention to detail, finish and equipment. The line is built to sell to that class of trade which wants the best at a moderate advance in the price of machines of inferior quality. Representative dealers handle them and continue the agency from year to year, which indicates that the line must be satisfactory. The many good features the Wolff-American line offers will be set forth in the 1899 catalogue, which will be ready December 1, and will be mailed on request. The finish of the racer is strikingly new and the handsomest finish ever applied to a bicycle. It is a fiery, translucent enamel of ruby tint, applied over nickel plate, and is called "salamander" by the Wolff people. It can also be procured on the road model at a slight additional cost.

**A FULL LINE OF PUMPS.**

The new '99 catalogue of the Heath-Quimby Co., of Minneapolis, Minn., has just been issued. It is a small affair, but it presents a most complete line of tire inflating apparatuses, including the new combination pump and tool case, here shown, which has room enough in one end to carry the necessary tools and tire repair articles, which do not have to be removed when the pump is in use; the Cachol parcel carrier, the Diamond cycle stand, the A. O. A. spring wire adjustable wall stand and the Little Giant repair stand recently described in this paper. The Heath-Quimby Co. also makes a specialty of doing punching and forming for others, from dies furnished or dies which the company will make to order. One of the latest productions of this concern is a dupli-

THE CYCLE AGE

cate bicycle check, one part of which is permanently attached to the bicycle while a smaller metal check bearing the same number is removed by the owner when he leaves his machine. Should anyone attempt to steal the bicycle others would notice at once that the duplicate check was missing.

**THE '99 MANSON CYCLES.**

The Mason Cycle Co., 153 West Jackson street, Chicago, has its new models for next season out. They include a line of 28-inch wheel machines at \$50 and a 30-inch wheel model, No. 33, at \$55. These are all of three crown frame design, of which the Manson company was the originator. A great reduction in the weight of the three-crown construction with eccentric hanger has been effected in Model 33, which weighs only 21½ pounds with racing equipment and 23½ pounds with heavy road fittings. The specifications are as follows: Main frame, 1⅛ seamless tubing; lower rear forks, 1-inch tapered to ¾-inch; upper rear stays, ¾-inch tapered to ⅝-inch; front forks, 1-inch tapered to ⅝-inch. The three fork principle is used with drop forged connections, octagon pattern. The front forks and upper and lower rear stays are octagon D tube instead of the half round. These forks are heavily nicked on copper. The wheel base is 44 inches, with a 2¼-inch drop to the hanger, which is eccentric, allowing a further drop to 3 or 3¼ inches as desired. The hubs are dust proof. Sunbeam spokes are used, 32 front and 36 rear, in one piece rock elm rims, first quality. An expander is used for locking the handle bar. The cranks and shaft are of the two-piece pattern with the left crank and shaft in one drop forged piece fastened to the right crank by a slotted tapered joint under the sprocket nut. To detach, unscrew the bolt through the arm of the sprocket into the lug on the right hand crank and a few turns of the crank will cause the entire hanger to come apart. The bearings can be cleaned and reassembled without disturbing the adjustment. The sprockets furnished are 24, 28 or 30 tooth front and 8, 9 or 10 tooth rear, fitted with a 3-16 Baldwin detachable chain. The front sprocket is of pretty design, consisting of eight diamonds arranged on the cantilever principle, and is struck from armor plate steel. Octagon shaped cranks are fitted. The bearings are contained in an eccentric sleeve, which never having been heated, holds the cups in a perfectly parallel position to each other. The eccentric sleeve can be removed intact from the bracket by simply loosening a screw. The cups and cones throughout are turned from tool steel—oil hardened, then ground and polished perfectly accurate. The bearings are 3-point contact; all fittings are flush and the head is one-piece, heavily reinforced. The tread is exactly 4¼ inches. Machines will be furnished in three heights of frames—namely,

21, 23 and 25 inches. Finish is highly polished nickel and violet enamel, which includes grips and rims, all striped.

**TRIBUNE MODELS FOR '99.**

Following are outline drawings of the seven single models which, together with a double diamond and combination tandem and a trip-

Model 40—Weight, 23½ lbs. Price, \$40.

Model 41—Price, \$40.

Model 42—Weight, 22½ lbs. Price, \$50.

Model 43—Price, \$50.

Model 44—Weight, 23½ lbs. Price, \$50.

Model 450—Weight, 19 lbs. Price, \$75.

Model 460—Weight, 21 lbs. Price \$75.

let model, comprise the full line of Tribune bicycles to be marketed this season by the Black Mfg. Co. of Erie, Pa. Specifications of these were published in Cycle Age for November 10. Models 44 and 460 are fitted with 30-inch wheels. The regular finish of the whole line is robin's egg blue, ornamented, with nickel trimmings. The combination tandem is convertible, having a re-

movable top bar in front. Height of frame is 24 inches, with 20½ inches in front when the bar is out.

#### CONSTRUCTION OF STEARNS BICYCLES.

In a previous issue of this paper the 1899 patterns of bicycles manufactured by E. C. Stearns & Company of Syracuse were described. It is worth noting that this company realizes the advantages of light-weight construction, as shown by the specified weight of only 21½ pounds for the leading standard pattern diamond frame, the Stearns Special. In the models which are \$10 cheaper, the weight is increased to 24 pounds, thus showing the only correct relations between price and weight that can be maintained when the durability of the various models shall be kept up to about the same standard. It is the removal of 2½ pounds of material which costs the money, if it is done in such a manner as not to impair strength and durability. The return for

the additional cost comes to the rider in the form of increased elegance of contours and that ever-present feeling of luxuriousness that is the charm and comfort of light-weight construction. That the principle of saving weight only when it can be done without encroaching on the proper limits of safety is carried out consistently, is shown by the weight of the Stearns Ladies' Special. This model weighs 23½ pounds, although the firm of course is perfectly well aware that lightness is quite as desirable in ladies' bicycles as in men's. It is simply a mechanical impossibility to make a drop frame of the required strength as light as a diamond frame, to say nothing of the weight of guards. This is the penalty that lady cyclists must pay for wearing skirts; or else they must renounce the safety that goes with a well-constructed bicycle. The Stearns Racer weighs only 20 pounds, and in this particular the firm is acceding to the almost universal demand of racing men for light weight, while conforming also to better founded ideas by effecting the saving in weight chiefly in the accessories and not in the frame in which none of the requisite rigidity has been sacrificed. Among new details of construction in Stearns models the firm in its pocket-size advance catalogue calls attention to those shown in the accompanying illustrations. The engravings used are of the same style as herewith shown, a style which has been almost monopolized by the Stearns company and which is especially well adapted to reach the understanding of the average rider. The first engraving shows the method of locking the crank axle bearings, a point on which many good companies have gone wrong in the past. The crank axle and crank axle cones are in one piece, the cones being turned up on the axle, the center of which is left just soft enough so that it will not

twist; the cones are deeply hardened and the ends of the axle over which the cranks fit have the temper drawn to a point where they will not break, yet will not twist. Each axle is tested at one hundred pounds. The ball cups screw into the crank hanger, and are held firmly in place by a binder bolt and nut which passes through a forged lug underneath the crank hanger on each side. In each ball cup is a small screw which may be taken out and the oil introduced directly to the balls through the screw hole; the screw is then replaced and entirely fills up the hole. Three-eighths-inch balls are used in all crank axle bearings. In the chains, which are all made in the company's own completely equipped chain plant, and of unusually attractive appearance and irreplaceable strength, the usual form of chain bolt and nut has been entirely discarded and in its place is used a square head bolt held rigidly in position by a most effective spring fastening device. In the new handle-bar grip a steel sleeve, outwardly flanged at its inner end to provide a

bearing for the inner end of the grip center, and inwardly flanged at its outer end to provide a bearing against the end of the handle-bar, slips over the end of the handle-bar. Encircling this sleeve is a shell of buckskin fiber firmly held in place by a steel cap at the outer end. This steel cap is fastened to the handlebar by an oval head machine screw which screws into a metallic plug pinned and brazed in the end of the

bar. The outer flange of the sleeve is notched, and this notch fits into a corresponding one in the end of the handlebar, thus effectually preventing the sleeve from turning on the bar. The device provides a perfectly firm grip without the use of cement to hold it in place. The parts are interchangeable and renewable. Anyone can take it off or put it on. When specially ordered the Stearns company fits the Morrow Automatic coaster and brake to its \$50 models at an extra cost of \$10.

#### THAMES NICKEL STEEL CHAINS.

Among the first to recognize the value of nickel steel in bicycle chains was the Thames Chain & Stamping Company of Norwich, Conn., who in 1895 and 1896 made tests of this material with the result that they adopted it for their best chains in 1897. They make four styles of this unusually light and strong and highly finished nickel steel chain and four styles of case-hardened chains of standard quality and made with properly hardened blocks. Each style is made in different widths. In place of bolt and nut the company offers to equip any of its patterns with the special connection device which is shown in the accompanying illustration and which requires no tools to operate. This consists of a special rivet, headed on one end and grooved on the other, and a spring pivoted to one of the outside links of the connection link. The rivet is slipped in position like the ordinary bolt and having no thread is held in

place by the spring, which catches in the groove. To disconnect the chain, the spring, which is split at one end, is merely pressed apart, turned to one side and the rivet is withdrawn. The spring is the same shape as the outer link and is made of special steel tempered so that it cannot be bent out of shape or broken. The special roller block chain which is manufactured by this company is also shown in the illustration. It is made under Linnell's American and British patents, and has been tested at Cornell University, showing under a tension of 600 pounds an efficiency of 98.6 percent. It has also been used extensively during 1898, giving excellent satisfaction. It can be constructed more accurately than an ordinary block chain, and is stronger and will remain true to pitch longer, says the company. The center block is rigid, preventing side play, and keeping the rollers free to work. The principal friction comes on the rolls and rivets, both of which are hardened. It has found that the roller chain gives the best satisfaction when lubricated with machine oil. The oil should be allowed to remain on the rivets and the outside of the chain wiped clean.

#### THE RARITAN TIRE.

The New Brunswick Rubber Company has something new to offer every year. Its new tire for '99 is the "Raritan." A great demand has sprung up for a good, service-

able, guaranteed tire at a price which shall not seem too much out of proportion with the prevailing bicycle prices. When people paid \$125 for a machine they did not object to pay \$16 for a pair of tires. But people no

longer pay \$125 for their mounts; and tires, to appeal to prevailing ideas, had to come down somewhat in price. And yet, never before were riders so insistent upon good riding and wearing qualities, and so capable of detecting their absence. To meet this universal demand for a tire that should be first-class and yet entirely popular in price, the New Brunswick Company has introduced this year the "Raritan." In quality of rubber and fabric and in workmanship it is an excellent tire. It carries a guarantee that covers 60 days' use.

#### FRONT FORK END DEVICE.

The object of the Webb fork end reinforcing disk for which patents have recently been allowed is to permit the instant and easy removal of the front wheel from the forks of a bicycle without springing the fork sides over the ends of the axle. Not only does it accomplish this but it takes the place of the usual axle nut washer and acts as a reinforcement to the fork ends. While riders will greatly appreciate the facility

with which the front wheel may be removed and replaced, leaving the nuts on the axle, the manufacturers should be pleased to use so simple and inexpensive a device which strengthens the fork ends, prevents broken fork sides and springing out of true, which latter has been a common occurrence with the crude methods universally used heretofore. As shown by the illustrations, the Webb disk is a steel washer machined to fit the fork end and leaving a flange extending about half way around its outer circumference. The fork ends are punched with a slot and a small hole drilled or punched as shown. A projection at the upper end of the disk engages the small hole in the fork end. By loosening the axle nuts a few turns the projection on the disk is released from the fork side and the front wheel slips out, leaving the disks and axle nuts on the shaft. And the wheel can be replaced as quickly and as easily as it has been removed. The inventor, George S. Webb, of Aurora, Ill., has given an exclusive license to Modern Cycle Co., 313 First National Bank building, of Chicago, to manufacture and sell this device, and this company is now preparing to turn them out in large quantities for large and small bicycle manufacturers.

#### FEATURES OF NORMAN BICYCLES.

On the subject of weight of bicycles, which has been discussed to some extent of late, the Norman Wheel Co., 2120 West Susquehanna avenue, Philadelphia, Pa., makes some remarks explanatory of the apparently unnecessary heft of machines which are applicable to the whole trade. "It has been demonstrated," they say, "that one pound of bicycle will carry ten pounds of rider for all ordinary work and last for years, where the rider understands and appreciates the high class of material and mechanism in a really first class machine. But, as the finest machines are liable to the abuse of unmechanical or ignorant people, all bicycles must necessarily be made of considerable greater weight and strength than would be required if proper usage were insured, and hence while we are advocates of light weights our inclination to build even lighter than we now do, is checked by the lack of appreciation such delicate machines would generally receive." The Norman company has been engaged in manufacturing bicycles since 1892, and during these years has made only a special, high class of bicycles for retail trade. It owns its own factory and warehouse and has done a conservative but growing business. The New Norman is the only regular machine produced. The principal features of construction are: Flush joints, two-piece crank axle with invisible connections, 4¼-inch tread, cantilever sprocket wheels made perfectly flat and reversible, oval fork crown, and patent chain adjustment entirely covering the slot in rear fork ends. Seamless taper gauge tubing is used in the smallest and lightest machines, which are made up from 22 gauge tubing of 1 inch diameter for top tube, 1½-inch for bottom tube and seat mast, 1¾-inch head and 5/8-inch rear stays. The heavier machines are made of 22 gauge 1¼-inch tubing for the lower reach and seat mast, 1-1/8-inch for top tube, 1½-inch for head, and ¾-inch stays. The lower rear stays of all machines are made

MILWAUKEE, WIS.

Mention The Cycle Age

of flat oval tubing tapered toward the rear end. The hubs are of the company's own design, first introduced in '97. They are of the usual barrel pattern turned from bar steel, but are unusually short, causing only  $3\frac{1}{2}$  inches spread of rear and  $2\frac{3}{4}$  inches spread of front forks. This is made possible by placing all the cone ends, locking washers and nuts usually found outside of the flanges, inside of the hub, permitting the flanges to run extremely close to the forks. The flanges are left somewhat thicker than usual and bored radially to take straight tangent spokes. The bearings are disc adjusting, the cones being turned integral with a steel sleeve, which forms a rigid connection between them. The axle is removable without disturbing the adjustment, so that out interfering with the adjustment of the chain or any of the bearings. Up to '96 the company used the two-point bearing system; then, responding to the popular demand, changed to the three-point system. But after one season's experience with this type, the makers felt convinced of the superior running and wearing qualities of the former and reverted to the use of the two-point type. By having the front ends of the rear forks and the back end of the lower front bar of the frame join the crank hanger 1 inch below its center, the ends of these tubes apparently connect and form a cradle for suspending the crank hanger. By this construction, the drop in all frames is made to appear 1 inch greater than it actually is, so that an actual drop of  $2\frac{1}{2}$  or 3 inches appears to be  $3\frac{1}{2}$  or 4 inches in all, without further lowering the crank hanger or reducing the clearance between the pedals and the ground. The Watson Automatic seat post forms part of the regular equipment of the Norman line.

#### THE SMITH CO.'S LATEST DESIGNS.

In the accompanying illustration is shown the interesting construction of the crown, seat cluster and crank hanger fittings designed by C. J. Smith & Sons Co., of Milwaukee, especially for three-crown frames. These fittings are now being made in quan-

tity and the crown, which seems as well suited for any other as for three-crown design, is a remarkable specimen of sheet steel construction, being unusually light and strong where strength is required, besides providing for ample brazing surface and accurate fit in fork sides and fork stem.

#### HUDSON AND LENAWEЕ MODELS.

The Bean-Chamberlin Mfg. Co. of Hudson, Mich., has issued a second edition of its advance catalogue for 1899, describing five Hudson models, three Lenawee models and a new "competition killer" baptized The Noxall and designed especially for agents who carry the company's full line. The three crown frame design which the company was among the first to adopt is again used in the Hudson patterns for men and one of the patterns for women, and an improved internal expander of slightly appearance is employed for seat post fastening. For securing the handlebar stem the external clamp is considered preferable and is therefore used. Model 30 which is equipped with 30-inch wheels is the most expensive, commanding a retail price of \$60, from which top notch the scale runs down to \$40 for one of the Lenawees and a "competition price" for the Noxall. Flush joints are used in all the machines and the crank shaft mechanism in models 30, 40, 41, 28 and 29 is of the one-piece style made under Fauber patents but of the company's special design. The hubs are turned from the bar and provided with tool steel cups, ball retainers, dust caps and a special oiling device. The Sanger handlebar is specified for models 30, 40 and 41.

#### HAUBS' SELF-ACCOMMODATING STAND.

"A bicycle stand comprising in its construction a resilient base with a central raised wheel-rest, and resilient supporting standards at each end of the base provided

with wheel-retaining loops." This is the first of four claims allowed in the patent granted on October 18 to George C. Haubs of St. Louis, Mo., for the stand shown in the accompanying illustration. It is the principal characteristic of the stand that it will automatically accommodate itself to wheels of various sizes, such as 26, 28 or 30 inches, and will support them at three points against lateral movement. Ordinarily the receiver or trough is not depressed to the floor by the weight of the machine supported thereby, and therefore the only resistance to a sliding movement over the floor

is the slight friction of the rounded surfaces of the feet. This friction is in practice so slight that the machine may be easily moved about for exhibition purposes or for changing its location, the stand following the machine without turning up or over with the wheel resting therein. Having obtained his patent Mr. Haubs announces that he will prosecute infringers to the full extent of the law and will collect damage and royalty from those who manufactured the stand while his patent was pending.

#### ANDRAE'S NEW HUB.

F. T. Andrae, superintendent of the Andrae factory at Milwaukee, has perfected a new direct spoke hub, which will be used exclusively on the Andrae high grade roadsters and racers. The hub is said to possess a new feature which is an improvement on the ordinary direct spoke hub. It will be thoroughly covered by patents. John C. Schmidtbauer has returned from a two months' trip among the principal Andrae agents between Chicago and Boston. He reports that present indications point to 1899 as a very promising year for Andraes in the east. In the Andrae announcement published several weeks ago, the prices of the Andrae track and road racers were made to read \$75. This was a mistake, as these two models will list at \$60.

#### TRADE IN CLAU BAR GROWS.

The Claus Handle Bar Mfg. Co., Milwaukee, Wis., makers of the Claus Adjustable bar, has doubled its force of workmen and the plant is now running to the full capacity of the machinery. The company will endeavor to keep up with orders throughout the entire season, and, if necessary, will increase the capacity of the factory so that shipments can be made on receipt of order. The Claus bar is being received favorably wherever presented and will be used exclusively on several lines of high grade bicycles in '99.

#### TUGWELL CO.'S SCIENTIFIC HUB.

The Tugwell Manufacturing Company, 32 South Market street, Chicago, make the hub shown in the accompanying illustration, which has several well-considered features to recommend it. The cones revolve with the hub instead of the cups and as the circumference of the ball path on the cone is only one-third of the circumference of the

ball path on the cups this arrangement is believed among machinists to have the effect of reducing the distance of ball travel to one-third, thereby reducing the friction proportionately. The hub shell is turned from a solid bar and cups and cones are turned from tool steel and oil-tempered. The cones are ground after being placed in the hub to insure them running true with each other. Axles are made of best Bessemer steel with threads cut in lathe on centers so as to make the threads true with each other. A feature which is not plainly shown in the illustration is the reversible sprocket. Being slightly dished, the sprocket may by reversing it be made available for either  $1\frac{1}{2}$  or  $1\frac{3}{8}$  inch

chain line. This covers the principal widths of tread used on modern bicycles. The interesting claim is made for this hub that its construction, having the cone cavity turned outwardly, creates a tendency for dust to work out instead of in, thereby making the hub practically dust proof.

#### MATTHEW STRAUSS RETIRES.

The Strauss-Hanna Cycle Material Co., of Buffalo, has been succeeded by the Hanna Cycle Material Co., which will conduct the business the same in the future as in the past, at the same location, 120 East Genesee street. Matthew Strauss has retired from the business, having sold out his rights, titles and interests therein. The successors are now preparing their annual advance sheet of '99 fittings, and their annual bargain sheet, which will be mailed to customers within a few days. This will be shortly followed by the '99 illustrated catalogue.

#### SOLE MAKERS OF BAND REPAIR TOOL.

The Call repair tool mentioned among the Recent Patents in the last issue of Cycle Age is manufactured in the United States solely by the J. H. Burt Mfg. Co. of Springfield, Mass., which has already closed contracts for 1,000 gross, and states that the outlook for the tool is more than bright. Anyone using clasps or any device on the side of a similar tool for throwing off the bands will be considered an infringer of the patent. The Burt company also makes the Ridgway adjustable handle bar.

#### STATE AGENTS WANTED.

The American Trading Company, 100 William street, New York city, are desirous of appointing one good house in each state, except Illinois and Indiana, to handle their cycle specialties, hard cement and liquid gutta-percha. Both articles possess superior merit. The trade in Indiana will be supplied by H. T. Harsey & Co., of Indianapolis, and the trade in Illinois by Hibbard, Spencer, Bartlett & Co., of Chicago.

#### TRADE NOTES.

L. H. Porter, who has been cycle and good roads editor of the L. A. W. Bulletin, has severed his connection with that paper and is now open for engagement. He has been active in cycling matters from their inception in this country as agent, dealer, manufacturer, correspondent, editor and League worker, and is author of two successful books, "Cycling for Health and Pleasure," and "Wheels and Wheeling." He may be addressed at Newtonville, Mass.

The Peerless Mfg. Co. has arranged with Messrs. Geo. F. Kehew & Co., 129 Pearl street, Boston, to represent them in New England. Mr. Kehew has associated with him Mr. Clark. Both are well known to the trade and the new arrangement should be advantageous to all concerned. The store on Pearl street will be Peerless headquarters and the distributing point for the New England states.

The Olive Wheel Co., of Syracuse, N. Y., has just secured an order from Australia for 1,000 bicycles of '99 pattern, 200 of which will be delivered at once. The force in the plant will soon be increased to 250 workmen, and the company reports a decidedly encouraging outlook for a successful season.

Fred J. Titus, who won many pursuit races and lowered a number of unpaired records with the Ramsey swinging pedals, has gone on the road to represent them to the trade for a five weeks' trip, after which he will go to Europe to further the interests of the Ramsey Swinging Pedal Co. abroad.

The I. W. Bollinger Co., of Chicago, iron and steel factors and manufacturers' agents, announce that after December 1 it will have offices in the Monadnock building, Jackson and Dearborn streets, where it will be more centrally located and easier of access to the trade.

A. R. MacDonald, formerly with the Wood Mfg. Co., will soon start on the road for the E. G. Eager Co., placing sundries and Elfin and Viking juvenile bicycles. The Eager company recently purchased the sole right to handle "Salamander," W. T. Nettleton's chain lubricant.

George B. Colton, of the Colton Cycle Company, recently secured an order for 2,000 machines from one Chicago dealer for early delivery.

American Cycle Company, now of Akron, O., has opened a Chicago Office at room 605, 56 Fifth avenue in charge of John B. Perrine.

# THE PASTIME AND SPORT

### An Anti-Potter Ticket.

Philadelphia, Nov. 28.—An important meeting was held here yesterday to lay pipes for the next presidential battle. Elliott, Keenan, Gideon and other Pennsylvania managers were present. As a result of the conclave the probabilities now are: Keenan for president, a Massachusetts and a western man to get the vice-presidencies, New Jersey the treasurership, and the west the racing board chairmanship. The feeling is general that Potter, realizing that his chances are small, will also swing into line. Elliott

while Lamberjack ran third in the latter and second by inches to Wachkewitch in the three-vestas scratch event. Lamberjack and Meyers won the 1½-vestas tandem heats against time and also won the 4½-vestas pursuit race.

### Electric Tandem of American Make.

John Lawson, the "Terrible Swede," claims to have perfected an electric tandem capable of running forty miles an hour. The machine is an ordinary triplet equipped with thirty-six batteries and a motor of one and one-half-horse power,

### Will Be a Memorable Winter.

New York City, Nov. 28.—Etienne Stephane, the veteran French plugger, and Ulysses Monachon, the Swiss rider, arrived by the St. Paul last Saturday to compete in the six-day race, which begins at Madison Square Garden next Sunday night. These will complete the foreign brigade, whose other members are Frederick, the Swiss; Joyeux, the Parisian; Cistac, the Australian, and Hale, the Irishman. The entire outfit, with Edouard Taylore and Fournier and Ricard, the French petroleum tandem pacing team,

and Gideon assert that Keenan will have the solid support of the Massachusetts and Pennsylvania delegations at Providence. New Jersey will probably support that ticket which elevates the man of her choice, Kireker, to the highest position. A combined west, with Massachusetts and Pennsylvania, could, however, beat a New York ticket supported by New Jersey and the New England states.

### Lamberjack and Meyers in Russia.

A big race meet was held in Moscow, Russia, November 13 and 15. Lamberjack of France and Meyers of Germany competed with the Russians, Meyers winning the two-vestas scratch race by three lengths and running second to Wachkewitch in the 1,000-meters scratch race,

weighing in all twenty pounds. The new machine has been tried on the Chicago boulevards with success. Lawson asserts it will run at the rate of forty miles an hour for three hours without recharging.

### An Index to Development.

As speed is recognized as an index of the quality of a bicycle, a comparison of the latest track records with those of 1884 may serve to show at a glance the rapid development of the machine. The times of fourteen years ago were of course made on the "ordinary"

left Saturday night for a week's practice at the twelve-lap indoor track at Troy, built by Harry Elkes' father. These races will open an indoor racing season which promises to be memorable. Most of the crackajacks with the exception of Bald will be on hand, and there will be amateur and professional championships at one mile. Elkes and Taylore are to meet in an hour paced race, and Tom and Nat Butler and Watson Coleman, who have been taken from the blacklist by a mail vote of the A. R. C. U., under whose sanction the races will be run, will also compete and formally join the outlaws. A feature of the winter's racing will be middle distance matches with motor pacing.

**BICYCLES NOT BAGGAGE**

**English Court Decides Test Case Between Railroad and Cyclist—An Interesting Decision.**

A decision has just been handed down by a London judge in the first test case that has been brought in England to determine whether or not bicycles are personal baggage and whether or not railroads can be compelled to carry them free as such according to act of parliament. The plaintiff sought to recover the sum charged by the company for the transportation of a bicycle, which it declared was extra baggage. The counsel for the plaintiff contended that the wheel was clearly personal, as it was something which the traveler carried for his own personal convenience and use. There was no distinction, it was argued, between a bicycle and a gun-case, a case of fishing-tackle, an artist's easel or a pair of roller skates.

The railway company argued that a bicycle was not an article which a person ordinarily took about with him. If a bicycle were to be regarded as personal baggage, it was urged, then a boat forty feet long would have to be so regarded and carried free. The court held that a bicycle was not personal or ordinary baggage, and that the railway company was entitled to make charge for its carriage.

**Cycle Racing Craze in Berlin.**

Admittance to the recent grand prize meets in Berlin cost more than the choic-

est places in the opera house and boxes were auctioned off as high as \$5 a seat. On one of the days about \$15,000 was taken in, and altogether the owners of the race track are said to have made about \$50,000 thus far this season. The "prize of Berlin" (\$4,500) was raised by voluntary subscriptions among the lovers of the sport in the city.

**WILL MEET TO ORGANIZE**

**Call is Issued to Track Owners, Clubs and Racing Men—Plan of Government.**

New York City, Nov. 28.—Formal steps to organize a new body to control bicycle racing in this country, to be known probably as the National Cycling Association, and to be composed of track associations, amateur race-promoting clubs and the professional riders, will be taken in this city next week at a meeting to be held next Thursday morning. The reasons for the formation of such an association are set forth in a call to be promulgated this week, which is in part as follows:

Dear Sir:—For reasons hereinafter set forth, it is desired that your track association or club, whichever the case may be, send a representative to a meeting of track associations, race-promoting clubs and professional riders (the latter represented by duly accredited delegates from the American Racing Cyclists' Union), to be held Thursday, December 8, at 10:30 a. m., at the Fifth Avenue hotel, New York city.

The object of the meeting is for the purpose of considering the advisability of taking preliminary steps toward the formation of a body to assume control of cycle racing in the states east of the Mississippi river with the exception of Louisiana, such body to direct the sport as soon as organized or at such time as may be decided upon at the meeting. The signers of this call believe that the

time has come when the associations which have invested in tracks, the clubs which risk their money in promoting meets, and the professional riders who earn their livelihood in competition, should have something to say in the government of a sport in which they are all so vitally interested.

Necessity for a meeting of these interests is urgent for several reasons, and the future demands immediate action of some sort.

In the L. A. W., the anti-racing element, as represented by such leaders as Chief Consul Sterling Elliott, of Massachusetts; Chief Consul-elect Milo M. Belding, Jr., of New York; Secretary-Treasurer P. S. Collins, of Pennsylvania; Chief Consul M. C. Rotier, of Wisconsin, and many other prominent members, is becoming so strong that the likelihood of the League's abandoning the sport is more than a probability.

The stand taken by the professionals, the attitude now apparent in the L. A. W. outside of those who are obtaining pecuniary advantages by the government of racing, and the fact that with the exception of the eastern states the sport in all other parts of the country has passed beyond League control, only illustrates the imperative need for a new body to be in readiness for any emergency.

Copies of this letter have been sent to all track owners and race-promoting clubs in the states east of the Mississippi with the exception of Louisiana.

Will you please signify your intention to attend this meeting by notifying J. D. Lasley, Washington, D. C., or will you kindly notify him at once as to whether you are in sympathy with and willing to join in forming this new organization.

J. D. LASLEY,  
For Park Bicycle Track, Washington, D. C.  
JOHN C. WETMORE,  
Chairman Race Committee, Quill Club  
Wheemen of America.  
E. C. BALD,  
President American Racing Cyclists' Union.

The constitution and by-laws to be submitted for discussion, amendment, and adoption declare the objects of the association to be:

This Association shall have for its object the direction of bicycle racing; the prevention, detection and punishment of frauds

**THE WORLD'S BEST RECORDS TO DATE AS ACCEPTED IN FRANCE**

The following is a list of the world's records for 1898, as recognized by the Union Velocipedique de France. Nearly all the figures which appeared on the list published last year at the same time have been altered. In a general way the times of all the performances accomplished on what one may call the classic distances have been lowered, that it to say, as far as the 200-kilometer mark. From that point up to the 1,000 kilometers, or say from four to twenty-four hours, the times remain unchanged.

One of the most remarkable features in the record hunt this year has been the keen competition against England by both France and the United States. Last season, thanks to the famous Crystal Palace teams, England held the majority of records. This year, the enormous progress made by the Americans in their pacing methods, and the rapid development of mechanical pacing in France have resulted in England losing the greater part of her supremacy. Another detail worth noticing is the more general

use of wind shields, which have allowed Huret to accomplish some really wonderful performances.

To satisfy all, the list includes records accomplished with and without the now famous shields, as some people are of the opinion that records established with the help of these instruments should not be allowed. The majority, however, reason that the shield offers but little more shelter than that afforded by the man on the rear of those triplets and quads where he is seated directly over the rear wheel.

# STEARNS BICYCLES

Yellow, as the predominant color of a wheel, has to-day a sharp, distinct and attractive meaning to the whole bicycle world.

A wheel may be enameled in any color without increasing its efficiency; but in the process of selection the eye and judgment are powerfully influenced by the appeal made to the imagination through the senses.

This element—weakness, if you will—in human nature, is keenly touched by color; by red, or blue—or yellow.

It is thus obvious that one may come to rate excellence, or its absence, by colors; turning instinctively from some productions that are bad in spite of tint or blazonry, and with equal eagerness seeking others that are immediately known to be perfect, simply, for example, because they are yellow.

All yellow bicycles are either Stearns bicycles or imitations.

The trade on the Pacific Coast supplied from our branch store, E. C. Stearns & Co., 210 McAllister Street, San Francisco.

**E. C. Stearns & Company,**  
Syracuse, N. Y.

The trade in the Dominion of Canada supplied from our Canadian factory, E. C. Stearns & Co., 67 Adelaide St. West, Toronto, Ontario.

therein; uniformity in the government of the sport, method of conducting race meets, and all other interests which would mutually benefit this Association, the racing men, and the public.

The association will control racing in the states east of the Mississippi and will form alliances with the Southern Cycling Association, the Western Cycling Association and the California Associated Cycling Clubs. The territory will be divided into five districts, practically as follows: A to consist of New England, B of New York and New Jersey, C of the other Middle States, D of the South, and E of the West.

The fees for active membership will be, \$100 for track and \$50 for clubs, and for associate membership, \$25 for tracks and \$10 for clubs. The A. R. C. U. will pay no fee, but will have a voting representative for each district.

Each district will have a district board and its chairman will be a member of the board of control. The chairman of this board and the district chairmen will be elected at the annual meeting of the association and each district chairman will name his own four associates. Handicappers will be appointed by the district boards. The A. R. C. U. will also have one member in the national board and one on each district board.

The powers of the board of control are set forth as follows:

The board of control will have power at all times when the Association is not in session to make such rules for the government of the sport as it may consider necessary; but it cannot involve the members of the association in the expenditure of money. Whenever necessity arises the national chairman is empowered to inflict punishment and act upon direct evidence for infractions of the racing rules; he can also, at his discretion, if he believes that there is injustice and illegality in any penalty imposed by members or officials at race meets, reverse such decisions. At his discretion the chairman may

call special meetings of the board of control to consider matters affecting members, either in their relations to each other, or in connection with the racing men.

A board of appeals is provided for as follows:

At the regular meetings of this Association, three members from each district, to be elected for such purpose by each district board, shall constitute the board of appeals. The proceedings of this board shall be limited to hearing appeals of racing men who desire opportunity to adduce evidence showing error in the decisions or rulings of officials of a race upon any track within the jurisdiction of this Association. This board may reverse the decisions or rulings of the officials of any race, providing error is proven.

Tracks not members of the association will have to pay a fee of ten dollars for holding a race meet under the rules of the association and riders competing at meets not recognized by the association will be subject to suspension.

Professionals and trainers will pay a registry of two dollars, and amateurs one dollar.

## CLOSING MEET IN PARIS

Protin Wins Match from Linton—Jacquelin Rides in Tricycle Race—Southern Circuit Formed.

Paris, Nov. 18.—The French racing season of '98 can now be said to be at an end, and all the leading velodromes are closed, including those of the Parc des Princes and the Seine, both situated at the gates of Paris.

A sort of winter circuit on the American plan is being organized and will include several prominent racing men, Banker and Grogna representing the foreign talent. It is the intention of the team to visit the south of France, Algeria, Italy and several cities in Spain. Each man is to pay his own expenses and to have the right of leaving the circuit at

any moment should he feel inclined to do so.

A race meet was given at the Parc des Princes on November 14 by the Syndicate of Riders for their own benefit, among the prominent riders present being Jacquelin, Protin, Linton, Bourotte, Courbe, Deschamps, and Gougoltz. The 1,333 1-3 meters scratch race was won by Courbe in 2:25, with Brecy second and Contenet third. A scratch tricycle race at the same distance was won easily by Jacquelin, from Courbe, second, and Loste, third, in 3:30 2-5, Courbe and Loste riding heavy road machines. Protin and Tom Linton rode a series of match races, man paced. The first heat of 1,000 meters went to Protin by twenty yards; in the second at 5,000 meters Protin lost his pace twice and was passed by Linton riding like a demon, who won in 5:53 3-5. The last heat at 1,000 meters was won by Protin, 30 meters to the good, in 2:30 3-5, the Englishman's pacing quad having let the opposing team steal 50 meters before it got into full action. Deschamps and Louvet were the victors in a 2,000 meter tandem scratch event, with Fossier brothers second and Carman and Boulay third. Time, 3:03 3-5.

## Paquin Breaks Waller's Road Record.

"Chic" Paquin, of Fall River, Mass., broke the 200-mile Norwood course record, held by Frank Waller at 13:04:47, on November 23, covering the distance in 12:55:00. His time is claimed as the American record, but in August of '95, A. W. Evans rode 200 miles at New Brunswick on a standard course in 12:20:00. Paquin's time, however, is state record. He rode a Columbia bevel-gear chainless, and the conditions were unfavorable.

**NEWS IN BRIEF.**

Tom Butler, whom Chairman Mott declares to be the L. A. W. Champion, has entered for the indoor races in New York. This must be a severe blow to "Uncle Jerry," who, quite contrary to the racing rules, sanctioned the payment of expenses to Butler, Coleman and Dreher to the New Haven meet to ride for much less than a \$150 first prize in the increased points championship race.

E. A. McDuffee has just had a difficult surgical operation performed on his nose in Atlanta, Ga., and will not be able to ride again until all danger of a hemorrhage is passed. The trouble had been a menace to his riding for some time. It entirely stopped up the nasal organs and forced him to breathe through his mouth when struggling hard.

Chicago wheelmen representing the Associated Cycling clubs, League of American Wheelmen, Northwest Cycling Association, Cook County Cyclists' Association and Chicago consulate are making preparations for an onslaught on the state legislature in behalf of the bicycle baggage bill and the good roads bill.

Chairman Hibberd B. Worrall, of the State Highway Improvement committee of the Pennsylvania division, is working vigorously on the bill to be introduced at the next session of the state legislature, asking for an appropriation to make the Hamilton good roads bill (passed the last session) operative.

The annual election of the Pennsylvania division of the League has resulted in the return of Chief Consul Boyle, Philadelphia; Vice Consul Thomas J. Keenan, Jr., of Pittsburg, and Secretary-Treasurer P. S. Collins, of Philadelphia, to their several positions.

The executive board of the L. A. W. has passed a resolution calling for a mail vote by the members of the National assembly, as fast as elected, to decide where the National meet shall be held in '99, invitations having been received from Boston and Buffalo.

Frank Starbuck, who is now at Lewisburg, Pa., has announced his intention of going to Australia within a month. He thinks his ability as a pace follower may enable him to defeat any of the native flyers against whom he may be matched.

W. F. Sager and Charles Hadfield, who did yeoman service in Major Taylor's pacing artillery, have issued a sweeping challenge to ride any tandem team in the country, any style race, any distance and for any amount of money as a side bet.

Al Weinig is busily engaged in arranging for the construction of a coliseum in Buffalo which is to be entirely covered. It is hoped by the projectors that this will become the winter quarters of the indoor racing men until next spring.

The election of the Indiana division L. A. W. resulted in the selection of the following officers for the ensuing year: Chief consul, Wallace Sherwood; vice-consul, Walter B. Hassen; secretary-treasurer, James A. Allison.

Henry E. Ducker, manager of Charles River Park track, has plans under way for the building of an indoor track in Boston this winter.

J. E. Wing, of San Francisco, established a new hour paced Pacific coast record No-

vember 20, covering 28 miles 1,089 yards as against 25 miles 978 yards made by Mussey, of Los Angeles.

Tom Cooper was planning to take a rest this winter, but the attractions of Madison Square Garden have proved too great and he is now preparing to enter indoor races for the first time.

## AND TRADE REVIEW

VOL. XXII—No. 6.

CHICAGO, DECEMBER 8, 1898

NEW SERIES No. 55.

### RIVAL SHOWMEN IN NEW YORK LOCAL EXHIBITION IN MARCH

Dealers are Said to be Opposed to the Holding of a Trade Show in January.

New York City, Dec. 5.—There is another showman in the field. He is bidding for the favor of the dealers in this city. Of course, he is ambitious to stimulate the trade, which with regret he has seen decline till it appears to utterly lack vitality. The extent of his solicitude for the welfare of the dealers is expressed in the following valuation put upon the spaces for rent:

19 spaces at \$30 .....	\$ 570
28 spaces at 40 .....	1,120
26 spaces at 50 .....	1,300
5 spaces at 60 .....	300
26 spaces at 75 .....	1,950
12 spaces at 100 .....	1,200
2 spaces at 150 .....	300
15 spaces at 200 .....	3,000
2 spaces at 250 .....	500

Total .....\$10,240

Dealers Opposed to January Show.

The exhibition will be held from March 23 to April 1 in the Grand Central Palace—the theater of the last national show held in this city. In announcing the enterprise, the following circular was sent to the trade:

After a thorough canvass of the trade it has been determined to hold a local cycle show at the Grand Central Palace building during the latter part of March, 1899. More than 60 per cent of our replies to inquiries favored the idea, and a large majority favored this date.

The arguments advanced by most of our correspondents was that it is already too late to hold a trade show—i. e., one to reach the jobbers, and that a show properly conducted late in the spring should be of intense interest to the public.

This is our plan, and no effort or expense will be spared to make the show worthy of the second city in the world. We are assured in advance of the hearty support of every daily paper in this city, and there is no reason why the result should not be satisfactory to every one concerned, both in re-awakening the interest of old riders and in creating new riders.

The prices made for space are less than half what they have been at any previous cycle show in this city. These prices include platforms and railings.

The price of extra electric lighting will be one-third less than the rates charged at the last show in this building.

Parlors will be set apart without charge for the meetings of any organization in the cycle trade.

B. E. GREENE,  
Secretary.

Note the argument said to have been advanced by the local dealers—that it is already too late to hold a trade show.

### Trade Flourishing on the Coast.

The past season has been the most profitable by far that any of the local dealers have ever experienced, notwithstanding the disastrous drought that has caused the loss of thousands of dollars to

the farmers throughout California. From present indications the bicycle business of 1899 promises to be all that could possibly be desired, so far as the Pacific coast is concerned. With the early rains that are now promised, abundant crops are assured for the coming year, and with the country once more in a flourishing condition, the trade for '99 should nearly double that of 1898. Many of the California houses have already received new models and have begun active preparations for the coming season.

### Bell Makers Organize.

The bicycle bell makers have formed an association for the purpose of preventing the sale of their goods below cost. For some time past bells of the cheaper grades have been sold at very low prices. It was to remedy this state of affairs that the association, which in no manner resembles a trust or seeks to establish monopoly prices, was established. A minimum price at which cheap bells will be sold has been agreed upon—from 10 to 15 cents a dozen according to the size and style, having been added to the prices now prevailing. Competition is and has been strongest on these goods. The price of the better grades of bells will not be affected.

### Frost Plant For Sale at Auction.

Under order of the court, Receiver Clarence K. Davis is offering for sale the assets of the Frost Gear Case company of Indianapolis, Ind., consisting of manufactured cases, stock and materials, office furniture, machinery, tools and fixtures. It is a well equipped plant for the manufacture of gear cases, and much of the machinery, tools and fixtures can be used in a stamping business. Until December 8 sealed proposals for the whole or any part of the property will be received.

### Public Barred In Germany.

The public was not admitted to the recent large cycle exhibition held in Leipzig. The show was exclusively a trade affair, intended to bring manufacturers and dealers together, and in this it was successful, more business having been transacted and important contracts closed than at any previous show.

### TRADE PROSPECTS IN CUBA AMERICAN ENTERPRISE NEEDED

Natives of Havana Show Interest in Cycling but Prices are High—Streets Well Paved.

Havana, Nov. 22.—The streets of this city are all paved with granite, and bicycle riding is very good—better, perhaps, than on many of the streets in the States. There is but one good road leading out of Havana. It is a fine pike for about fifteen miles, traversing a beautiful country.

The number of bicycles in use, however, can almost be counted on the fingers of the two hands, most of them being machines brought to the country by Americans; the others are of the old, solid-tire pattern of the vintage of 1890.

### Cycles Indifferently Handled.

There are a number of bicycle dealers in the city, most of whom handle English machines and carry American-made bicycles of doubtful origin. It is reported that several first-class lines are handled, but a patient search failed to discover them. The great trouble with the Spanish bicycle dealer is that, as with dealers in all other lines, it never occurs to him to advertise his wares, and he sits down in his house and waits for customers; and when his customers do come, he charges \$75 to \$100 in gold for machines sold in the States for from \$25 to \$40. In one store in Calla Obispo, the principal retail thoroughfare, the show window contained an old-style, solid-tire machine which had the appearance of having been sandpapered and varnished over the enamel, placarded at "\$37.50 Oro" (gold)—such a bicycle as the boys of the States would dub an "ice wagon." In many cases the dealer has relegated his stock to the rear of his store, and you would never guess that he had any unless you asked for them.

When asked regarding the high prices charged for bicycles, a native explained that the Spanish merchant never expected to get the prices at which his goods were marked and he always marked them up about 50 per cent in order that he might be able to come down.

### Low Priced Machines Would Sell.

There is no doubt that the natives are interested in cycling. This is evidenced by the fact that it was a daily occurrence for a young man who owned an old, solid-tired machine to bring it out on the Prado and perform a few simple tricks in riding in the evening, when he was sure to have from 100 to 500 spectators of all ages, who seemed to enjoy and applaud the young man as if he had accomplished something wonderful. Another

evidence of interest is that the bicycle thief has begun business. A young man left his machine on the sidewalk while he went into a store to make a purchase, and when he returned in about ten minutes his bicycle had disappeared, and he has not found it.

Cuba will take to the bicycle, because the interest is already here, and it will only need a few American dealers to launch the business with American energy, and with the expectation of spending a few dollars in judicious advertising, selling good machines at a fair profit, to ensure a fair trade at good returns.

Bicycles to sell at from \$35 to \$50 should find a ready market. It may take a whole season to introduce them, but in the end it is sure to pay. There are very many young men who are compelled to go errands about the city and who must now walk or pay 20 cents for a ride in a carriage. There is only one street car line, and that runs on but one street and out in the suburbs.

### THRIVING ON SIDELINES

**Christmas Toys and Roller Skates Help New England Dealers—Chainless Prospects Bright.**

Springfield, Mass., Dec. 3.—Main street dealers are doing a rushing business in sidelines. One house has laid in a large stock of Christmas toys, and another is exhibiting a phonograph and pushing the sale of winter sporting goods. There is a marked difference in appearance between the stores which carry sidelines and those which do not, and the more attractive appearance of the former at this season of the year undoubtedly has its effect on the summer trade in bicycles and sundries.

The chainless is being exhaustively discussed by the trade and riders generally. The reduction in the price has made many converts and a brisk trade seems assured in this style of wheel at the outset of the season.

The introduction of roller polo has caused a demand for roller skates and polo sticks. Two bicycle agencies carry these articles as sidelines. The game is having a big run in the Connecticut valley and a polo league has been formed by the large cities after the manner of the baseball leagues.

### One More Cycle Show.

The Detroit Wheelmen are going to give a cycle show and amateur photographic competitive exhibit, combined, at their club house during the week of December 12 to 17, and ask manufacturers to give some of the goods they make and in return they will allow reasonable wall space upon which to place an advertising card or banner, and will also distribute any cards, circulars, or small advertising matter in the shape of samples. The merchandise donated is to be disposed of for the benefit of the organization.

In addition they will place upon each article received a card calling attention to the goods and asking members to patronize you when in need of anything in the line.

### No Time to Visit at Shows.

Toledo, Dec. 5.—George H. Fisher, of the Gendron Wheel company, was asked if his concern would make an exhibit at the Chicago cycle show. "No sir, in big capital letters," he replied. "We're too busy getting out bicycles for bona fide customers to go around the country playing at bicycle shows and visiting."

Number plates must, by law, be affixed to cycles in France on and from May 1, 1899. They must bear both the name and address of the owner of the cycle.

## DEPARTMENT OF COMMERCE

### WILL PROMOTE EXPORT TRADE

**The Measure to Come Before Congress Provides for Jurisdiction Over Manufacturing and Commerce.**

Washington, Dec. 5.—One of the questions to be considered at the coming session of Congress is the proposed creation of a new executive department, to be known as the Department of Commerce and Industries. This subject commands attention now as never before, and the voice of the manufacturing and commercial interests of the country in support of the creation of this department will be heard stronger than ever. Our new territorial acquisitions emphasize the need for this new department, and the Frye bill to create such a department will undoubtedly have early consideration at the hands of Congress.

#### Functions of the Department.

Under the terms of this measure the proposed new department shall be at the seat of government, and there shall be a secretary of the same, who shall have a seat in the cabinet. This department shall have general jurisdiction over the foreign and internal commerce of the United States; it shall also have jurisdiction over all matters relating to the manufacturing interests of the United States, including the extension of foreign markets for the same, and the increase of trade and improvement of trade facilities with foreign countries. The bill also provides for the transfer of the several consular officers of the federal government, who are charged with the duty of facilitating and promoting the commerce of the United States with the countries to which they are accredited, from the jurisdiction of the State Department to the jurisdiction of the new department.

#### Special Investigations and Reports.

There is a provision to the effect that the secretary of the proposed department shall annually make a report to Congress, which shall contain an account of all acts done by him in promoting and facilitating the development of American commerce and manufactures, and such recommendations as he shall deem necessary to the further extension of our foreign and domestic trade. He is also charged with the duty of making special investigations and reports on particular subjects whenever required so to do by the President or by either house of Congress, or whenever in his judgment such special investigations and reports shall be required.

Probably few industries in the country are more interested in the extension of our foreign trade than the bicycle industry, and manufacturers will quickly recognize the need of urging the creation of this new department, whose chief function will be the promotion of our foreign trade.

### "Junk Dealer's" Appeal Filed.

Washington, Dec. 2.—An appeal from the decision of the lower court in the case of J. D. Lasley, who was recently convicted on the charge of being an unlicensed second-hand dealer, was filed in the Court of Appeals during the week and an endeavor will be made by counsel to secure an early decision in the case. A new phase of the situation has lately developed. It is held by the authorities that goods which have become shop-worn are second-hand goods within the meaning of the law of March 3, 1891, and that any dealer who sells such goods is liable to the tax. The fact has also been brought to light that any article left with a dealer

to be repaired cannot be sold by that dealer, if the owner fails to call for it, unless said dealer takes out a license. That the business men of the national capital are alive to the apparent injustice of this law is evidenced by the fact that the Business Men's Association, one of the leading organizations of this city, has tendered the services of its general counsel to the merchants who are affected by the law. Merchants in many lines of trade have given their active aid in an endeavor to defeat the law, and there is promise of a great legal battle when the case is called for final decision.

### LATE DATE SELECTED

**Philadelphia Chooses End of February for Local Exhibition—Talking Machines as Sideline.**

Philadelphia, Dec. 5.—The local cycle board of trade has again selected the Second Regiment armory, after a careful canvass of available buildings, as the best suited for its annual cycle exhibition, and has decided that the best time to hold the show will be the week of February 18-25, just before the retail buying season opens.

The managers are enthusiastic over the outlook, as up to last Saturday telegraphic and mail applications for space from out-of-town concerns far outnumbered the actual number of such exhibitors at last year's show, which the National Board of Trade refused to sanction. Included in the applications already received are quite a number from manufacturers of motor vehicles, which will be one of the leading features of the coming exhibition. The chainless bicycles will of course attract much attention.

The sentiment among local agents and dealers as to the advisability of or the necessity for a show seems to be equally divided, but all the principal machines will be represented—some, it is true, on the plea that "we'll have to go in if the others do."

Almost every local dealer has added some sideline to his business, but even these do not seem to be able to overcome the adverse combination of bad weather and the pre-holiday slackening of trade. It is surprising to note the number of stores on the "Row" which have selected phonographs, graphophones and kindred instruments to keep trade active through the winter. Those who have chosen them are decidedly hopeful. Some of the stores carry both incandescent lamps and graphophones, keeping at the same time a large selection of "records" for the latter. Business in new selections can always be depended upon after a sale of an instrument, for there is a natural desire in the purchaser to increase his collection of interesting selections of vocal and instrumental music as well as of recitations and famous speeches.

Among the announced changes in the local trade is the abandonment by the Union Cycle Mfg. Co. of its branch at 814 Arch street, and the placing of the Philadelphia agency for the sale of its output with Michael J. Costa, who is at present handling the machines of the Relay Bicycle Mfg. Co., of Reading, Pa., at 1003 Arch street.

Another important change is the placing of the local Stetarns agency, hitherto held successively by Wiese & Bowen and Hill & Lyster (both of which have gone out of business), with Roach & Barnes, 821 Arch street, who handle the output of the Indiana Bicycle company.

The bicycle tax of France yielded a revenue of \$812,160 during 1897. There were 408,869 bicycles in use, as against 203,026 in 1894, showing an increase of more than 100 per cent for the three years. There were 13,057 machines exempt from taxation.

**TUBE MAKERS ARE IN DESPAIR  
ENGLISH MARKET DEMORALIZED**

**In Two Years the Value of Investments  
has Shrank Over Eleven Millions  
of Dollars.**

The English tube trade is in a deplorable condition. Within the past two years the value of the investments in this branch of the bicycle industry has depreciated almost \$11,250,000. The amount invested by the British public in the various tube companies reaches \$13,750,000.

Its business—doubtless partly owing to the fact that the heavy capital required would keep small firms out of it—has been regarded as the most solid branch of the cycle and allied trades. But its high appreciation at one time is, doubtless, part of the reason of its phenomenal fall since. A large number of companies, some of them good, solid businesses at the time, were formed and floated. The high-sounding titles of some of them, compared with what they have accomplished since the boom, would be amusing if the gravity of the matter did not make it almost tragic.

**Cut-Throat Competition.**

During the period of inflation extra plant was laid down to such an extent that even the then phenomenal demand would have had to be doubled to employ the extra mills. Instead of which America, France, and Germany, by laying down their own mills ceased to buy tube from British makers, so that by the time the new mills were ready each company found the market restricted to scarcely more than half what it was previously, whilst the capacity of turnout was doubled. What is usual in all such cases followed: each company under-quoted the others in order to get business, and the price naturally tumbled down to the bare cost of production, leaving nothing for the poor shareholders, except the usual "deficiency to carry to reserve." In cases where a small profit has been shown on paper, and a dividend paid, it has weakened the company—in one case so as to produce failure within a few months of a 10 per cent dividend. This is, of course, exceptional; but the fact remains that, with weldless steel cycle-tube being sold at cost, companies who pay dividends do so at a considerable risk to their future position, and practically pay away a portion of their cash working capital, which is their life blood.

**An Association Proved Abortive.**

An association to regulate prices was attempted some time since, but through two or three firms refusing to join, it proved practically abortive. And so the investor who had shares in several companies was placed in the absurd position of having his securities warring with each other and cancelling themselves down to nothing, while he was forced to stand by and witness the wasteful process, which, by equation, meant self destruction of his property. The total result is that they all are reduced in value, and their profit-earning capacity is, for the time being, destroyed.

**No Hope is Left.**

The position has now been reached in which no profit is being made out of weldless steel cycle-tube at all, and it will naturally be forced forward to positive loss, in the hope that some of the firms may be crushed out of existence. Now, if this were readily done, some slight hope might be entertained that in two or three years' time the fittest only would survive, and that then the trade might be again profitable, if not to a great extent, still to some. But, unfortunately, even

this small hope cannot be justified, for these reasons:

(1) The demise of a company does not necessarily mean the destruction of its mill or splitting up of its plant.

(2) Many of the companies are wisely closing down, waiting for better times, which, by the very fact that others are doing the same, can never come, for the moment any profit is to be made, they will open up again, and down will come the price to losing level once more.

(3) This war of prices has been going on over a year, and although five small companies have been forced into liquidation, yet the plant of only one has been split up, and that company was the one which committed suicide by paying a dividend—several of these five practically never did any trade, and so their demise does not affect the market.

(4) There are still twenty-five weldless steel tube producing firms (and the plant of four others), and, with perhaps two or three exceptions, by shutting down when tube is sold at a positive loss, and paying no dividend, they can exist for many years to come.

From all this, it appears that the shareholders in cycle-tube companies have only a sentimental interest in their shares, and have no reasonable possibility of ever receiving any pecuniary return from them.

**GERMAN BANKS AND EXPORTS**

**Important Part Taken by Commercial Banks in Promoting Foreign Trade of the Fatherland.**

One of the most effective of German methods in the promotion of export trade is the direct indorsing of commercial paper on the part of the banks, so that these themselves form a component force in commercial activity.

The German commercial bank is in fact one of the chief cornerstones upon which the imposing structure of German commerce stands. The bank is very often the organizer of a syndicate of manufacturers or exporters, whose drafts it converts into cash. Especially is this the case in London. Then agencies are established and maintained the world over. A client of the bank receives, for example, a concession in China or a large order from some South American government. He then goes to a branch of the bank in the place, or instead of this to one of its agents, and is certain that his draft will be accepted, because the bank is a sharer in the undertaking. The growth and activity of German competition are very much accelerated through the facilities which Lombard street gives to German commercial paper. If Lombard street should November 1 refuse to cash German commercial paper of the kind under consideration, Germany's exports for that month would show such a decrease that the commercial world would be astonished.

**W. B. Mendenhall Deceased.**

Col. W. B. Mendenhall, president for thirty years past of the American Sewing Machine company and president of the American Traveller Bicycle company, died in Atlantic City November 27 of heart disease. He was seventy years old and lived in Philadelphia. His wife died in Atlantic City nine weeks ago. He was paymaster in the army from 1862 to 1866 with the title of lieutenant-colonel, and was stationed at Fort Leavenworth, Harrisburg, St. Louis and Washington. He was a member of the Union League, Philadelphia; Post 2, G. A. R., and the Loyal Legion. Three children survive him—Howard L. Mendenhall and Mrs. W. M. Baldwin of Philadelphia, and the Rev. H. G. Mendenhall of the First Presbyterian Church, Kansas City. Burial took place November 30 at Coatesville, Pa.

**SHY OF CHICAGO CYCLE SHOW  
MAKERS ONLY RESERVING SPACE**

**With but Seventy-Two Booths the Promoter is Advertising a "National" Exhibition.**

For reasons best known to themselves the manufacturers do not seem to be tumbling over each other in a mad effort to take space at the Chicago cycle show, which is billed to take place in a disused store building and is being impudently advertised as assuming the proportions of a national exhibition. Reservations of space are far more common than actual contracts, a fact which is deeply significant of the watchful mood of the makers and the suspicion they entertain that all is not so well with the promoter of the show as he so flamboyantly asserts. Tempering his greed to the shyness of the trade and public in supporting the exhibition Van Sicklen looks forward to fingering only about \$8,000, which puts him in a class of showmen which is content with crumbs because they lack encouragement to aspire to more fattening food.

**Only Seventy-Two Spaces.**

Here is Van's layout:

49 spaces at \$ 75.....	\$3,675
3 spaces at 90.....	270
20 spaces at 100.....	2,000
Total ..	\$5,945

It is bound to be a starved affair with only 72 spaces. Souvenir hunters will be welcomed with warmth. They will be needed in order to heighten the illusion that it is the goods on exhibition which attract attention. No official catalogue will be printed; it would cost too much money.

There will be no "hold-up" by construction companies, for Van has reformed.

**Space is Reserved, Not Taken.**

Following is a list of firms which have "reserved" spaces:

- H. A. Lozier & Co.
- Fanning Cycle Co.
- Sager Gear Co.
- Carlisle Cycle Works.
- Iven-Brandenburg Co.
- Oakman Motor Vehicle Co.
- Fowler Cycle Works.
- Naber Saddle Co.
- A. J. Gray.
- The Stockton Co.
- L. Rastetter & Son.
- Baldwin Chain Co.
- P. & F. Saddle Co.
- Peacock Chain Co.
- Mfrs. & Merchants' Warehouse Co.
- David Bradley Mfg. Co.
- Manson Cycle Co.
- F. S. Waters & Co.
- A. Featherstone & Co.
- Monarch Cycle Mfg. Co.
- W. H. Fauber.
- League Cycle Mfg. Co.
- Snell Cycle Fittings Co.
- Jenkins Cycle Co.
- Pope Mfg. Co.
- A. D. Meiselbach.
- Wheeler Saddle Co.
- American Tube Co.
- Peterson & Hastings.
- J. B. Thorsen.

**No Offer for Warwick Plant.**

Springfield, Mass., Dec. 5.—The opinion is expressed in trade circles that the factory of the Warwick Cycle Manufacturing company will be sold at auction. The assignees have been unsuccessful in disposing of the plant at what they consider an equitable figure and there seems to be no way of selling it other than under the hammer. The price of the plant has been held at \$100,000 by the assignees, but this amount will hardly be realized if it is sold at auction. It is said that several parties have refrained from making the assignees an offer, preferring to take their chances at a forced sale.

Many of the small makers and repairers in London are just now running fire-works as a side line.

### FOOLING THE MAKERS

There is that difference between a rose and a "national" cycle show that the latter would not smell half as sweet by any other name. So long as the broad American public were still aglow with enthusiasm over the newly-discovered fact that they could do something else than walk without paying fare, the means by which this wonderful thing was to be accomplished truly did attract "national" attention. That a lumbering mortal, who never in his life could as much as turn a handspring, by saving a few dollars could become a glorious athlete and beat the noble horse in speed, could get the best of a street-car company, could mock the rail-bound locomotive in a new combination of freedom and swiftness, and that this mortal, if a female, could vault with impunity over several of the irksome traditions of her sex and improve her physique in the bargain—was the cheerful message of a new physical religion, of which the public press became the willing apostle and its readers fervent proselytes or croaking doubters.

Whenever and wherever a bicycle was mentioned or shown, it appeared in those days to be wrapt in a mist of semi-emotional thoughts that gave dignity to the most trifling contentions connected with its construction, its speed, its design, its strength. The scrubbiest racing man who had the impudence to claim speed was looked upon as a minister of the rejuvenating new gospel, and a cycle show was like a revivalist meeting, where personal testimony to the fruitful blessings of the evangel was freely offered and discussed with the ardor of sectarians. Manufacturers were demigods, agents were priests, and so long as cycle finance remained an unknown domain, enthusiasm waxed fat on its own exuberance.

It was this train of sentiment which made "national" shows the centers of the cycle mission, and the press were obedient to the ordinary rules by which the value of "copy" is judged, when they spread before the public the minutiae of cycle exhibits as thoroughly as they would the testimony in a celebrated murder case.

Everybody knows how much there is left of the enthusiasm, and it is idle to locate the blame for its disappearance. The seed of cynicism in cycle affairs was sown by the New York Herald in 1895, and has grown so rank that nothing but the fundamental and intrinsic merit of cycles now keeps them before the public eye. There are no more demigods. The worst cynics on cycle trade are in it and of it. There are a few robed priests left among the agents, but they are away out in the country and do not come to "national" shows. If they did, they would become cynics like the rest. It is chiefly among the broad, good-natured public that one still finds a few who cherish the bicycle as they would a horse, and take pride in the peculiarities of their mount as soon as they have paid their money for it. To disturb these in the good work which they are quietly doing in their various localities by spreading disillusioned press reports of pretentious shows staged in a chilling atmosphere of doubt and indifference is one of the propositions advanced by show promoters who are anxious to draw the last drop from the cycle trade milch cow.

Like the shrewd fellows they are, they see well enough that a new drawing-plaster is required to attract the city crowd, and they boldly announce the motor-vehicle as such, trusting that the cycle trade will not perceive that cycles will be dwarfed in

the public estimation in proportion as motor-vehicles are made prominent.

They call their projected exhibitions "national" in the vain hope that this word, even though its meaning has departed, will revive the fructifying enthusiasm that once gave it significance. They are trying to make the cart pull the horse, and a good part of the trade is looking on to see if it can be done.

As at one of the table-dancing seances of old, the trade holds its trembling fingers obediently on the table's edge—incredulous, but anxious for the miracle; and lo! the table moves. The promoter laughs in his sleeve. The public laughs when it hears of it. Only the trade has been fooled.

### SHOW SPACE SHOULD BE FREE

Should exhibitors pay for space at cycle exhibitions? Let the answer be made after careful study of the following authentic record of the receipts and disbursements at the last show held in Madison Square Garden:

RECEIPTS.	
Box Office.....	\$24,574.50
Coat Room.....	248.70
Rentals.....	44,520.00
Trade Tickets.....	4 032.25

Madison Square Garden Co. 25 per cent of \$36,457.86.....	9,114.46
	\$36,457.86
RECAPITULATION.	
Madison Square Garden Co.....	\$ 5 000.00
Madison Square Garden Co.....	8,000.00
Madison Square Garden Co.....	9 114.46
Board of Trade.....	8,000.00
Board of Trade.....	27,343.40
	\$35,343.40
Net Profit.....	\$57,457.86

In the last issue of this paper it was remarked that the projected eastern show would likely net its promoter about \$70,000. In view of the above figures, it is necessary to amend this statement. Allowing for a shrinkage of about \$12,000 in space rentals, and assuming that the receipts from other sources will not be diminished, Mr. Sanger has in sight a profit of \$60,000.

### ENGLISH TRADE CONDITIONS

Investors in English cycle industrial stocks are sullen or exuberant, according as the annual reports of the various companies are shaded with expressions of disappointment or lightened with evidence of hard-earned success. There is no consolation for the losers—they gambled, or were bedeviled by the arch Hooley, and in either event paid the forfeit for gaming or indulging in licensed roguery. As the usual earning power of money is very low in fair Albion, it is doubtful

if the moderately successful operators feel any such keen sorrow at being cheated of their expectations as would be manifest in a people more accustomed to large rewards in commercial enterprise. The heavy winners are, as usual, not more envied by the class they distanced than they are hated by those they have spoiled.

These company reports are highly instructive. They disclose the precise causes of disaster and success, expose to view many a hidden skeleton, give expression to future policies, and, when compiled with care, present a tolerably accurate picture of the present state of the industry. They are not composite in character, but special. Here, for example, is the heart of a report of a large saddle-making house:

A report was presented showing a clear profit of £30,119, giving, with the £256 brought forward from last year £30,375. Out of this it was proposed to carry £15,000 to the reserve fund (which would then stand at £35,000), and to pay a dividend of 10 per cent per annum. The chairman pointed out that the profit for the year was £6,000 more than that for the year in which the company was inaugurated. The profit shown was all in actual cash, and they had some £5,000 in addition. The difference between the profits of the year just closed and those of the previous year was due to the extraordinary demand of 1896. In proof of the soundness of their trade, it was pointed out that on the very large turnover their debts amounted only to £250. The chairman stated that the reserve fund was invested outside the business. A director thereupon said that it would be better in a trading concern to have the reserve fund invested in the business where it would be making 10 per cent instead of the beggarly 3½ per cent they could get outside.

In the following report the calamitous history of a stamping concern is recited, and reconstruction is urged in order to avoid ruin:

The meeting was called to consider a scheme for the reconstruction of the company by the formation of two companies, one to carry on the stamping business, and the other to make a patent lift. It was proposed as part of the reconstruction scheme to offer to each holder of five shares in the old company one ordinary and one preference share of £1 each with 17s. paid up in the stamping company, and one share of £1 with 19s. paid up in the lifter company, the unpaid capital to be called up as occasion required. These calls would give a new working capital of £6,000 to the stamping company, which would pay all liabilities up to the present time, and £1,000 to the lifter company, which would start with assets only. The business was at the start primarily a stamping trade. During the boom in the cycle trade every stamp was fully employed at a good profit, but immediately the present company was floated the cycle trade dwindled down. The directors endeavored to extend their business beyond the cycle trade, and met with some success in that way. There were now unexecuted orders amounting to four or five thousand pounds, and the returns were nearly double what they were a short time ago. It was thought the stamping business should pay a good profit, if expenses were curtailed, and such savings could be made in that department as would suffice to pay the preference dividend, and a substantial dividend on the ordinary shares. The proposed new stamping company would have a capital of £40,000. It was decided to appoint an advisory committee to work with the directors in carrying out the scheme.

Loss of foreign trade forced the directors of a heavily capitalized cycle manufacturing house to make these pitiful disclosures:

Your directors regret that the year's trading has been, from a variety of causes, very unprofitable. The result is a loss on trading of £5,682, to which must be added certain exceptional charges for advertising and bad debts, and these, together with depreciations, managing director's remuneration, and debenture interest and bonus, make up the total loss to the heavy figure of £14,037. Against this can be set the amount brought forward from last year, £437, leaving a net loss to carry to the balance sheet of £13,600. Chief among the causes for this unsatisfactory state of affairs has been the complete collapse of the foreign trade. Some portion of this trade, however, your directors are sanguine of again securing. Again, the management and establishment expenses were arranged on the assumption that a large trade would be done, and the extended trade not having been secured, the existing expenses have told very heavily against a diminished turnover. During the last few months radical economies in the establishment and management expenses have been made, the benefit of which should do much to ensure a better result in the current year. In face of the figures shown, your directors have relinquished the whole of their fees for the year.

A firm of rim makers, in acknowledging the necessity for reducing prices, reported:

The chairman said the directors met the share-holders content with the past, and confident as to the future, notwithstanding the difficulties they had had to encounter by reason of competition, and the evil reputation of unsound cycle companies. They had more than held their own, but they had not been able to do this without some modification of prices. The price of tires had been reduced, and as the tire and rim were sold together, it was only reasonable that the rim should also be reduced. Their trading during the past year had been largely in excess of that of the previous twelve months, and the orders on the books were much more numerous than ever before. They had recently built works in Germany four times the size of the building in Birmingham, and they intended to extend their business into France and Belgium. As to the German works, they belonged to the present share-holders of the company, with the exception of a few shares which had been allotted to one or two German gentlemen who, it was expected, would bring native business.

Faulty construction, due to inexperience, cost the tire house making this report a pretty sum of money:

Coming to the question of the adverse balance upon the year of £19,606, the chairman said the reasons were the same as he gave last year, namely the difficulty of introducing a new article, and the extraordinary expenses which they had to incur in pushing the tire. As he told them last year, they found in the middle of that season a mistake had been made in the manufacture of the tires, and they had to call them all in, and he estimated that policy, which was absolutely necessary, was represented by £10,000 in the loss shown this year. As to the remaining £9,606, a large proportion of this was due to the expenses of travelers and advertising. Considering the conditions of the cycle trade this year, their business done was better than the previous year, and for each month since the end of January had steadily shown a profit. A director wondered who was responsible for making such a large number of faulty tires. The chairman replied that it was not so much bad work as want of experience, and the managing director was no more to blame than the whole of the board.

By the time the record is complete it will be discovered that the English cycle industry is in a much sounder state than one would have supposed after reading the fiction supplied by writers who studied only surface conditions and drew upon their imagination to conceal their deficiencies.

\* \* \* \* \*

The attention of agents is again directed to the slipshod manner in which country newspapers print advertisements. If the announcements are written with skill, they are almost certain to be composed in bad taste, inconsequential lines are unnecessarily accentuated in type, and their value is either lost or smothered. But it is in the handling of cuts that the papers and their customers give the greatest offense. There are but two kinds of cuts which are suitable for daily paper advertising. One is the outline form of work, which is neat and artistic in effect, and the other is the striking black and white work. If the former style of drawing is selected for use, it is essential that the fewest lines be employed. For example, the wheels of a bicycle need only the circles of tires and rims, and heavy dark frame lines passing through them. To sketch in the spokes is to mar the forcefulness of the picture and to invite the printer to clog the small openings with ink. Reference to the department of this paper entitled, "Information for Buyers," will frequently reveal model outline work. The solid black and white style of illustrating is so little practiced by daily paper advertisers that whenever it is employed it is certain to attract attention. It is not without its disadvantages, however, for imperfect inking often causes the cuts to assume a faded appearance. In outline drawings the frame lines should be heavy, while the saddle, handlebar, sprocket and chain reaches should be faint. Under no circumstances should a base line be used in outline work. Advertising is so sure a sign of character in a business house, nowadays, and is so closely studied by the general body of readers, that it is the duty of agents to furnish in illustrative work what is recognized as modern, artistic and business-like.

\* \* \* \* \*

In casting up accounts between the three chief factors in the cycle trade, it is seen that the maker has been squeezed harder by the dealer than the latter has been squeezed by the public. The discount to the trade on new goods is about the same as it was a year ago, though list prices have been materially reduced. In view of this, the agent owes it to the manufacturer that he shall sell for cash as often as possible, shorten the period of installment sales, expand his trade, and thereby secure himself and the firm from which he obtains his supplies. If these things are not done, and competition among manufacturers goes on increasing, there will be a thinning out of both makers and dealers. It is the current impression among makers that the period of greatest activity in competition is now at hand, and that all the trials which have been endured till this time have been mild in comparison to the severity of the ordeals which are yet to come.

# STEARNS BICYCLES

"That exquisite something called style, which, like the grace of perfect breeding, everywhere pervasive and nowhere emphatic, makes itself felt by the skill with which it effaces itself, and masters us at last with a sense of indefinable completeness."

Bicycle talk covers many subjects—but it always gets back to the style and quality of the wheel.

The intrinsic merits of different bicycles are important not alone to the dealer, but to the purchaser, who is, after all, the determining factor.

What has put the stamp of popular favor upon the Stearns?

It is a structural unity.

It is stiff, without loss of elasticity; its weight is in the parts that bear the rider; its lightness is in the parts that make the speed; its strength is in all.

The Stearns bicycle crystallizes in itself the best work, the best material and the best ideas of the times.

There is no agency more valuable.

The trade on the Pacific Coast supplied from our branch store, E. C. Stearns & Co., 210 McAllister Street, San Francisco.

**E. C. Stearns & Company,**  
Syracuse, N. Y.

The trade in the Dominion of Canada supplied from our Canadian factory, E. C. Stearns & Co 67 Adelaide St. West Toronto, Ontario.

## SNELL BICYCLES

—1899—

"STRICTLY HIGH CLASS"

New designs, valuable, up-to-date, exclusive features which attract the eye, satisfy the rider and merit the approval of the most critical.

New York Distributing Agents: HARTLEY & GRAHAM.

## MAKERS SCORN CYCLE SHOWS

### Another Volume of Testimony in Support of the Uselessness of Such Exhibitions

If any doubt ever existed in the minds of individual manufacturers touching the temper of the general body with respect to national cycle shows it is by this time thoroughly dispelled, for the wholesale condemnation of such enterprises vented through the medium of the Cycle Age has crystallized a belief which the National Cycle Board of Trade held to be true, but which calumnious detractors of that expiring institution scorned to accept. The bicycle industry is even superior to show promoters—and that is saying much in the worshipful presence of Sanger and Van Sicklen.

In some inscrutable manner these show promoters have conceived the idea that the bicycle trade is sick—so sick that it is like to die if they are not called in to minister to its needs. The truth is, however, the trade was never so healthy as it is at this moment, and its robustness is plainly discoverable in the demonstration of scorn it displays at the approach of the promoters.

#### Superstition of Cycle Shows.

It is storied by the witty Lamb in his "Dissertation on Roast Pig" that the origin of that toothsome dish is traceable to the accidental burning of a house in which the grunter had his abode, whereupon the sorrowing owners devoured the animal and pronounced the flavor so delicious that whenever after they wished to feast on the same food they turned to incendiaryism. Similarly with some in the cycle trade. Their fortunes grew in the years when cycle shows flourished, and they are in the habit of ascribing all luck to such accidental sources.

Herewith are presented some more opinions concerning shows:

#### Will Not Exhibit at Any Show.

We do not take any interest whatsoever in cycle shows. We do not expect to exhibit any of our goods at any cycle show whatsoever. We think the time has gone by for cycle shows, and do not believe it will help the business in any way.

WESTERN WHEEL WORKS.

#### Will Not Spend Money on Shows.

We are not in favor of cycle shows, either local or national. We do not believe that they are needful to the industry, nor do we expect to be induced to spend our money for such advertising.

REMINGTON ARMS CO.

#### Ten Times More Harm than Good.

We believe that cycle shows should be local. Not one agent in a hundred attends a national show, and we think that national shows do ten times as much harm as they do good. Local shows in the latter part of February and March no doubt create an interest and help the business.

H. A. LOZIER & Co.

#### Money Better Spent on Traveling Men.

We are not in favor of cycle shows as conducted by the manufacturers, whether they be local or national, believing that the amount spent in conducting the exhibitions at such shows could be more remuneratively expended in placing their goods before agents by traveling men.

TRINITY CYCLE MFG. CO.

#### Wisdom in Abolition.

We are not in favor of shows, either as a local or national institution, and we think the old Board of Trade acted wisely when they decided to abolish them.

KEATING WHEEL CO.

#### Will Hurt the Exclusive Dealer.

In the writer's opinion, cycle shows, either national or local, will cause a general demoralization in the bicycle trade so far as the exclusive bicycle dealer is concerned. Such good wheels will be exhibited at prices that will not exceed \$25, that the general

public will refuse to pay more. As a bicycle dealer cannot live on those margins, naturally the customer will go where he can get the machine at the price he is willing to pay, and only those people who are handling bicycles as a side line can afford to do the business on that margin. Looking at the matter from the standpoint of taking an interest in the exclusive bicycle dealer, I cannot say that I am in favor of cycle shows.

C. S. DIKEMAN.

#### Big House Will Not Exhibit.

We do not approve of cycle shows, and do not intend to exhibit either at the New York or Chicago show. We are not in favor of national, local, or, in fact, bicycle shows of any kind.

AMES & FROST CO.

#### Wait for Developments.

The developments of the next few weeks will probably demonstrate whether the shows are to become a prominent trade factor or not.

A CLEVELAND MANUFACTURER.

#### One Way to Burn Money.

This country has passed through a terrible depression during the past five years, and being engaged in several other manufacturing industries as I am, I have tried to keep them all going, which has given me a large amount of experience and has cost a good many dollars. Now, if I had more money than I knew what to do with and wanted to throw it at the "birds," I might be in favor of holding shows in New York, Chicago, Toledo and every other place.

ALVIN PETER.

#### Responsible for Present Troubles

I have never been an advocate of cycle shows, believing that it was a detriment to all large manufacturers who employ their own travelers to solicit trade, as it enables the small manufacturers to attend the cycle shows and market their product without employing any travelers to visit the trade. Consequently, without an expense of that kind, they are able to quote prices that a large manufacturer who has a good traveling staff, would be unable to quote, as the expense of visiting the trade is quite an item, and I believe that the cycle shows of the past are largely responsible for the bicycle business being in its present chaotic condition.

OHIO MANUFACTURER.

#### Will Exhibit Under Protest.

On the whole we are not in favor of bicycle shows, either national or local, although we have taken some space in the forthcoming show at Madison Square Garden.

E. C. STEARNS & Co.

#### Opposed to the Expense.

I am, as a rule, opposed to the expense of bicycle exhibitions, but I believe that one exhibition can be held each year in the Madison Square Garden, under that prince of exhibition managers, F. W. Sanger, and be made a success. That exhibition should be for the buying public and not for the dealers. I do not favor exhibitions for dealers.

ALBERT A. POPE.

#### Shows Debauch the Industry.

We have not believed cycle shows needful or beneficial to the trade. We did not exhibit in '95; we did, however, in '96 and '97 at both New York and Chicago. Possibly in the very early history of the industry shows were helpful in calling the attention of the general public to bicycling, but we consider that the business has been so thoroughly established since '94 that national cycle shows are not necessary to legitimate manufacturers. We believe that instead of being beneficial, it lowers the standing of the industry among the large industries of the country. It has always been our policy to market our goods through legitimate channels of trade, and in the same way that other staple goods are marketed. A so-called national cycle show deters many of the retail dealers, in the territory adjacent to where the show is held, from placing their orders until after they have attended the show. When they reach the show they become confused from the multiplicity of machines which they see, and often make a selection more hurriedly, and with not as good results to themselves as they would have made with the traveler

at their own store. A national cycle show held at the present time would bring together, in our opinion, not the largest and most enterprising of legitimate manufacturers; but, on the other hand, certain jobbers of machines would exhibit, and a large number of the smaller manufacturers who have not the financial backing to enable them to put out a corps of travelers, and the so-called show would develop into a large auction house. As for ourselves, we shall not exhibit at any cycle shows this year. From conversation we have had with some of the standard makers of the country we believe that there are a goodly number that feel as we do. We have not a word of criticism to offer, or a word of objection to make to any one who desires to exhibit at a cycle show, thereby, in our opinion, putting their goods, as it were, into an auction house. These are questions of policy to be determined each for himself. In the matter of local shows, when properly managed, under the auspices of the local dealers where they expect to retail goods, in some instances they may be beneficial, although we very much doubt any benefit arising even from a local show.

THE GENEVA CYCLE CO.

#### No Need for National Shows.

Just at this time we are not in favor of the idea of holding shows, unless, indeed, they are purely of a local character. The trade generally is just emerging from a period of price depression and overstocked domestic markets. No manufacturer will say that the sales made at any of the so-called "national shows" were on a paying basis. Rather will it be admitted that the prices prevailing were forced ones, secured by visiting dealers through the processes of imagined competition. Again, the extravagant expense of the exhibitions is no small factor. So long as the Cycle Board of Trade was in control, a judicious restraint was exercised on this question. Now, however, that the Board is dissolved temporarily, these same "promoters" that called this restraint into existence by means of their exorbitant demands and larger personal profits, are again seeking to regain the confidence of the trade and impress on all the necessity of shows. There is yet a demand for an honestly made, fashionably designed bicycle. Even the cheaper wheels of the better class are in demand and appreciated. The day of the cheap trash, however, is gone. So the plea of "loss of interest by the public" cannot be adduced as an excuse for a "show." We believe that what the manufacturer wants is a year of rest and fair prices. Then, in 1900, when the new century smiles on our new America, we might be in favor of a show. Make it a grand one at that. Include motor cycles and carriages of all descriptions. Make it of a broad national character, under the control of the trade and absolutely removed from any connection whatever with any promoter or aggregation of them. Until then we are opposed to a show, either in the east or west. When it is held, some central point should be selected, and the opening date be January 1, 1900.

THE THOMAS MFG. CO.

#### Old Shows Held Too Early.

I believe that, properly handled, an exhibition in Chicago and one in New York for the bicycle riders is a desirable thing. Exhibitions in these two cities would draw the people from all over the country, as there is always a large number of people in these two cities at all times, so that they really become almost national exhibitions. Enthusiasm in bicycles can be kept up in no better way, it seems to me, than by exhibitions like this, and February or March I should think would be about the proper time. The evil of the old exhibitions was that they were held too early. They gave one manufacturer a chance to copy the models of others, and were too early for the rider.

NEW ENGLAND TIRE MAKER.

#### Hope Shows Will Reawaken Interest.

There are a great many different views on the show subject, and while some of them hold good in one locality, it is our opinion that they will not do so in others. We gave the subject of cycle shows this year considerable thought, and finally decided to go into the one to be held in Madison Square Garden. We do so, hoping that a show of this character will put new life into the cycle business and increase the interest among both riders and prospective riders. As for its delaying the purchase of goods by agents throughout the country, I think it will have no such effect as that upon the trade whatsoever, as the majority of agents throughout the country have learned that it is well for them to stand by the product that they have handled successfully in the past.

AN EMPIRE STATE BICYCLE CO.

#### Shows Overcrowded the Industry.

During the time that the national shows were in vogue, we were very much benefited by them, and we would have been more so had they been held in December instead of January and February. This, however, also has its drawbacks, on account of various dealers not being able to attend the cycle show on account of the holiday trade, as

there are very many dealers who have holiday goods besides bicycles. Our opinion is, that we should not have national cycle shows, but we believe that local cycle shows in the various cities would greatly benefit the local trade, to enthrone interest in bicycling; but as for a national show, with an aim of securing orders, etc., for the manufacturers, we do not think they would be desirable at this time, as we feel positive that the cycle shows have had a great tendency to interest other capital and increase the number of bicycle manufactories, as they are put on an equal footing with the large manufacturer, who employs salesmen to solicit the trade, and very little of this will be necessary if national shows are held; and the small dealers, on account of having no expense in marketing their goods, will be put in a better position to compete with the legitimate manufacturers. The result of so many manufacturers starting in the business is apparent.

PENNSYLVANIA MANUFACTURERS.

**Will Not Exhibit.**

We do not think that at this time that cycle shows are advisable, and cannot see our way clear to take part in any such exhibitions. While it is true they may result beneficially to a certain part of the trade, we do not think that the results will be in proportion to the expense necessary to make an exhibit.

GILLIAM MFG. Co.

**Want Nothing to do With a Show.**

Our idea of the cycle show is that it is a big nuisance, and we want nothing to do with it.

HUNT MFG. Co.

**Only Show Promoters Profit.**

We believe cycle shows have lost their usefulness. They have always been an extravagant method of advertising, and were profitable, in our opinion, chiefly to the promoters of the show. They amount really to a local exhibition, the percentage of those who come from a distance being too small to take into account. We shall not exhibit at any cycle shows should they be held.

KIRKPATRICK SADDLE Co.

**February the Month for Shows.**

We are in favor of holding cycle shows for the purpose only of stimulating the public interest. This method of advertising has two advantages—the impression made on those who attend, and the influence of the prominent reading notices given in all daily papers and in many periodicals. To get the full benefit without the disadvantage of having the agents wait to decide upon their lines, shows should be held at a time shortly preceding the riding season, say, the middle of February, and as it is a well-established fact that the population of all the states follow the fashions and doings of the largest centers, two or possibly three national exhibits in, say, Boston, New York, Chicago, would, we think, give the best returns for the money invested.

THE MESINGER BICYCLE SADDLE Co.

**Stimulate Sales of Sundries.**

We believe that shows are of benefit to the manufacturers of bicycles and bicycle sundries, not, however, as far as sales are concerned to the dealers or jobbers, but as they apparently have an effect upon the interest of the consumer and seem to arouse the enthusiasm of the purchaser in connection with the bicycle business. We believe that business in bicycle sundries would have been better last year had there been a cycle show. Possibly every other year may be sufficient to stimulate the interest of the consumer, and we think that the early part of February or the middle part the best time for the exhibition to be held. Possibly, however, a later date than this might be even better; not after the cycle season has actually opened, but at that period of the year when the consumer is beginning to think of looking over his wheel and taking an inventory as to what his requirements are going to be for the coming season.

EASTERN LAMP MAKING Co.

**January Shows are Too Late.**

We believe in national cycle shows, providing they are handled on a businesslike basis. We have already taken space at the New York cycle show and may decide to exhibit at the one to be held in Chicago. We believe that these shows should be held earlier, say, in November, or early December at latest. The question of holding local shows is one that in our opinion should be decided by local dealers, for conditions differ in various localities. We are, however, of the opinion that local dealers holding shows cannot expect much assistance from the manufacturers inasmuch as present prices and margins will not justify so large an expense.

THE VEEDER MFG. Co.

**Favor a Small Show in Chicago.**

We think that the cycle trade is ripe for some sort of an exhibit, and we think that it needs it. While we do not consider it nec-

essary for the bicycle people to go in so heavily and spend much money; still, an exhibit of this kind will benefit the trade, as it brings in the small merchants and allows them to see the goods which they intend to purchase, all in one place. We will be glad to have Chicago have a cycle show, and will do what we can to make it a success.

CHICAGO HANDLE BAR Co.

**Decidedly Opposed to All Shows.**

We are opposed to cycle shows at any time or place. It is our belief that the cycle trade has not been benefited by them in the least, and we think that the best thing the Cycle Board of Trade ever did was to discontinue the national shows. We note that arrangements are being made for local shows in New York and Chicago, but we shall not exhibit at either of them.

INDIANAPOLIS CHAIN & STAMPING Co.

**Object to Any Kind of a Show.**

In our opinion cycle shows do not pay for themselves from the manufacturers' point of view. They do no doubt stimulate trade in a general way to a certain extent, but we do not think sufficiently so to warrant the necessary expenditure. We are decidedly against them in any form.

THE NEW DEPARTURE BELL Co.

**Shows Prevent Even Distribution.**

Our opinion concerning cycle shows has been that they are a decided detriment to the trade, as they retard business and make the bicycle industry one grand rush to fill orders that should be distributed more evenly during the year. It may be, however, that a show stimulates interest that is otherwise lacking.

AN EASTERN TIRE HOUSE.

**Parts Makers Object.**

As parts manufacturers we are decidedly against cycle shows of any kind, as we have never found that they helped us in any way, but, instead, take up a great deal of time that could be spent to better advantage in other directions. As regards cycle shows for the bicycle manufacturer, that is a subject on which we are not in position to express an opinion.

C. J. SMITH & SONS Co.

**Absolutely Indifferent.**

We have no interest, one way or the other, in cycle shows.

BARDONS & OLIVER.

**Will Not Exhibit.**

We shall not exhibit at any of the cycle shows.

THE CLEVELAND MACHINE SCREW Co.

**Not Wanted by Chain Makers.**

We do not favor shows.

A NEW ENGLAND CHAIN Co.

**Do Not Want a Show.**

I am not in favor of holding a cycle show.

EUGENE ARNSTEIN.

IN FOREIGN MARKETS

Miscellaneous Information Pertaining to Honduras, Cape Colony and Syria.

In the markets of Honduras the United States leads all foreign competitors and secures the bulk of orders from importers. In some lines, however, the English have all the trade. The great drawback to imports is the duties. The published rates are so much a pound; but there are additional charges, which make the tariff about double. For instance, a party bought two and one-half kegs of nails in the United States; when the duty was paid, they cost \$11.20 gold. Another party bought \$78 worth of furniture, the duties per published rates being 26.32 pesos (the peso being worth about 43 cents); 5.04 pesos were charged for weight, plus 30 per cent, plus 20 per cent, plus \$10.50 for paper at custom-house, making the total 59.42 pesos, or \$23.76 gold.

In Syria there is no lack of appreciation of the excellence of American goods, but the cost of transportation adds heavily to their price. Our sewing machines are in strong demand. With direct steamship facilities, many lines of American products would find ready sale.

It is claimed by business men in Cape Colony that the English and French houses are poorly represented by their travelers. The English travelers are

generally young men who have worked in the office until they are run down in health and who go abroad for a change, with no knowledge of the business except that gained behind a desk. French firms are willing to accept as representatives abroad men who have failed in their own country. The United States manufacturers send out a high class of representatives—astute men, who have large and varied experience in their respective lines; men educated in the details of the business they represent; men of the age that brings wisdom and accuracy; men that earn and command large salaries; men of energy and vigor.

IN A FLOURISHING CONDITION

Commercial Report Says 1898 Will Be Banner Year in Commerce of United States.

The flourishing condition of our commerce at the present time, both interstate and foreign, which must have a marked effect on the bicycle trade next year, is strongly reflected in Bradstreet's commercial report for last week. It is as follows:

The business world enters on the closing month of the year with so many favorable and so few depressing features in sight as to leave little doubt that the year 1898 as a whole must hereafter furnish the basis for estimate when comparisons of large business are to be made. Nearly all obtainable statistics and reports as to the volume of business point to the present year having heavily exceeded any former year in the amount of business done, and though comparisons as regards prices are not so favorable as in earlier years, notably 1892 and 1890, when quotations of most staples were considerably higher, still the expansion in trade, due to increased population and enlarged foreign demand for our products, has resulted in an aggregate volume of business done considerably in excess of any former year. Strong confirmation of this latter view is found in recently compiled statistics of bank clearings, railroad earnings and other measures of business conditions.

Exports of Bicycles and Materials.

Exports of bicycles and bicycle material from the port of New York for the week ending November 29, are recorded as follows:

	Bicycles.	Materials.
Africa .. .. .	\$10,412	\$ 775
Belgium .... .	479	731
England .... .	2,221	3,006
Germany .. . .	5,349	8,548
Japan ..... .	1,000	.....
Sweden ..... .	.....	3,276
France ..... .	.....	225
Italy ..... .	.....	261
Switzerland .. .	45	.....
Holland ..... .	679	.....
Egypt ..... .	50	.....
Siam ..... .	895	.....
Hong Kong ..... .	450	400
British East Indies .. . .	.....	340
British West Indies .. . .	818	362
Cuba ..... .	17	.....
Porto Rico ..... .	210	.....
South American countries....	202	98
Totals .. .. .	\$22,627	\$18,022

Exports Largely Exceed Imports.

The following table shows the imports and exports of American manufactures since 1880:

	Imports.	Exports.
1880.....	\$268,333,432	\$102,856,015
1881.....	284,763,615	114,233,219
1882.....	322,036,663	134,794,346
1883.....	337,264,528	134,228,083
1884.....	304,352,393	136,372,837
1885.....	265,704,352	147,187,527
1886.....	285,050,564	136,541,978
1887.....	306,030,440	136,735,105
1888.....	324,823,601	130,300,087
1889.....	328,629,989	138,675,507
1890.....	346,638,654	151,102,376
1891.....	368,225,181	168,927,315
1892.....	316,092,469	158,510,937
1893.....	356,866,396	158,023,118
1894.....	234,139,173	133,728,808
1895.....	317,257,176	133,595,748
1896.....	328,937,528	228,571,173
1897.....	327,324,920	277,285,391
1898.....	226,212,635	291,208,358

The imports in the year 1898 were 30 per cent less than in 1888, although the population had increased 25 per cent meantime.

## AUCTIONS DEMORALIZE TRADE

### HIGH PRICES RULE, HOWEVER

**American Bicycles, Properly Handled, Hold Their Own in Australia—Opening for American Parts.**

Sydney, Nov. 5.—The state of the cycle trade in Australia at the present time is not satisfactory to the many agents, and if this coming season is not a particularly busy one with some of them, they will be compelled to close up. The Austral cycle agency, the largest retail concern in Australia, with branches in every colony, is among the number. At one time it had a monopoly of all the best English machines, but has lost them all, with the exception of The Swift and the Triumph, which it is now booming in a sensational manner. Recently the company held several auction sales in both Sydney and Melbourne, which were successful from its point of view, but there is not the slightest doubt that these auction sales do much harm to the trade. It is not likely that people will pay \$125—which is the lowest price a really first-class wheel is sold at—when they can go to the auction room and purchase a machine for about \$50.

There have been many auction sales in Sydney and Melbourne of late, and only on October 31 fifty machines of two leading American makers were sold in Melbourne without reserve. It is principally American wheels that figure at these sales, and some of them are not heard of until put up at auction, where they very seldom bring more than \$45.

#### Sales Spoiled By Mismanagement.

American goods up to date have not received fair play in Australia, and, with the exception of one or two agencies, are not properly handled. The following instance will give some idea of how business transactions are conducted. A New York state manufacturing company recently appointed a local cycle company sole agents in New South Wales for their line. This company did not push the machines at all, and of course did not sell many. They afterwards complained that they had not received any duplicate parts, and consequently repairs were effected with great difficulty. The agency was handed over to I. Phizacerly shortly afterwards, and he was sent fifty machines, supposed to be 1898 pattern, but on receiving them he found that they were 1897 pattern. He should also have received a box of duplicate parts, but instead they were sent to the cycle company which had relinquished the agency. To make matters still worse, about a week after Phizacerly was appointed agent Peabody & Co. put fifty machines of this make into the auction room for sale. Phizacerly complained bitterly, but he is now doing fairly well with the line at \$85 to \$100. American manufacturers should deal direct with the agent and leave the middlemen out of the running altogether.

#### Examples of American Successes.

American wheels of high grade, if properly handled, more than hold their own with the British product. As an example, the Sydney Cycle company is sole agent for the Cleveland in New South Wales and handles the Cleveland almost exclusively. It has nice premises, runs its house on up-to-date lines, advertises judiciously, and as a consequence is one of the busiest, if not the busiest, firms in New South Wales. It lists the Cleveland at \$125 and can sell them almost as fast as they can land them. Take also James Smith & Sons, of Brisbane, Rockhampton, and Charters Towers, Queensland. This firm holds the agency for two En-

glish machines and one American, the Stearns. It makes the American the leader, handles it properly, and is progressive, and the result is that the Stearns is the most popular bicycle in Queensland. Very few American wheels are represented in Western Australia.

#### Native Manufactures Growing.

There is a good opening in Australia for American parts. In every colony there are a lot of local manufacturers who build from English parts, principally B. S. A. and Perry's. These Australian-built machines hold their own with the imported article. The very cheapest make sells at \$62, while others run as high as \$125. The Dux is one of the best. It is built of B. S. A. parts by the Dux Cycle company, of Melbourne. Next to the Dux comes the Bell, built by a New South Wales firm from Perry's parts, and sells from \$85 upwards.

Of the American machines on the Australian market, the Cleveland, Columbia, Dayton, White Flyer, Stearns, Monarch, Rambler and Union are most popular. The Columbia chainless is the best of the chainless bicycles, but the price of \$150 asked by the New South Wales agents is almost prohibitive.

There are on the Australian market at present English, American, Canadian, Italian, German, French and home-made bicycles, so the Australian has a sufficient choice.

#### Pointers on Equipment.

Hickory handle bars are coming much into favor and hundreds of riders are to be seen daily with them fitted to their mounts. They are not likely to supersede the steel handle bar, however.

The appearance of a machine as it stands in an agent's show room has a great deal to do with its sale. Many of the American manufacturers do not seem to recognize this fact and send out the upturned handle bars, which do not add to the appearance of the machine, and the agent shows the machine with these bars, that are never used here except by aged gentlemen. If the samples were fitted with attractive bars and other equipment, the sales of American machines would be still larger.

The wood mud-guard should be discarded altogether. It is never used, for the simple reason that the average Australian does not bother about mud-guards at all; and such as do buy the rubber guards, that cannot be noticed when in use.

#### Gear Cases Not Popular.

Much has been written as to the desirability of fitting gear cases to American wheels. For the Australian trade American manufacturers need not bother about gear cases, as 90 per cent of the riders do not use them, and, if the writer is not very much mistaken, they never will.

The most popular style of machine at the present time is a 22-inch frame fitted with 28-inch wheels. Anything higher than 24 inches is not in much demand, although of course for very tall riders a 26-inch frame is desired, though very few are purchased.

#### Gendron Co. Adopts Union Label.

The Gendron Wheel company of Toledo has adopted the union label of the Bicycle Workers' International Union, and hereafter all machines turned out by the company will bear that mark. The representatives of the union are greatly pleased by the action taken by the Gendron company, and believing it to be a forerunner of future achievements in this line, will begin active work in other cities. President Mulholland says: "This step of the Gendron people shows them to be in advance of their competitors on this question, and is one that cannot fail to be recognized by organized labor."

## SINGLE TUBE TIRES IN FRANCE

### INTRODUCTION HAS BEEN SLOW

**Clement-Gladiator-Humber Support of Dunlops Discouraged Their Sale—Situation Now Favorable.**

The single tube tire has had greater obstacles to overcome in France, probably, than anywhere else. In addition to the fact that detachable tires were the first to come into use, and that the French people, like other Europeans, are slow to adopt new things, there have been some barriers to the introduction of the single tube tire in France which have not existed elsewhere, quotes the India Rubber World from George R. Ostheimer, of Paris.

In the first place, three of the leading French bicycle concerns formed a syndicate, under an agreement to use only the Dunlop tires on their machines. These were Clement & Co., makers of the Clement bicycles; A. Darracq, maker of the Gladiator, and Humber (France). When it is considered that these firms control more than half the bicycle trade of France—possibly two-thirds—and that their example doubtless has had an effect even upon that portion of the trade not under their direct control, it is easy to see how potential their action must have been in discouraging the sale of single tubes.

#### Reduction of Detachable Tire Prices.

The Dunlop people organized a company in France (Compagnie Francaise Pneumatiques Dunlop), with a capitalization of \$3,500,000. Their first step was to seize tires made by several French rubber concerns, against whom they brought suit for infringement. The defendants combined to protect their interests, the litigation ending in a decision against the validity of the Dunlop patents in France. As a result, nearly every rubber factory in that country began making tires of the Dunlop type, and generally at much lower price than is charged by the Dunlop company. Consequently, when a good single tube tire is offered in Paris today, its price is higher than that of many makes of detachable tires, whereas in England the lowest prices for tires of this class are still much higher than the single tube sort. While this patent decision gave the Dunlop company a setback, it still has the powerful support of the Clement-Gladiator-Humber combination.

#### Repairmen Unfriendly to Single Tubes.

The tire repair shops in France are still controlled for the most part by interests unfriendly to the single tube tires, and every attempt is made to cultivate a popular belief that the single tubes are hard to repair. But even when a favorable impression has been made by the single tube, it does not follow that the cyclist will at once invest in a pair. If his wheel rims have been channeled for Dunlop tires, as is most likely to be the case, he will feel like continuing to use the Dunlops until the need comes for a new wheel. The introduction of single tubes anywhere in Europe must come about through influencing the manufacturers of bicycles to use them as a part of their equipment, and it will be found easier to influence the producers on a small scale than the large manufacturers. As for American tires, it must be remembered that France has two schedules of import duties—a "general" and a "minimum" rate—and that the former is applied, as a matter of discrimination, to goods coming in from the United States. In spite of this formidable list of discouraging influences, Mr. Ostheimer expressed the firm conviction that single

TRADE MARK

**More Significant Opinions From Agents**

(From Cycle Age of Sept. 15th.)  
 "In the \_\_\_\_\_ bicycle the tires are not cemented on well, and invariably have to be re-cemented before the wheels can be put in use. With closer attention to better tires, etc., it would be a most desirable wheel for my trade."  
 GEO. W. ARSTIN, Central Lake, Mich."

"Tires cannot be repaired simply enough to suit the riders. The cheap single tube has injured the whole single tube family."  
 ROSCOE LANGLEY, Silverton, Ore."

"I prefer a good, guaranteed single tube tire to any other on the market; they will hold air better and are more easily repaired, and when they are beyond repair will then make a good casing that will outwear most of the ordinary casings, which are too light and thin."  
 THEO. H. BOLTE, Kearney, Neb."

(From Cycle Age, Sept. 22nd.)  
 "Tires are not, as a rule, well cemented onto rims at factory."  
 L. R. ADAMS, Demorest, Ga."

In other words, when it is no longer any use as a single tube tire its usefulness can be prolonged by converting it into a double-tube.

"My ideal wheel would be a \_\_\_\_\_ chainless, with detachable tires, etc., etc."  
 E. H. HINMAN, Atwater, O."

"One other thing is the Dunlop Tire fitted on Crescent wheels at the same price as the single tubes. This has been a great success as compared with any other tire, and I recommend it in every respect. We have had an unusual demand for cheap single tube tires, and they have given universal disappointment and trouble."  
 GARDNER R. HATHAWAY, Marblehead, Mass."

(From Cycle Age, Sept. 29th.)  
 "The cheap single tube tire has injured the whole single tube family to some extent, and next season will see the detachable tire more popular than in any season since the advent of pneumatic tires."  
 E. L. JENNINGS, Huntington, Va."

"We have always advocated single tube tires until this season, but will in future push some style of double tubes."  
 C. H. WHITMORE & Co., South Bend, Ind."

"I would like to see a single tube tire at any price that will take the place of a double tube clincher variety of good quality, with customers who have once used the latter. I find wonderful apostles for the single tube kind, but none that have once used the double tube clincher. Tires generally decide a dealer in the handling of his high grade wheel, and a mistake in that decides the fate of the wheel in the community."  
 GEO. A. HOOVER, Fayette, Ia."

36-38 Lombard St., Toronto.

TRADE MARK

**WOULD YOU HIRE**

a one-legged salesman to show your wheels?

**Cheap tires are one-legged salesmen.** Always and everywhere, lifeless and slow, they are a positive injury to any decent wheel.

**Speed is not an accident, it's a result,** and springs invariably from the same cause—the right rubber in combination with the right fabric. And there aren't half a dozen right rubbers and fabrics; only one grade of each produces speed—Fine Para rubber and selected Sea Island fabric. The supply of both is limited, and the price ALWAYS HIGH. No manufacturer can afford to use either in cheap tires.

**Now, you want your wheels to run their best and look their best, don't you?** Then give them able-bodied tires, made of live, springy, Fine Para rubber and strong, elastic Sea Island fabric.

**These two go into Leagues—and nothing but these,** no soft rubber, no substitute, no cheap fabric. That's why "Get There and Get Back" Tires fairly bound with life and lightness.

**LEAGUEKIT**

the puncture doctor, mends single-tube tires. Makes quick and sure cement repair, or quick and sure plug repair—only tool that does the work of two kits at the price of one. Being catalogued by large dealers everywhere. Better drop us a line.

**NEW YORK BELTING & PACKING CO. LTD**

Mention The Cycle Age

tube tires are winning favor in France and constantly finding wider use. He thought it not improbable that in the end single tubes might suddenly become adopted on a large scale, as was the case with the vehicle tires. Better facilities exist now than formerly for getting these tires repaired, while riders are learning to mend them themselves.

### CHEAP CYCLES AS LEADERS

Dealers Throughout Kansas Will Push Low Priced Goods Next Year—Money Plentiful.

Topeka, Dec. 6.—An extensive tour of Kansas discloses the fact that the average dealer expects the coming year to be characterized chiefly by a general demand for cheap bicycles. All indications point to this. There is more money in the state than there has been for twenty years, owing to high prices received for crops and cattle, and the people and land are marked by a general air of prosperity, but there has been within the past few years a revulsion of feeling against high-priced bicycles.

When the manufacturer of a well known high-priced machine recently knocked \$50 off the price of his leader, it did not create more than passing comment in this state. Even at the greatly reduced price, the prospective purchaser feels that he can satisfy his wants for less money.

One dealer in Hutchinson carried several lines at different prices, but one of his cheap machines, scarcely known at the opening of the season, had the best run, and he confidently expects to make much progress in a business way next season by pushing this machine as his leader. In Wichita, Arkansas City, Newton, Dodge City, Lyons, Sterling, Nickerson, Wellington, Winfield, Fredonia, Parsons, Pittsburg, Kansas City, Leavenworth, Atchison, Manhattan, Junction City, Abilene, Clay Center, Concordia, and Washington—all in Kansas—the feeling is the same, and the local dealers have hopes builded high on the cheaper lines.

### Safeguarding Against Accidents.

Any bicycle put on the market today which does not contain in its mechanism the practical improvements which have in view the safety of the individual rider and the safety of the public should be condemned by public authority, for they are a menace to limb and life, writes P. W. Pratt, of the Robert Malcomb Co., of San Francisco, to Cycle Age. Observations on the hilly streets of the Golden Gate have given him positive views on this subject. The law of common sense, he says, teaches the necessity for a brake and bell by day, and a lamp at night. Sooner or later the ordinances of every town and city will require all of the above appliances in their most improved form. The rider must have the power to stop his bicycle quickly and positively in any emergency, and must sound an audible warning by day and carry a visible signal by night of his swift and silent approach. As the use of the bicycle extends year by year, an effectual brake and a good lamp become indispensable necessities, which are more and more being demanded in progressive municipalities. Every precaution against accident should be taken by manufacturer, dealer and rider to prevent any indictment against the bicycle on account of danger, and to cultivate a general sense of utility and security in the widespread use of these invaluable aids to human transportation.

### More Para Rubber Will be Used.

"There is every prospect of coarse Para rubber keeping up in price," said a tire manufacturer recently. "Last year a lot

of manufacturers used African grades in tires, with the result that the demand for coarse Para seemed likely to become less pressing. But the African rubber did not stand the test of wear, and now some of those manufacturers wish they had stuck to Para rubber. And there was enough African rubber used by people in this class to make a difference in the cost of the other sort when the tire people come to filling their requirements for this season."

### PULL-OUT FRONT FORK STEM

Suggestion for Facilitating Front Fork Repairs—Also of Value for Tire Mending.

It is an annoying feature of front fork repairs that the steering head bearings must be taken apart and reassembled every time the front forks are removed from the bicycle. Steering head bearings are usually without ball retainers and some time and care must be given to handling these bearings, even though the occasion is merely a three-minute job of some kind on the forks. There being no need of taking steering head bearings apart during the riding season except for the removal of the front forks, it is obvious that a pull-out device on steering heads, by means of which the forks could be removed without disturbing even the adjustment of the bearings, would be as desirable as pull-out hub and hanger axles intended to make more handy the work of removing and replacing wheels and hanger parts. That a pull-out steering head stem is not common seems to be mainly because it has never as yet been publicly tried.

In the illustration is shown a form of steering head with the pull-out feature.

The design is not given as the best, but merely as a suggestion. It can be changed to suit any builder's tastes. As here shown, the steering head is of large diameter and all cups inside, leaving the outer surface flush. This feature has, however, nothing to do with the pull-out scheme. The lower ball cup, A, is inverted and screws into the lower end of the steering head tube, abutting against a shoulder to avoid the necessity of a lock nut. The upper cup, E, is also inverted, and screws into the head in the same manner as the lower, except that it is run down into the tube far enough to allow for a washer, F, and lock nut, G, above, the lock nut also screwing into the threaded end of the steering head tube. A cylindrical sleeve, D, is formed with seatings at its ends for the cones, B. The bearing is then complete when this sleeve, the cones, cups, balls, washer and lock nut are in place. The cups can well be fitted with ball retainers. The lower end of the sleeve is provided with serrations like the teeth of a saw and around the lower end of the front fork stem, which is turned to fit the interior of the sleeve snugly, is a shoulder, C, the upper face of which is provided with serrations matching those on the lower end of the sleeve. The upper end of the stem is threaded in the

usual manner and a long cylindrical lock nut, H, with spanner holes, K, around its upper end, is adapted to screw on to the stem after the latter has been slipped inside of the sleeve, and by being tightened till it bears firmly on the upper end of the sleeve, locks the stem and sleeve together, thus making the fork stem a part of the bearing. The handle bar may be fastened in any of the popular ways. In the illustration the bar is provided for by a clamp, J, which binds around the upper projecting end of the stem and which carries a forward extension clamp for the bars. As before mentioned, the minor details of design, such as cone and cup shape and arrangement, bearing locking device, and handle bar fastening, may be varied to suit the designer.

### NEW INCORPORATIONS, ETC.

Chapman Bearing Co. and Tire Inflating Co. Incorporate in Maine—Wilhelm Co. Reorganizing.

The Automatic Tire Inflator company has been organized at Portland, Me., for the manufacture and sale of patent tire inflators, with \$50,000 capital stock, of which nothing is paid in. The officers are: President, William Howard Paine of Providence, R. I.; treasurer, Mary Elizabeth Paine of Providence, R. I.

The Chapman Double Ball Bearing company has been organized at Portland, Me., for the purchase and control of an invention known as the Chapman double ball bearing, with \$500,000 capital stock of which nothing is paid in. The officers are: President, Chas. H. Chapman of Groton, Mass.; treasurer, Levi Wallace of Ayer, Mass.

The New England Tricycle company, which was burned out in Tyler City, Conn., recently, has taken new quarters in New Haven, where it will continue to make tricycles. The concern employs about fifty hands.

The Wilhelm bicycle factory in Hamburg, Pa., has been temporarily shut down pending a reorganization of the company and an increase of capital stock to extend the works and increase the capacity.

The entire outfit of the Gem Cycle Works of Toledo, O., has been purchased by Barnum & Shirley and moved to a new location.

Merriman Bros. & Co., of Ft. Atkinson, Wis., are adding the necessary facilities to their shops to undertake the manufacture of bicycles on a limited scale.

### CHANGES AMONG DEALERS

Dissolutions of Partnerships, Changes of Location, New Agencies Placed and New Business.

The bicycle firm of Van Horn & Davis, in Utica, N. Y., has dissolved partnership, G. Fred Davis retiring from the firm.

E. L. and A. W. Pequegnat, who conducted the St. Louis Bicycle Exchange in St. Louis, Mich., have dissolved partnership, the former retiring and the latter continuing the business.

Tufts & Thayer, of Palmer, Mass., have dissolved partnership, Thayer retiring and Tufts continuing the business.

Edward Brabner has opened a bicycle store in Auburn, Mass.

J. Allen Darnaby of Lexington, Ky., has bought out the "Cyclery" at 293 Lincoln street, Chicago, and merged it into the J. Allen Darnaby Cycle Works. He will deal in tandems, bicycles and all kinds of bicycle supplies.

W. F. Beachy & Co., who conduct a cycle store and livery in Johnstown, Pa., have removed to larger quarters and added a stock of novelties.

W. F. Ferman of Tampa, Fla., has taken the agency of the Cleveland line which was formerly handled in Tampa by the Tropical Wheel company.

## GROWTH OF A REPAIR SHOP

### Expert Machinist Starts Without Money or Bicycle Experience and Builds up a Fine Trade

The excellent chance there is for a first-class mechanic with but little money to make a repair shop pay and to enlarge it, is well illustrated by a shop in a northern Illinois town of about three thousand people. The difficulties and disappointments of the repair business may be great and varied, but the actual experience of a shopman who has been successful can but show that these difficulties can be met and overcome by the right sort of mechanic who goes into the business to win.

#### Begins With Modest Equipment.

Up to 1894 the proprietor of the shop mentioned had never been engaged in any form of bicycle business. He was a first-class machinist and toolmaker and had worked in the toolrooms of such shops as watch factories and gas engine works. During the winter of '94-'95 he set up a little experimental machine shop in a spare room of his home. The outfit comprised mainly a few well selected bench tools such as had been his property while working in factories, and a small watchmaker's bench lathe that he managed to buy while working at the Elgin watch factory. A little model making carried him along during the winter and in the early spring some one suggested that there was a good chance for him to start a bicycle repair shop. Accordingly he built a small, cheap shop building about fifteen by twenty feet in size, and opened a repair shop. About bicycles he knew but little and his outfit comprised: a small assortment of machinists' tools, the watchmaker's lathe, a few appliances for making tire repairs, and a gas pipe post to hold bicycles on while work was being done on them.

#### Cycle Work Becomes Plentiful.

Along in the early part of May it began to develop that there was plenty of work in the bicycle line to be had, and as the proprietor of the shop had found that his mechanical ability was sufficient to enable him to pick up the bicycle end of the business readily, he determined to go into it a little more deeply. So a gasoline engine and an engine lathe were added to the equipment of the shop. The policy of putting in the lathe at a time when many other appliances of a more strictly bicycle nature were lacking was a doubtful one, but the shopman being a mechanic rather favored the machine tools in preference of the other necessities of a first-class shop. Lathe work came in fairly well, but bicycle work also came into the shop and proved more profitable than the machine work, and by the time that the riding season was fairly well started the shopman found it necessary to provide himself with more bicycle appliances. Nothing was purchased, however, such things as were deemed useful in the accomplishment of repairs being home constructed. By the middle of the summer the shop was equipped with as many tools and appliances as were commonly found in repair shops of that time and the repairer had come to be fairly proficient in performing the simpler repairs brought to him. There being no shops in that locality which were capable of doing a wider range of work, it was an easy matter to get custom and to hold it, 1895 being, as will be remembered, a good bicycle year from almost every trade standpoint.

Some time in August of that summer the shopman discovered while on a pur-

chasing trip to Chicago that there was money to be made with a brazer. He accordingly bought one and returned home ready to do work which no other shop at that time, within a radius of twenty miles from his town, was fixed for accomplishing. Previously to the purchasing of the brazer he had been doing as all small repairers were accustomed to do in the case of repairs that called for brazing work, that is, he had sent the jobs to the nearest large city, in this case, Chicago. A few weeks' use of the brazer developed the fact that most brazing jobs made necessary some kind of enameling afterward. The result of the discovery was the putting in of an assortment of air drying enamels. The course led to more difficulty than it did to profit, and so the repairer began to look into the baking enamel question. At this time there were few small repairers who knew anything about baking ovens or the work of applying baking enamel, so that this one was no worse off than those who had been in the business much longer. A traveling salesman from an enamel house gave him the general principles of enameling and of the construction of baking ovens. Taking the salesman's information for a basis and his own ingenuity for the other requirements the repairer built an enameling oven and started in to enamel frames. The oven was built of sheet iron and heated by a gasoline burner in much the same manner as are the small enameling ovens now on the market. The first frame enameled caused almost everything but tears, and though the workman persevered he did but little enameling work for his patrons that season. During the winter, however, when the traveling men began to come around in large numbers, a lot of useful information was collected, and this after being sorted out and what seemed to be practical put into experimental operation, led to fair success in the work. A home discovery was that for some reason or other it was impossible to keep the frames clean while working on them, and that dirt was sure to collect in the soft enamel and leave the frame specked after baking. A little study led to the conclusion that a separate room was necessary for good enameling purposes. From the time that the enameling room was boxed off in one corner of the shop the repairer began to give special attention to enameling with the result that before the next season was closed as good work was turned out of that little room as ever came from a factory. The enameling room is now an important part of that shop and any kind of fancy and decorative work is taken. The workman has yet to have his first view of the inside of any enameling room, large or small, besides his own.

#### Makes New Tools in Winter.

During the winter of '95-'96, while work was slack, much time was given to the further equipment of the shop. Numberless home-made tools were added, including a first-class polishing and buffing table and a grinder. A grinding attachment was also added to the lathe, thus making possible the accurate grinding of cups and cones after tempering. A forge was put in at little expense and during the winter months the proprietor practiced sufficiently to enable him to bend first-class handlebars by the heating process.

Early in the season of '96 the idea of building bicycles in the shop was con-

ceived, and the plan was put into limited operation. Never having worked in a bicycle factory and never having built a frame the repairer did not run the risk of going ahead before he was ready for the work, and so began to study carefully the various points concerning frame construction. The first bicycle frame built was as well aligned as though it had been erected by an old builder. The next addition to the shop was a frame vise, made desirable by the increasing business in the bicycle building line. The shop continued to run with practically this equipment till the winter of '87-'98, the only other thing added being a vulcanizer and a home-made assembling jack, the first model of which was made in the fall of '96. The jack was made with view to furnishing something on which a bicycle could be knocked down or assembled right side up, or on which some parts could be worked on without necessitating the removal of other parts. The jack was so successful that its first crude form was improved upon, and before the season of '97 had opened a commercially perfected jack was completed. The suggestion was then made to the repairer that he should market the jack, and figures on the cost of producing them in quantities were obtained from a manufacturing concern. The result was that a small lot of the stands were made and catalogues were issued and sent out. Since that time, though the inventor has not had sufficient money to properly advertise or push the stand, he has sold a fair number of them, and has the possibility of making considerable money in the near future. The stand was the result of a little careful thinking and a desire to spend all the time possible in perfecting the equipment of the shop and in such experimenting as might lead to future profit.

#### Becomes Pretentious After Four Years.

In the spring of '98 a good drill press was added to the shop, which in '97 had been rebuilt and enlarged. An office and waiting room was arranged at the front of the building, the room being nicely furnished and providing an attractive room where even the most fastidious lady customer might not feel timid about entering. The room has also been valuable in the way of keeping loafers out of the workshop room. Soon after the rebuilding of the shop a solid cabinet of drawers with a hardwood top was erected to take the place of the workbench before used. In the drawers of the cabinet all of the small tools are carefully kept, the top being always free from tools and available for the work at hand. The last home-made machine added was a handlebar bending machine on which any form of bar can be bent, the work being done cold.

The shop is now complete to do any work that can possibly be done in a repair shop, the only kind of work which is ever sent out being the nickel plating. The repair work for a section of country embracing about twenty square miles and four good sized towns is handled. Business has of course at times been dull, but all difficulties have been met in some manner or other, and the mechanic who started in business early in '95 with an outfit comprising a watchmaker's lathe and a few machinist's tools and without the slightest experience in bicycle work of any kind, now has one of the most complete repair shops in the country, is more than ordinarily well posted on bicycle construction, has a probable market for a sellable repair jack, and has never yet been inside of a bicycle factory.

Australia boasts the only regular bicycle mail service in existence. Several long mail routes are covered by wheelmen, and a special postage stamp has been issued for that service.

# THE SIGN OF SUMMER

## Business Astronomers

in searching for signs of business have discovered, with the naked eye, the brightest star of all—the Claus Bar—the prosperity star. The Claus Bar is a sign of summer—of bicycle days. It makes cycling a pleasure—a healthful exercise. People know all about it. The bicycle dealer who tells them something else will do will lose their trade. That's all.

The Claus Handle Bar Mfg. Co.

• • • Milwaukee

## The Claus Handle Bar

moves in an orbit of its own. No other bar can be adjusted without a wrench. No other bar retains its width at all adjustments. No other bar is guaranteed forever. It is the only bar in which all parts interlock. And the only bar the people want. May we quote you prices?

## RECENT PATENTS

## Toggle Action Driving Mechanism — Bottom Bracket Pressed in Two Parts—Tricycle Frame

**Nordell's Bicycle.**—The reciprocating lever driving mechanism of which a plan view partly in section is shown has the rear wheel and axle mounted upon ball bearings in the fork ends by means of cone-bearing collars keyed to rotate with the axle. Each collar carries a crank, the end of which is journaled to a lever, which at its forward end carries a pedal. The pedal end is not free, however, but is journaled to form a toggle-joint, together with a crank which is fixed upon a shaft,

whose position corresponds to that of the crank hanger shaft in an ordinary bicycle. This shaft is in two pieces connected by bevel gear pinions in the manner usually employed for obtaining reciprocating action. The motion of the pedals, it will be noticed, is in an arc of a circle, the concave side of which is to the front—a somewhat unusual motion—and the lateral bending stresses to be borne by the rear forks, when the rider would bear down with his entire weight on one pedal as for example by dismounting, must be very great, the action being very similar to that produced on an ordinary bicycle by grasping the upper and lower reaches of the sprocket chain and pressing them toward each other. In order to secure speed the inventor proposes the use of a large driving wheel and a multiplying-gear between the pedal lever and the rear wheel. The patentee is Carl Nordell of Stamford, Conn.

**Pneumatic Brake.**—An air cylinder is fastened to the lower portion of the seat mast. Within the cylinder is a piston connected to the driving mechanism of the bicycle by a piston rod, which is pro-

vided with a stuffing box. The connection may be that of an eccentric and strap of the usual order, operating on the crank shaft. Two tubes communicate with the cylinder, one at each side of the piston, leading to a valve casing attached to the handlebar or elsewhere, within easy reach of the rider. The valve casing contains two valves which are adapted to be moved together and thereby simultaneously open or close the tubes and confine or release the air on both sides of the piston. In the illustration is shown a graduated valveport, which will

enable the rider to slowly or partially close the valves so as to obtain a moderated brake effect as when descending long grades. If the valve is closed and remains closed, the air at one end of the cylinder will be compressed, while that at the other end will be expanded, and when the reverse stroke takes place the air previously compressed will be expanded with equal force less the energy lost by radiation of heat in compressing, and that portion of air previously expanded will be compressed. This order of events will not add materially to braking effort upon the motion of the machine; but when the rider, keeping time with the right-and-left pedal movement, closes the valve as the pedal moves down and opens it as it reaches its bottom position for a moment to let in free air and allow the compressed air to escape and immediately close it again, a new condition will be present which will give as much retardation as the original movement. The inventor is Charles Sears of Cleveland.

**Frame Stampings.**—The illustration shows the construction of a bottom bracket with frame lugs and stub for attachment of a rear fork crown. The bracket is formed in two symmetrical halves held together by an inner sleeve with beads for limiting the insertion of

ball cups. The claim is for a "bicycle frame having a cross-head (bottom bracket) and a stub proceeding rearward from it, said cross-head and stub being formed of two parts so shaped that the seams of the stub will lie in a plane, which is transverse to the crosshead, and a fork having a crown-piece provided with a stem, which telescopes with the stub of the cross-head, said crown-head and its stem being formed of two parts so shaped that the seams of the stem and the stub will break joints." The patentee is Lee Sturges of the Chicago Stamping company.

**Tricycle and Carrier.**—It is the object of this invention to provide a tricycle of a simple, inexpensive, and strong, construction, adapted, by reason of the flexibility of those portions of the frame in which the driving wheels are mounted, to run more smoothly and easily than tricycles as heretofore constructed. The two rear driving wheels are journaled in the frame so as to revolve each independently of the other and each adjusted to have vertical movement independent of the other. There are consequently two sprocket wheels on the crank shaft, one on each side, and from these motion is ordinarily imparted to the rear wheels concurrently. In the operation of the machine, however, as is manifest, when the vehicle follows a curved instead of a straight course, as in turning a corner, the outer driving wheel will be caused to

travel a greater distance in the same time than the inner wheel, and obviously if the ordinary solid sprocket wheels were employed this would cause the grinding or scraping of the tires upon the ground.

For this reason two-part front sprocket wheels are employed, on which the sprocket rim is allowed to slide on the spider to a certain extent determined by a projection which limits the movement. As the arrangement is described by the patentee the work of propulsion while turning a curve is thrown upon the inner wheel, and this will make a short turn difficult, if the tricycle carries a heavy load as seems to be a contingency kept in view by the inventor. The use of motor

power for propulsion of this style of tricycle is also among the possibilities considered in the claims. The two rear forks are connected by a flexible or spring device with the seat mast and the independent vertical movement thereby given to each wheel when either of them passes over an obstruction, is guided by lugs and guide plates which also serve to keep the wheels a given distance apart laterally. The inventor is H. F. Watson of Philadelphia, assignor in part to W. J. Channel of the same place. Patent No. 615,054, November 29, 1898.

**Holloway's Coasters.**—This is a brake and coaster foot-rest combined which may be attached to any ordinary bicycle, and the brake can be applied by a downward move of the heel of the rider while the toe is on the foot-rest. Referring to the illustration the attachment and operation of the device is described as follows: The screws 7 are removed and the toe-rest 3 and a plate 4 put on either side

of the bicycle-fork, and the screws are then replaced and the rest is clamped to the fork by tightening the screws 7, the brake extending toward the rear of the wheel. The springs 5 will then raise the brake up and the point 9 on the brake 8 will strike the screw 7 and prevent the brake from being raised too high. When it is necessary to put the brake on, the rider places the toe on the rest 3 and the heel on the rest 11 and bears down with the heel, thus pressing the spool 14 on

## A RADICAL CHANGE

**A. G. Spalding & Bros. Inaugurate  
a New System of Conducting  
Their Business.**

### SELLING TO RETAILERS DIRECT

**The Object of the New Policy Is to  
Prevent Price-Cutting.**

### BOUND TO BE A SUCCESS.

**Reasons Which Induced the Firm to  
Make This Change.**

A. G. Spalding & Bros., the largest dealers in the world in the sporting goods line, have adopted a change in their business methods and will hereafter sell to retailers direct. A copy of their plan is given herewith:

NEW YORK AND CHICAGO,  
December 1, 1898.

We desire to call the special attention of the trade to a radical change that we have decided to adopt in the method of distribution of Spalding's Trade Marked Base Ball, Athletic and Sporting Goods.

Since the establishment of our business in 1876, the larger part of our athletic product has been sold through jobbers; but after Jan. 1, 1899, our goods can only be obtained directly from us, and all athletic implements manufactured by us and bearing our name will be sold at only one price to the trade and at one price to the consumer.

#### OUR REASONS.

In these days of close competition in all lines of trade, the questions that claim the consideration of all successful manufacturers are numerous.

The first, and most important is: *How to reach the consumer with the smallest cost of distribution.*

The second, and almost equally important is: *How to insure a fair profit to the retail dealer.*

The third, and vitally important one, when taken into consideration with the other problems is: *How to prevent unfair, demoralizing, "price cutters" from securing a quantity of well-known and largely advertised articles and offering same as "leaders," at about cost, or in many cases less than cost—all of which tends to degrade the quality of goods and ruin the small and legitimate retail dealer, who is entitled to a fair living profit.*

#### HOW WE SHALL DO IT.

After most careful thought and consideration we have answered these questions to our satisfaction in the following manner, and we have decided to conduct our business in future on the following lines:

#### SELL TO RETAILERS DIRECT.

We shall aim to reach the consumer through the medium of the responsible and legitimate retail dealer, to whom we shall go direct with our complete line of Trade Marked Athletic goods and other specialties that we manufacture and control. By doing away with the intermediate jobbers' profit, we are enabled to and will give a uniform net trade price on each article to any responsible and legitimate dealer carrying a stock of these goods—the same to large and small, regardless of quantity.

#### ONE PRICE EVERYWHERE.

As a condition of purchase by the retail dealer of our Trade Marked Athletic Goods, or other specified articles that we control, we shall insist that such goods be sold at a uniform retail price throughout the United States, fixed by us—no more and no less.

#### NO CUTTING OF PRICES.

We shall aim to prevent any unusually large purchases or an accumulation of stock by any price-cutting dealer, thus reducing to the minimum the opportunity of any such dealer continuing a sale of our goods at a cut price. We shall positively refuse to sell any dealer, directly or indirectly, large or small, who persists in cutting prices on any of our Trade Marked Goods.

#### NO INTERMEDIATE PROFITS.

In carrying out this new method of distribution, it becomes absolutely necessary to discontinue supplying our Trade Marked Goods to jobbers for jobbing purposes; for in order to carry out the general plan outlined above, we must control the source from which the dealer draws his supply, thus preventing "price cutters" from obtaining our Trade Marked Goods from a friendly jobber that cannot be obtained directly from us. This has been the trouble this season in several notable instances of price cutting.

#### HIGHEST QUALITY GOODS AT LOWEST PRICES.

It shall be our aim to furnish the public, at regular established prices, with standard goods of a grade or quality commensurate with the price. Our factory facilities are immeasurably greater than those of any other house in our line in the world. We now manufacture in our own factories, operated by ourselves, nearly everything bearing our name, which enables us to maintain the highest quality and at the same time furnish the goods at the lowest possible rates. The reputation of our goods for quality, which has been made in nearly a quarter of a century of successful business, has not been a thing of chance, but has only been acquired by manufacturing with the utmost care and giving to the public, Athletic Goods of the very best grade that could be manufactured.

#### A SURE AND STEADY PROFIT.

Our plan provides a fair and reasonable profit to the retail dealer on all our goods; a profit that will be satisfactory and amply sufficient for any business economically conducted. Dealers who are in search of "job lots" and profits of 100 to 200 per cent must look elsewhere. They cannot get it out of our goods, but they can make a fair, reasonable and sure profit and give the public the very best goods, with our guarantee behind each article.

#### AT FIXED PRICES.

There will be no "jockeying" allowed in quality any more than in price, and we think

the public in this age of circus advertising and "bargain days" will welcome the change to standard goods of absolutely fixed prices, in which their interest not only commences with the purchase, but continues by a liberal guarantee of the manufacturer, both as to quality of material and workmanship.

#### SUCCESS ASSURED.

We feel confident that this radical change in merchandising will be popular with the reputable and responsible retail dealers in Athletic Goods, in whose interest it is largely made, and with their support and co-operation we are confident of its success. We know it will be popular with the public, who will be getting the best goods for the money that have ever been made, and will be able to procure our Trade Marked line of goods cheaper than ever before.

#### PARADOXICAL BUT TRUE.

Athletic goods are made to abuse—not use. The batter tries to tear the cover off the ball every time he hits it; the golfer uses his club as a battering ram; and foot ball—well, we all know what a parlor amusement that is.

Under all these circumstances will it not pay you to sell the best, and cannot you satisfy your customers and hold your trade better by doing it?

#### THE SPALDING POLICY.

Every article bearing the Spalding Trade Mark carries with it not only our guarantee of quality, but also a confidence to a most critical clientage that it will satisfactorily serve the purpose for which it is intended. We will not call an article wool when there is cotton in it, nor will we use ingredients or material simply calculated to reduce the price at the expense of quality.

#### FOR QUARTER CENTURY.

And this policy consistently carried out for nearly a quarter of a century has given SPALDING'S TRADE MARKED ATHLETIC GOODS a standing and reputation that makes it possible to successfully carry into effect the general plan outlined above.

#### WE WANT YOUR NAME.

We would respectfully request such merchants as may be interested in this particular line of business to write to us, that we may place their names among our list of customers. This will insure their getting, without further request, all catalogue matter as soon as published, also notice of any change in prices, of new goods, and other information that may prove mutually beneficial.

#### FOR OUR CATALOGUE.

Early in January we shall issue our complete catalogue with revised prices, and we shall aim to have our *Confidential Net Trade Price Lists* fall only into the hands of legitimate retail merchants carrying a stock of Base Ball, Athletic and Sporting Goods.

#### WILL YOU HELP US?

We respectfully ask the co-operation of all responsible and legitimate retail dealers in athletic goods throughout the United States, confidentially believing that by such co-operation the athletic goods business can be rescued from the present unprofitable and demoralized condition into which it has been placed by unfair and unbusinesslike methods of certain price-cutting dealers and quality-destroying manufacturers.

Respectfully,

A. G. SPALDING & BROS.,  
NEW YORK AND CHICAGO.

the bicycle-tire until the desired friction is secured. The inventor is W. H. Holloway of Brazil, Ind.

**Bevel-gear Train.**—The object of the construction is to provide a practical chainless power transmission for bicycles in such a manner that narrow tread may be obtained with gearing closely resembling straight-faced cam wheels. To this end slightly beveled gear on the crankshaft faces outwardly and the slightly beveled gear on the rear wheel hub faces inwardly, making the bevels of the two wheels parallel. Between them is arranged an annular gear, which may be made to revolve either upon three rollers

as shown in the illustration or on a stud-shaft. In either case some special form of motion or journaling must be provided for it, but on this point the patentee is silent. The claim is for "The combination of a bicycle frame, the driving-wheel, the crank-shaft, the bevel-gear union, and the bevel crank-shaft gear, having their greatest diameters at opposite sides of the intermediate gear, and the intermediate gear set at an angle with the planes of the crank-shaft gear and the pinion." In the illustration the angular relations of the three gear wheels is shown in a plan view. The inventor is Walter E. Taft of Providence, R. I., assignor to the Universal Mfg. company of Maine.

F. H. Murphy and M. R. Pierce of New York city have patented a change-gear mechanism for bevel-gear bicycles, by which a worm, rotated by means of a jointed rod extends through the lower frame tube to the upper end of the steering head, drives a lever which engages a clutch splined on the driving shaft. The clutch according to its position on the shaft engages one or another of two pinions on the shaft, or when midway between them leaves them both to revolve as idlers. The main driving gear has, of course, two concentric bevel-gear faces of which the larger one produces high speed.

Patents have been granted under date of November 29, 1898, to William H. Fauber of Chicago, for a lathe especially designed for turning crank axles in one piece with the cranks. The lathe comprised a peripherally supported and actuated chuck having central chuck-jaws and tool-carrying plates located adjacent to the side faces of the chuck and movable in a direction at right angles to its axis of rotation. The patent is No. 614,853.

W. E. Gerow of Newburg, N. Y. has patented a toe-clip with an adjustable counter-weight to hold the clip in position to receive the foot of the rider. No. 614,856, November 29, 1898.

#### Mixture for Waterproofing Tires.

For waterproofing fabric tires, a writer in India Rubber World recommends the following process: Pound together in a mortar 12.4 ounces potash alum and 11.81 ounces acetate of lead until they are liquescent; then add 7.18 ounces of bichromate of potash and 7.18 ounces of glauber's salt (sodium sulphate); continue pounding and add 4.23 ounces of calcined magnesia and 1.32 gallons of water. When the mixture is well pre-

pared, it is poured into 13.2 gallons of water and stirred for twenty minutes, which effects a thorough dissolution of the solid substances. Dissolve in another utensil 5.28 ounces tannin, 1.76 ounces gelatine, 3.52 ounces yellow resin, and 13.2 gallons of rainwater; add 26.4 gallons of common water and stir well; pour into this the first mixture and brew the whole twenty minutes. Immerse the tires in this liquid, which should be constantly stirred until they are impregnated in the solution.

#### NEAT DRESS GUARD SCHEME

Protective Appliance for Diamond Frames Ridden by Women—Adds a Touch of Femininity.

A novel scheme for fitting dress guards to ladies' diamond frame bicycles and to lady-back tandems is that shown in the accompanying illustration. The prime need in a rear wheel dress guard is not to supply a mud guard, but to furnish a protection against the catching of the skirt of the rider in the rear wheel. It has been the common practice to put on short guards of the old circular mud guard type, which had side laces running to clips at or near the rear end of the frame. These guards kept the skirt from catching in the spokes of the wheel, but since the short riding skirt has become popular such guards have not offered sufficient protection against the lower end of the skirt being carried through the rear stays above the rear wheel and becoming entangled in the wheel and frame directly back of the seat mast and above the wheel. The guard in the illustration has been devised as a means of preventing the short skirt from being blown or carried between the rear stays at or near the upper side of the wheel. It consists

of a flat piece of mild steel, about one-eighth by three-eighths inch in size, bent into a long parallel-sided loop and also bent to conform to the circumferential curve of the rear wheel. The loop is drilled at regular intervals along its sides for the reception of the lacing cords, and is fastened to the frame in the manner illustrated, by small clamps binding around the rear stays. Instead of lacing to the rear end of the frame the cords run upward to some kind of a clip fastened on the seat cluster. The guard thus furnishes a dress protection above the rear wheel, where it is needed for short skirts. The metal loop being well made and nickel plated and the lacing being neatly and securely executed, the guard will appear neat and not at all clumsy. The side bars of the metal loop may be run either inside or outside of the frame stay tubes, according to the distance between the latter. If run between as shown at A, in the illustration, the joints formed by the union of the ends of the piece of bar metal may be brazed together and a flush invisible finish obtained. If the distance between the stays makes necessary the placing of the guard outside of the stay tubes the ends of the piece must be lapped, drilled and bolted or screwed together as shown at B. In either case ordinary mud guard clamping clips may be used to clamp the guard to the frame.

The guard has never been marketed and has as yet been used only in a few instances, but the satisfaction thus far obtained from its use would warrant its wider adoption. Not the least of its advantages may be found in the distinctive

mark of femininity by which it tones down the somewhat bold effect of a diamond frame in the hands of the gentler sex.

#### The Bicycle Saves Nickels.

The report of the Manhattan elevated railroad of New York city for the year ending September 30 has just been made public and shows the loss of more than 10,000 passengers a day as compared with the preceding year. From 1880, when the road was opened, the number of passengers carried steadily increased from 80,000,000 to 221,000,000 in 1893. Since then there has been an annual decrease, and last year only 179,000,000 were carried, notwithstanding the acquisition of a branch line, and the receipts have fallen off \$2,000,000. To what extent the bicycle is responsible for this does not seem to be known.

#### English Houses Prosper.

Reports from English manufacturing concerns still continue to arrive, and sustain the belief that the cycle industry over the water is in competent hands. Following are the late reports:

(a) Singer Cycle Co. .... \$135,265  
 (b) Lloyd's Cycle Fittings, Ltd ..... 10,720  
 (c) Swift Cycle Co. .... 169,725  
 (a) A dividend of 4 per cent was declared on ordinary shares and 5½ per cent on preferred shares. A balance of \$52,825 was carried forward.  
 (b) No dividend was paid on common stock.  
 (c) A dividend of 4 per cent was declared on common stock and 6½ per cent on preferred stock. The sum of \$25,000 was placed to reserve. The reserve fund now amounts to \$177,725.

#### Receiver for Punnett Co. Sued.

Anna E. Delp and John A. Bell of Pittsburg, have brought suit against Frank J. Hone as receiver of the Punnett Bicycle company of Rochester, N. Y., which failed about eighteen months ago, to recover \$1,400 as restitution for twenty-two Champion bicycles alleged to have been purchased of the Punnett company and ordered stored. When the company assigned the receiver levied on the machines. Defendant has entered a general denial.

#### Sol Heyman Co. Assigns.

The Sol Heyman company, dealers in furniture, carpets, household goods and bicycles, at 993 Third avenue, New York city, has made an assignment to Isaac Blumenthal, following the assignment of George Heyman, his brother, with whom he had exchanged paper. The liabilities are about \$50,000 and the assets are said to exceed that amount. It is expected that the business will be continued.

#### Austrian Manufacture Increasing.

In Austria the manufacture of bicycles is making rapid progress. The lowest estimate of the 1897 output is 70,000 machines, which is nearly double the number produced in 1896. Exports increased from 5,735 bicycles in 1896 to 8,690 in 1897, or 68 per cent, while the production increased 66 2-3 per cent (28,000 bicycles more than in 1896) and imports 37 2-3 per cent (815 bicycles).

Vance Prather, a well known Toledo newspaper man and a correspondent for cycle journals, is not dead, as was reported. He enlisted to go to the Philippines and word came that he had died at Honolulu. Prather took occasion to denounce the story as a pure fabrication, upon his return a few days ago. He has suffered from typhoid fever.

One who retains a note, or its proceeds, obtained by his agent by fraudulent representations is bound thereby, although he did not know, and had not authorized such representations.

## ONE WINTON MOTOR VEHICLE

### SPEED REGULATED IN TWO WAYS

#### Gear Speeds Supplemented By Governor Which Graduates the Fuel Supply—Strong Driving.

The Winton motor vehicle company, of Cleveland, has adopted a policy of reticence in regard to details of their work.

The following information is therefore obtained through Dr. Zabriskie, who has purchased one of the Winton vehicles

This wagon was patented May 4, 1897, February 15, 1898, March 15, 1898, and two other patents were issued September 6, 1898. The principal features of novelty in the Winton wagon are connected with the fuel consumption regulation, which is under control of a governor operated by the driver's foot. This governor increases or diminishes the volume of explosive compound furnished to the cylinder for a working stroke, the composition of the explosive mixture remaining always the same. The operation of this governor alone is to produce a slow speed by a reduction of the power of the engine, or a high speed by increasing the power of the engine. This procedure does not fill the operating requirements of the motorcycle, which, in very frequently occurring cases, demand that the speed shall be reduced, while the engine works at its maximum power. The speed changing possibilities of the governor are therefore supplemented by systems of direct mechanical changes, which give two speeds forward and one speed backward, the governor being used to vary these gear

Winton Gasoline Motor Carriage.

speeds. Dr. Zabriskie finds the governor very useful, as it is far easier to change the speed of the wagon by pressing the governor treadle with the foot, than by changing the speed gear clutches through the operation of a hand lever.

#### The Exhaust Effectually Muffled.

The Winton wagon motor has a single cylinder, resembling the Benz wagon in this respect, and carries a heavy flywheel. Dr. Zabriskie's wagon can make about 18 miles per hour, and the fuel consumption per hour is about one gallon of store gasoline, 74 degrees, at 10 cents per gallon. As the exhaust is at the rear of the vehicle, the odors produced by imperfect combustion are not offensive to the passengers themselves. The exhaust is quiet, an effective muffler being introduced. The framing is substantial, and the motor drives the wagon strongly. The writer rode with Dr. Zabriskie for a considerable distance over muddy dirt roads in the wilds south of Flatbush, Brooklyn, and the carriage was under easy control at all times, with an abundance of power.

The ignition is electric, from a wet battery; Dr. Zabriskie informed me that the Winton shop was perfecting a dynamo, driven by the engine, for producing the igniting spark.

#### The Oiling Problem Important.

The writer was present when Dr. Zabriskie prepared the wagon to go out in the morning, and the operation of oiling was the subject of unfavorable comment by its owner, as he was obliged to use special gloves and a special outer garment for protection against machine grease. Some of the explosion engine driven vehicles lubricate in bulk, with a sight-feed, from which pipes lead to every point where oil is needed. Such an oiling system could be readily applied to the Winton or any other motorcycle, and attention to all points looking

Rear View—Tailboard Down.

toward clean hands and clean garments of drivers, must be regarded as a strong favorable feature in motorcycle designing.

The wheels of this Winton wagon are wire spoke suspension, 32 and 36-inch diameter, with steel rims and 3-inch pneumatic tires. The steel rims showed signs of failure by crumpling, similarly as the steel rims of the New York Cab wheels. The total weight of this wagon is 1,400 lbs., and the price is \$1,000.

The owner expressed himself as very much pleased with it, as it carries him any distance he wishes over suburban roads just now being opened, and alternating in surface between the natural soil, fresh turned earth, mud, and newly laid broken stone—about as trying a combination as can be conceived.

Dr. Zabriskie says that a number of Winton wagons, he thought 23, had been sold, mainly in Pennsylvania, all of which were giving excellent satisfaction. The appearance of the vehicle is well shown in the engravings presented herewith.—Hugh Dolnav.

#### Tried to "Make Sense."

In "The Whitney Wagon Steering Lever," p. 107 of the Cycle Age of Nov. 24, the word "spliced" is twice used in place of "splined."

Mechanical readers and writers well know the deadly propensity of the intelligent compositor to "make sense" of the slipshod writer's work—to the intelligent compositor all writers are a careless, foolish lot—by changing a few letters or figures here and there. Whitney's grip rod is "splined" to the throttle crank, not "spliced" thereto.

#### Start of Gas Engine Vehicles.

It is noticed that explosion motor carriage makers construct their starting mechanism in such form that the driver must stand on the ground when starting the engine to work. But there seems to be no good reason why this could not be done just as well after the driver has taken his seat in the carriage.

## HOW MANY CYLINDERS WANTED

### PLEA FOR THE PLURAL SYSTEM

#### To Produce a Constant Torque and Dispense With Heavy Fly Wheel and Cooling Jackets.

Motocycle explosion engines have been made with one, two, three, four and five cylinders. What is the proper number?

If a wagon is driven with a single cylinder, say 5 to 5½-inch bore, the piston and rod are pretty heavy, and are quite likely to cause an objectionable vibration of the vehicle body. A cylinder of this diameter is not safe without a water jacket, and this implies a large supply of cold water.

As this single cylinder, ottocycle, is idle three-fourths of the time, a very heavy fly wheel is needful, and even with the heavy fly wheel the wagon is not likely to be a good hill-climber.

#### Vibration Obviated—Weight Reduced.

With two cylinders the case is much better; the cylinders are smaller bore, and the pistons can be made to balance each other and so obviate vibration, and the fly wheel can be much lighter than where only one cylinder is employed.

With three cylinders the conditions are still more favorable; the cylinders are still smaller, the torque is much nearer constant, the fly wheel can be again reduced, and the whole mechanism is much improved.

There is another point greatly in favor of a smaller cylinder. Up to 3½-inch bore or a little more vertical explosion engine cylinders, splash lubrication, can be operated perfectly well without the water jacket. A 3½-inch engine is to a 5½-inch engine as 12¼ is to 30¼; hence three cylinders, 3½-inch bore, would do as much work as a single 5½-inch bore cylinders, piston speed equal, while the little cylinders would not need cooling water.

The same conditions apply with the four-cylinder ottocycle explosion motor, which gives the same torque as a single cylinder double action steam engine.

#### Manufacture by Automatic Methods.

Going one step farther, and using five cylinders, no flywheel, or at most a very small flywheel only, is needed, and the engines are perfectly safe with splash lubrication only, without water jackets. Say these five cylinders are each of 2½-inch diameter, which would be roughly equivalent to a single 5½-inch cylinder. These five little cylinders come easily into the scope of manufacture by automatic and semi-automatic machine tools, and hence could be finished for about the same cost as the single large cylinder engine. A single casing would enclose all the working parts of the engines, the splash lubricator would be perfect, and the small cylinders, which need not be more than 1-10 of an inch thick, can be sufficiently cooled by radiation, without the use of water.

Once more, if a small flywheel is used with five cylinders, say a flywheel of not more than 15 or 20 lbs., such connections can be easily made as will permit the driver to start only one of these little cylinders, and that one will start the others in work.

All of this is unquestionably feasible, and would give a fairly constant torque, and would reduce the vehicle weight say 200 lbs., in the way of flywheel and cooling water tank, and would cost less money for machine work, in a well fitted establishment, than less cylinders of larger diameter. Vibration would be impossible, light wheels and cheap tires could be used, and many of the advan-

tages of a steam motor would be gained, and the always objectionable steam boiler and its feed water would be absent.—Hugh Dolnav.

[Granting the special advantages of a plurality of cylinders as set forth in the above article, it yet seems apparent that the vehicle constructed in the manner suggested would be at a disadvantage in those numerous instances when a single powerful impulse is momentarily required, in order to get out of a rut in a road, "backing out" under difficulties, and on similar occasions. The opinions of motor vehicle engineers on this point would be of interest.—Ed.]

#### Origin of Standard Valve Threads.

As an example of how chance and circumstances sometimes count for as much in mechanics as forethought, is the standard thread now used in all tire valves for the attachment of the inflating pump. Away back in the early days of the pneumatic, when Morgan & Wright first began to make such tires, one of the firm went over to the establishment of G. M. Davis & Co., makers of steam specialties and valves, and asked them to make some kind of a tire valve. There being no data on the subject from which to get proper sizes, etc., a skirmish was made through the tools of the Davis company for something which would be suitable for the making of such valves. Among other things found was an old tap that had been some time before made for special work and which had been thrown away after use among the old tools. The tap was of no regular size or thread, but seemed to be about the right thing, and so was used to tap out the valve for the attachment of the pump. As everybody knows the old Morgan & Wright thread proved so satisfactory that it has now become the standard, and anybody who makes valves uses a tap of thread and size which is not only out of the ordinary run of tap sizes, but which was originally selected by the merest chance and without any attempt to logically discover the best size for the purpose.

#### The French Cycle Trade.

It is estimated that about 200,000 bicycles are sold annually in France, the greater part being of domestic production. Some of these are imported from Germany, England, and the United States, but the sum total is not large. It is hardly worth while to send over any but the best class of American bicycles, nor is it well to sell machines without first having made arrangements to have them taken care of. The cyclist who buys a bicycle for which he cannot readily buy parts in event of an accident to it will help to injure the trade in American wheels thereafter, no matter how cheaply the machine may have been bought at the beginning. Any tires imported from England are, of course, Dunlops, but the tires most widely in use in Germany are of the clincher type, such, for instance, as the Continental tire, made by the large rubber company of that name in Hanover.

#### Hardware Dealer Wants Catalogues.

S. F. Shoemaker, dealer in hardware at Dalton, Pa., expects to put in a full line of bicycle goods for the season of 1899, and would be pleased to receive copies of catalogues, price lists, etc., relating thereto.

In the last sixteen months the wages of the average cycle workman in the English factories did not exceed \$5 a week, chain makers excepted. In the factories here the average of wages is about \$10 a week.

## GOOD PARA RUBBER IS SCARCE

### NATIVE TREATMENT OF GUM

The Area is Vast But the Supply is Limited—Scarcity of Labor Keeps Prices Up.

The condition of the rubber market is one of exceptional activity, marked by daily and even hourly fluctuations. It is impossible to calculate in advance the extent of the Para rubber crop, though, judging from the present outlook, there will probably be a very large increase over that of last year. It is certain that the rubber-producing area in the Para section of the Amazon, recently discovered and untouched, is hundreds of times larger than that now being worked. The price of crude rubber is fixed in the foreign markets, especially New York and London. The buyer, stationed in Para, carefully watches the market, and calculates his price in accordance with quotations received from those cities.

The upper and lower districts of the Amazon produce the same kind of rubber, but that coming from the upper river obtains a slightly higher price, being drier by the time it reaches the port of shipment.

#### Limited Supply of Para Gum.

During the fiscal year 1897-98 there was received in Para 22,257 tons of rubber, and of this amount 11,422 tons were shipped to the United States and 10,796 to Europe. The state of Para does not produce more than two-thirds of the rubber shipped through the port of Para, the balance coming from the state of Amazonas, as well as from Peru, Bolivia, etc. The city of Para is a convenient shipping point on account of its telegraphic and banking facilities.

There are three grades of Para rubber—fine, medium and coarse. If rubber is not uniform and contains impurities, it is classified as medium. The coarse quality, or "Sernamby," consists of scraps that have not been cured.

#### Why Rubber Gatherers Are Scarce.

Insufficient labor is the most serious difficulty in the rubber industry. It would scarcely seem advisable to invest money in rubber estates, unless the owner first can see his way clear to obtain sufficient labor with which to collect the rubber. In reality, the genuine owner of the produce of the forest is the collector, not the landowner. Out of 100 employes, whose outfit and traveling expenses have been advanced, at least 75 die, desert, or return to their homes on account of illness. As a rule, the landowner makes advances to the collectors for their outfit, food, etc., and in return receives the rubber collected by them. He sells the produce on the collector's account, retaining 20 per cent for himself, and continues making advances in such manner that the collector always remains in his debt and consequently in his service. It frequently happens, however, that the collector takes the advance and fraudulently disposes of the rubber to any buyer who may be on hand. One of the methods in practice is to lease the trees in lots of 75, 150, or 200, at a given sum per annum, and to stipulate that the lessee shall sell the rubber and purchase all his supplies from the owner.

#### Enormous Area of Production.

The localities where rubber trees thrive best are on islands and low ground near rivers, where the banks are periodically inundated. Ground that is above water at all times, or that has no drainage, is not suitable. The peculiarity of this rubber tree is that it will not grow satisfactorily on cleared or opened ground. It

requires the shade of other trees and still air from the time that its growth begins until it becomes an adult tree. Without these conditions the supply of milk is very much affected. In fact, the tree has been known to die soon after the clearing of ground around it. No cultivation worth mentioning has been attempted in the region of the Amazon. It is considered useless to invest capital in cultivation so long as the Amazonian forests show no signs of exhaustion. The area that is known to produce Para rubber amounts to at least 1,500,000 square miles. Further exploration will no doubt show that this area is far underestimated. On the River Aquiry 200 trees yield as much as three tons of rubber per annum.

#### Life in the Forest.

The collector has to use a knife with a 26-inch blade to cut his way through the undergrowth, and also cut down a sapling, occasionally, to bridge a rivulet. At times he is knee-deep in ooze, or up to his waste in water. On arrival at a rubber tree, he chips away the rough parts of the bark, makes a more or less smooth surface, attaches a cup, and makes a small gash for the sap to fall into the cup, and repeats this process in a line round the tree until he has attached six or seven cups. The cups are of clay or tin. The former are attached to the bark by means of a little clay. Their weight, however, makes them inconvenient to carry when the trees to be tapped are separated by long intervals; the collector then prefers to carry tin cups, which are much lighter than the others. They easily penetrate into the bark by means of their sharp edges, and hold to the tree without the use of clay. The use of the tin cup is to some extent injurious to the tree.

The collector continues this process until he has tapped from 75 to 150 trees, which can be done in a day if they are not too far apart. On the following days the gashes in the trees are made a trifle lower down than the first ones. Some collectors tap the trees in the morning and return to collect the sap in the evening, whereas others tap in the evening and collect in the morning. An expert gathers 7 pounds daily in the Lower Amazon; in the Upper Amazon three times this amount is collected.

#### A Popular Mistake.

It was at one time imagined that the excellence of Para rubber was greatly due to the kind of fuel used in curing it. The palms that furnish the fuel were accordingly transplanted to Africa, with a view to making Para rubber there. The experiment, however, has not met with success. The reason these nuts are selected in Brazil is because they emit a continuous dense smoke, and are more portable than other fuel obtainable.

When the accumulation of rubber is sufficient—usually in three or four days—the collector lights a fire in the hut he has erected, places a clay funnel over a fire, pours in a thin coat of sap over the paddle mold, and holds it over the smoke to coagulate. The process is repeated until a large cake has been formed. To release the paddle from the cake, it is necessary to make a slit on one side. The paddle mold makes a cake of uniform and even shape, and is in general use in the state of Para. In other parts a spit is placed on two upright forked sticks, and given a rotary motion. By this means, the rubber is cured with greater ease. Paddle-smoked rubber is decidedly preferred, as it is drier and seemingly more carefully cured. Many vain attempts have been made to introduce improved curing methods.

The process of curing rubber is extremely injurious to the eyes. Many cases of total blindness result therefrom.

MANSON, MODEL 33, 3-CROWN—LIST PRICE, \$50.

MANSON, MODEL 32, 2-CROWN—LIST, \$40.

MANSON, MODEL 31—LIST \$30.

**We want to put you in on the ground floor to handle a Bicycle with not even one single "black mark" against it.**

The originators of the 3-Crown Manson offer you for '99 a line of 3 grades— from the very best built with the very finest finish down to an honest built bicycle at a low price. We do not employ travelers (can't afford it), but to all first-class agents in unoccupied territory who want a line of wheels which are competition proof and who can pay for them, we will quote liberal discounts and back them up by a guarantee in which we agree to pay express charges both ways on defective parts. # INFORMATION FOR BUYERS

## THE BRILLIANT GAS LAMP.

An acetylene gas lamp that embodies a number of new and valuable features is the Brilliant, made by the Manhattan Brass Co., whose factory and general offices are at 333 East Twenty-eighth street, New York city. This concern is well known as the producer of the Frontlight, Cyclops, Queen and other oil lamps familiar to the trade, and is well qualified to offer a perfectly satisfactory gas lamp to the trade through years of experience gained in the manufacture of all kinds of lamps, including acetylene bicycle lamps made under contract. The general form and construction of the Brilliant gas lamp is

shown in the perspective drawing herewith. It is perfectly simple in every detail, and there are no delicate parts to get out of order. All parts, however, are interchangeable and can be replaced. The water reservoir is connected with the ventilated burner box only by a small metallic support for the latter, so that a minimum of heat is conducted to the water. The burner is of the two-jet type producing a fish-tail flame of constant size, which neither flares up through the top of the chimney nor jars out. The reflector is of aluminum, from which tarnish is easily removed with a cloth. Loose carbide or standard cartridges of powdered carbide can be used, the gas chamber having a metallic telescoping carbide cylinder, shown in the sectional drawing, for use with lump or granulated carbide. The top of this is closed by two perforated plates between which are placed several layers of muslin to act as filters for the gas as fast as it is generated. The gas, rising, impinges against the base of the water reservoir, where the moisture in it is condensed by the cold so that the gas passes to the burner in a dry state free from the usual impurities. Instead of feeding the water to the carbide through a tube, it is allowed to come out of two lateral holes and flow down two grooves in a metal needle pendant from the center of the water chamber and which fits within a perforated and muslin lined tube in the carbide cylin-

der. A little handle at the top of the lamp governs the water feed valve. The head of this is provided with a series of notches engaged by a spring clip that holds the valve handle at any position to which it is set. Perhaps the best feature, however, is the method of closing the carbide chamber so as to prevent the leakage of gas. This is accomplished by making the bottom of two parts—a screw threaded ring flanged underneath, and a metal disk fitting within this. A thick rubber cushion of just sufficient diameter to cover the edge of the gas chamber is placed upon this disk, and when the ring is screwed up until the rubber contacts with the circular edge of the lamp base it and the plate it rests on cease to

turn with the ring, whose flange nevertheless slides freely against the metal plate and squeezes the rubber firmly between the plate and gas chamber edge, making an airtight joint. Thus there is no friction to wear the rubber and a tighter joint can be more easily made than where the rubber turns with the entire bottom. Still another excellent device is the bracket. This is not only made to fit either the fork side or head of a bicycle, but is adjustable to fit heads of various sizes, from smallest to largest. Also, by the slotted form of the ratchet attached to the lamp body, a single turn of the thumb-screw that regulates the angle of the lamp releases the latter so that it may be instantly lifted off of the bracket, which is left attached to the machine. This is a feature that will be appreciated by riders. The lamp complete is six inches high and weighs eighteen ounces. By test it will burn four to five hours with one charge. Western sales department of the company is at 132 Lake street, Chicago.

## THE SNOW REPAIR STAND.

This is one of the most ingenious and practical of the many inventions brought out by the Snow Wire Works of Rochester, N. Y., which has won a reputation for itself on both sides of the Atlantic for the value of its products. The repairman and the careful and methodical wheelman will both find this stand a great help, since by its use both hands are free and the several parts of the machine may quickly be brought in succession before him. The drawing gives a good general idea of the stand, but a few words of explanation are also necessary. The bi-

cycle is first secured in the holder by means of grips covered with rubber. A pawl and ratchet movement, operated either by lifting the bicycle with the hands or by pressing the foot lever at the base of the stand, allows the bicycle to be lifted, lowered, turned up or down, or swung at any angle desired. There is no position that cannot be secured for the repairer's or cleaner's convenience, and so simple is the mechanism that a child can operate it. The different parts of the bicycle are successively brought within easy reach, and all the time the hands are free for work. This stand is so eminently practical that it seems almost certain to become as popular as all of the company's products in this line of manufacture. Jobbers have already arranged to handle it and will furnish it in any quantity on demand.

## TEN STYLES OF SNOW CHAINS.

Snow Cycle Chain Co., of Syracuse, in its brief 1899 prospectus descriptive of its product—cycle chains exclusively—is enabled to

make the clear-cut statement that quality alone determines the base price of Snow chains, and that the finish alone determines the difference in cost of the various styles. The company emphatically refuses to build a chain in which price rather than quality is paramount and therefore makes all styles of like material. An exception forms the nickel steel chain which is shown in the

accompanying illustration. This material is used in three styles, which are much more expensive than the most highly finished, nickel-plated pattern in which nickel steel is not used. Nickel steel when made into chains is susceptible of beautiful finish and by its great strength makes an extremely light chain a possibility. These and every other Snow chain bear the company's name as a guarantee against misrepresentation and the company's warrant to make good by repair or replacement any imperfection in material or manufacture is unlimited in time. The Crosby & Mayer company of Buffalo, with branches in New York City, Chicago, Toledo and London, will handle the Snow chains for 1899 as in the past as general selling agents. The patented Soule link lock, also shown in illustration, is controlled by the Snow company and is used instead of chain bolt and nut. As will be readily seen, the principle of this lock is of the utmost simplicity and thoroughly reliable.

## THE ROCHESTER PEDAL.

The Rochester pedal for '99, shown in the accompanying drawing, is designed to supply a durable, well finished pedal at a low price.

The material throughout is of the highest grade and the pedal is fully guaranteed. The frame, one piece of sheet steel, is fastened to the solid steel center by spinning over the ends of the arms, thus making the body perfectly rigid. Pins and cones are turned from the solid bar, case hardened, ground and polished. By a special process the threads and pins are not hardened with the cones and then drawn, but are left soft throughout the hardening process. The cones are so arranged on the pin that absolute adjustment is secured, and the cone is then locked, preventing tightening or binding. The Rochester Pedal Co., Rochester, N. Y., are the makers, and will furnish full information on request.

## MEISELBACH'S 1899 HUBS.

A. D. Meiselbach of North Milwaukee, Wis., makes it his aim to incorporate in his large production for jobbers all valuable features of construction as soon as they can be turned out economically by the use of automatic machinery and as soon as their value is recognized as indisputable. An example of this is noticed in the hubs which are shown in the accompanying illustration and which form part of the regular equipment of one of his lines. The usual style of hub renders it necessary to spread the

lower ends of the fork sides in order to put in the front wheel, thereby usually springing one of the fork sides more than the other, rendering them liable to break, and, at the same time, very often throwing the wheel out of line. The simple remedy of making the axle removable without interference with the ball bearings and chain adjustment has only been adopted by a few manufacturers on their high-grade machines. It is also found in these Meiselbach hubs in connection with other particulars of construction which entitle them to careful inspection.

## MASTER OF THE ART OF PUBLICITY.

No more attractive advertising was ever printed in any trade paper than is at the present moment being used for the purpose of exploiting the merits of the Claus handle-

bar. It is a thousand pities that other advertisers in the Cycle Age will not imitate so superior a form of work. In graphic character, in aptness of illustration, in artistic ensemble, in the joining of happy phraseology to equally happy drawings, in power to arrest attention, it is easily in the lead. And all this is due to the Claus handlebar company's energetic and facile manager, Mr. W. J. Krauthoefer. Mr. Krauthoefer has been connected with the company ever since it was organized, but did not take an active interest in it until the opening of this season's business, when, owing to the company's increase of business, his services were demanded at the head of the concern. He is a most persistent and progressive worker and when not busy at his desk is out looking for business. A number of the largest orders were secured by him on several of these occasions. Mr. Krauthoefer is a firm believer in publicity. He has often said that a good thing unknown is not worth a name. The business of the Claus people is probably the largest of any handlebar company in the world, and it is only a man with the unlimited energy of Mr. Krauthoefer who is capable of leading it to success.

ADAMS & WESTLAKE LINE FOR '99.

The Adams & Westlake Co., of Chicago, in making its '99 announcement, states that it will sell only to agents the coming season. Adlakes will be made in two grades—Adlake Specials, listing at \$60, and Adlakes, listing at \$40. A cheaper line will be made under the Alaska name, to list at \$30. Adlake Specials will be made in eleven models,

Model A—Adlake Special, 30-in. wheels. Price, \$60.

Model R—Adlake Special, Racer. Price, \$60.

Model E—Ladies' Adlake Special. Price, \$60.

A and B being 22 and 24-inch frames, fitted with 28 and 30-inch wheels, C a 20-inch frame with 28-inch wheels, R the racer, with 22-inch frame and 28-inch wheels, E and F, the women's models, with 21 and 23-inch frames and 28-inch wheels, G and H, the double-diamond and combination tandems, with 23-inch frames, and K, a 21-inch tandem. All the tandems list at \$90. Specifications of the Adlake Special men's 30-inch wheel roadster are as follows: Height, 22 inches; head, 4½ inches; drop to hanger, 3½ inches; wheel base, 45½ inches; tread, 5 inches; head, 1½ inches diameter; main top tube, 1½ inches; main lower and diagonal tubes, 1¼ inches; rear upper tube, ¾ inch; rear forks, D-shaped, ¾ inch at hanger, tapered to ¾ inch at fork ends. All joints flush and heavily reinforced. All tubing of best seamless cold drawn steel. Front forks are 1¼ inches wide, taper gauge and reinforced; stem, 1½ inch seamless tubing, reinforced; Adlake triple arch crown. Wheels are both 30-inch diameter, 32 piano wire spokes in front and 36 in rear; rims enameled black with natural wood edge and gold line. The hubs are entirely new, being of the cup-adjusting variety, the cups being held by locking collars. Cones are fast on the axle, adjusting being done by turning the left-hand collar and cup. Cones and cups are of the best tool steel hardened and ground. Cups are ball retaining and dust-proof. Cranks are diamond pattern, 6½ or seven inches, made from best spring steel tempered in oil; two-piece shaft fitted with bearings of new construction. Cups are ball-retaining and are easily removed when desired, and the whole construction is dust-proof. Cups and cones are of special tool steel hardened and

ground. Chain adjustment is new and simple. By removing two bolts the rear wheel may be taken from the frame without removing the chain bolt or touching chain or wheel adjustment. The wheel may be removed and replaced in 30 seconds, as no time is lost in the readjustment of any part. Handlebars are adjustable, with the Adlake internal fastenings, which are also used with the L seat-post. Pedals are Adlake rat-trap or rubber. Finish is ivory white, ornamented and striped in gold. All nickeling is done on duplex copper plate. Gear is anything that 8 or 9-tooth rear and 17 to 27-tooth front sprocket will make. The same general

Model H—Adlake Comb. Tandem. Price, \$90.

Model M—Adlake Roadster. Price, \$40.

specifications apply on all Adlake Specials. Adlakes will be made in six models, as follows: M and N, 22 and 24-inch frames, fitted with 28 and 30-inch wheels; P and S, women's, 21 and 23-inch frames, 28-inch wheels. Specifications of Model M men's roadster: Height, 22 inches; head, 6½ inches; drop to hanger, 2½ inches; wheel base, 44 inches; tread, 5 inches; head tube, 1½ inches diameter; main lower and diagonal tubes, 1¼ inches, main top tube, 1½ inches; rear forks, ¾ inch, D tapered; rear upper tubes, ¾ inch; flush joints throughout. Wheels 28 inches, 32 and 36 swaged steel spokes in front and rear respectively; wood rims, natural finish, with narrow red stripes. Hubs are turned from solid bar steel; cups and cones made from special cone steel; bearings adjustable and ball-retaining; direct oiling devices. Cranks are 6½ or 7 inches, diamond pattern; made from spring steel, two-piece of the most approved design; bearings ball-retaining and adjustable; cups and cones made from special cone steel. Chain is B pattern, 3-16 inch; hardened blocks and rivets; push back chain adjustment. Seat-post is L pattern with Adlake internal fastenings, used also in drop handlebar. Finish, Brewster green, ornamented and striped in gold; all nickeling done on copper. Gear, anything that 8 or 9-tooth rear and 22, 24 or 26-tooth front sprockets will make. Alaskas will be made in three models, as follows: Men's, 22 and 24-inch frames, and women's, 21-inch frame, all with 28-inch wheels. Specifications of this line are simi-

Model P—Ladies' Adlake. Price, \$40.

Men's Alaska Roadster. Price, \$30.

lar to above except that head tube is 1½ inches diameter, rims have black stripes, cranks are semi-diamond pattern, handlebars are upturned and finish is black, ornamented in gold.

SPALDING & BROS. NEW POLICY.

A. G. Spalding & Bros., of New York and Chicago, who have heretofore depended upon the jobbing trade for the distribution of their sporting goods, announce that after January 1 they will sell only at retail direct and to retail dealers. There will be but

two prices on the goods bearing the Spalding trademark—one for the consumer and one for the dealer—regardless of quantity. No special prices or rebates will be given to the largest purchasers, and if any dealer persists in cutting the established retail prices the company will refuse to sell him more goods. The Spalding goods will be sold at uniform prices throughout the country, thus protecting the consumer against overcharge and at the same time protecting the dealer in the fair profit he is entitled to. It is much easier, more simple and possibly more profitable for the company to sell through the jobber, but the keen competition among jobbers prevents him from making any money on the goods, and for the same reason unrestricted retail prices prevent the retailer from making a fair profit, all of which reacts on the manufacturer, who is continually called upon to reduce prices, which in effect simply tends to degrade quality. In order to successfully carry out this new method of merchandising it is necessary for the company to control the source from which the dealer draws his supplies, and for this reason, and this reason only, according to A. G. Spalding, they have found it necessary to cut off the jobber and go direct to the retail trade. The eastern and southern trade will be supplied from the New York store, the middle west from the Chicago store and the Rocky mountain states from the Denver branch. The necessary traveling salesmen will be put out to cover the territory thoroughly.

NEW DESIGNS IN RACYLE MODELS.

The Racycle line made by the Miami Cycle and Mfg. company of Middletown, O., comprises four '99 models. The Racycle people state that it is their intention to furnish a line which will make it unnecessary for dealers to handle any other machine in order to have bicycles to sell at all prices. The best grade Racycle sells at seventy-five dollars and has all of the popular Racycle features of the past with the exception that the rake of the seat mast has been changed bringing the seat further back and giving more space between the hanger and the rear wheel. This change makes unnecessary the dished sprocket which has been a feat-

THE CYCLE AGE.

ure of the Racycle of the last few years. All sprockets now have straight spokes. This model has an arch crown behind the hanger. The other two leading gentlemen's models, one of which sells at fifty dollars and the other of which may be sold at any price which the agent thinks best, averaging around thirty-five dollars, are similar in appearance to the seventy-five dollar model, having the same frame lines and exterior constructive details with the exception of the arch crown back of the hanger, the rear forks in the cheaper models running directly to the hanger. A feature of all models is the built-up sheet metal arch crown of great strength and comparative lightness. All models have the distinctive seat cluster which is herewith illustrated. The seat post clamping device is original and has the advantage of always keeping the seat post in its proper alignment with the frame, it being impossible to turn the seat post, either accidentally or intentionally, sideways. The post is slotted up its rear side forming a passage for the small clamping screw which engages a bored and threaded semicircular block on the inside of the post. When the screw is tightened the block is drawn against the back wall of the seat post causing it to bind against the frame tube. All machines have well reinforced built-up flush joints and are unless otherwise specified finished in a lustrous plain black.

DISTRIBUTORS OF RAWHIDE SADDLES.

The individuality and distinctive merits of the Hollenbeck Rawhide saddle have won for it a quick appreciation by the trade, and this novel fitting seems destined to form a large part of the popular equipment of the better class of bicycles the coming season. The Hollenbeck Saddle Co., of Syracuse, N. Y., secures thorough distributing facilities for it through the following jobbers, who catalogue the 12-ounce Rawhide and furnish it to the cycle trade at factory prices: New York City—A. M. Scheffey & Co., U. S. Net & Twine Co., C. B. Baker & Co., C. Murray Rice, Schoverling, Daly & Gales, N. Y. Sporting Goods Co.; Boston—J. P. Lovell Arms Co., Brown & Wales, Wil-

liam Read & Son; Appelton & Bassett; Philadelphia—McMaster, Eldridge & Maugle, George W. Nock Supplee Hardware Co.; San Francisco, Los Angeles, Sacramento and Hawaiian Islands—Baker & Hamilton; Chicago—Chicago Tube Co., Chicago Cycle Co., Eugene Arnstein, Von Lengerke & Antoine; Buffalo—Hanna Cycle Material Co.; Rochester—Shone-Hanna Mfg. Co., Hall-Shone Co.; Syracuse—Spaulding & Co., H. R. Olmsted & Son, Stearns Bicycle Agency, Frank C. Howlett; Utica—Clark, Horrocks & Co., Utica Cycle Co.; Albany—Albany Hardware & Iron Co.; Cleveland—McIntosh-Huntington Co., Collister & Sayle; Detroit—Fletcher Hardware Co., Standart Bros., Geo. Hilsendegen, William E. Metzger, G. W. Strelinger; Indianapolis—H. T. Hearsey Cycle Co., C. G. Fisher & Co., Van Camp Hardware & Iron Co.; Toledo—Viking Cycle Supply Co.; Columbus—Oscar S. Lear; Saginaw—Morley Bros.; Grand Rapids—Perkins & Richmond; Louisville—P. E. Allison; Milwaukee—Andrae Cycle Supply Co.; Minneapolis—Great Western Cycle Co.; St. Louis—A. F. Shapleigh Hardware Co.; Hartford—Cycle Supply Co.; Pittsburg—Justin Cycle Co.; Augusta—Davidson & Mathewson; Montreal, Can.—John Millen & Son; Atlanta—W. D. Alexander; Mexico—Hilario Meenen; Toronto, Can.—E. C. Stearns & Co.

#### CHASE SUSPENSION ONLY TEMPORARY.

The rumor has appeared in some of the trade papers that L. C. Chase & Co., of Boston, had retired from the tire business. This is not true. They have in no manner dismantled their factory, nor is it their intention to do so; they are to-day in position to begin manufacturing at once. They have simply suspended the manufacture of tires temporarily. After an extensive canvass of the trade, terminating two weeks ago, they concluded that the conditions now existing did not warrant them continuing on the old plans; consequently they are waiting until they have adjusted themselves to these conditions. Unless there is a material change for the better, Chase & Co. expect, soon after the first of the year, to offer their tires under conditions at prices which will be sufficient inducement to warrant the sale of as many as they care to produce. The capacity of the factory is sufficient to take care of all demands made upon it after the first of the year.

#### NEW NORMAN CONSTRUCTION.

The Norman Wheel Co., of Philadelphia, in a '99 supplement to its 1898 catalogue of Norman bicycles, goes extensively into the subject of increased sizes of ground wheels, which it advocates because of their easier riding qualities. Instead, however, of substituting two 30-inch wheels for two 28-inch wheels, it uses a 30-inch front and 32-inch rear wheel or 28-inch front and 30-inch rear. This practice is followed throughout the Norman line, including youths' and misses' machines with 22 and 24-inch wheels, in order that low frames may be used and the top bar kept level without weakening the frame by making the head impracticably short. An innovation in frame construction is the downward curving of the rear forks from the rear axle to obviate the sharp incline of these tubes when the hanger is excessively dropped. Still another deviation from recognized lines is the semi-drop frame machine for women, in which the top bar of the usual diamond frame is irregularly curved downward several inches, as shown in the second engraving herewith. The object is, of course, to provide a machine as light and stiff as a man's bicycle which can be ridden by a woman clad in a

skirt instead of the objectionable bloomers. Specifications of the Norman line for '99 are unusual. They are as follows: Seat mast and lower front reach of diamond tubing, either 1 1/2 inches or 1 1/4 inches; upper tube, 1 inch or 1 1/2 inches; lower rear stays flat oval, curved at rear end, or straight to order; upper rear braces, 5/8 inch or 3/4 inch, full D-shape, curved at upper end, as shown. Diameter of heads, 1 1/2 inches or 1 1/4 inches; length, 3 to 7 inches. Front forks, 7/8 inch or 1 inch; fork crown narrow, oval, forged in two sizes. Wheels, 22, 24, 26, 28, 30 and 32 inches, to order in any combination required.

Rims, narrow, diamond and razor back, deep sections of special design, six sizes. Sprockets, pure phosphor-bronze, 7 to 46 teeth, 32 sizes. Gear, 27 to 210. Wheel base, 35 to 48 inches, according to height of frame and size of wheels. Cranks, 5 1/2 to 8 inches. Hanger drop, 2 to 5 inches. Tread, exactly 3 3/4 inches from center to center of cranks, 4 1/4 inches over all. Standard finish, black and gold; rims, Aurora red and gold, and black and gold. Weights, without tires, from 16 pounds to 22 pounds, according to height of frame, size of wheels and sprockets, style of saddle, handlebars and pedals. The most liberal options are allowed on the best standard equipment. By special arrangement with the Norman Wheel Co., the Hobbs Mfg. Co., of London, Ont., will, for the present, partially assemble the Norman bicycles and handle them exclusively in Canada, and later on may manufacture the entire machines under the Norman patents. In either event, the machines will be known in Canada as the New Norman Pacemakers and the Hobbs Mfg. Co. will be the headquarters for them north of the border.

#### SOLAR LAMPS FOR NEXT YEAR.

A bright and entertaining booklet just published by the Badger Brass Mfg. Co., of Kenosha, Wis., tells the interested cycle dealer of the Solar acetylene gas lamps and the improvements which have been made in this popular lamp for 1899. The general lines are the same as in the '98 pattern, but the weight has been largely and the size slightly reduced. The bracket has been changed somewhat and the lava tip is placed in an instantaneously removable holder which will be greatly appreciated. The wick tube is

straight and a new style of valve permits the lamp to be instantly lighted. The accompanying illustration shows a cross-section of the '99 pattern.

#### LOVELL DIAMOND CYCLES FOR '99

Lovell Diamond bicycles will be made in six models for next season by the John P. Lovell Arm Co., of Boston, Mass., as follows: Model 45, light roadster, \$50; Model 46, ladies' light roadster, \$50; Model 47, men's road racer, \$65; Model 48, ladies' road racer, \$65; Model 49, combination tandem, \$100; Model 50, double diamond tandem, \$100. The men's machines are made in 22, 24 and 26-inch frame heights; the ladies' in 20, 22 and 24. All models are fitted with 28-inch wheels, and with the exception of the racing machine, which is crimson, are enameled in black or maroon, with colored or natural wood rims. Cranks are of flat pattern, 6 1/2 and 7-inch throw. Choice of seven styles of bar is given, and option on rubber or rat-trap pedals and Goodrich, M. & W., Dunlop and Corker tires. Front sprockets have 28 and 30 teeth; rear, 8 to 12. Garford saddles are regularly fitted.

#### AMERICAN MACHINE CO.'S LINE.

The American Machine Co. of Flint, Mich., departs in more than one respect from common trade methods and by doing so is enabled to announce in its 1899 catalogue that the past year has been an eminently successful one in its history. It gives a one-year guarantee with all models, ranging from \$50 to \$25 in price, and makes it a strong point to identify itself with the interests of its established agents. The catalogue gains greatly in interest by presenting each model in its true colors by means of carefully and tastily executed color prints, thereby enabling the agents to judge in advance and accurately of the effect that they will produce on customers. The color-prints are supplemented by a sheet of engravings showing construction details. The combination of the two forms of illustrations rounds off a total impression which seems much more complete than that obtained from most latter-day bicycle catalogues. The Hygienic Oscillating bicycle saddle base, which has been described in this paper, is invented and manufactured by this

company, but being in the nature of a distinct specialty is offered the trade as such, and is not incorporated in the regular equipment of the company's models. These models are American Standard, with 30-inch wheels; American Special, male and female; American Banner, male and female; American Diamond, similar to Banner, but built with flush joints throughout. The Diamond is also built in juvenile sizes. The company has branches at Columbus, O.; Detroit, and Cleveland.

#### NATIONAL SEAT POST BINDER.

The seat post binder used on the 1899 models of National bicycles made by the National Cycle Mfg. Co. of Bay City, Mich., is of the expander type and is especially praiseworthy

because of its extreme simplicity. It consists of only two parts—the long threaded nut fitting into the top of the seat post lug, and the expansion collar. To bind the post it is only necessary to screw down the nut; to loosen it the nut must be loosened and the saddle given a twisting movement, which frees the post. There are no threads to jam, as the lock does not depend upon a reverse tread to loosen it.

#### DEMAREST BICYCLES ABROAD.

An extensive foreign trade has been built up by the Demarest Mfg. Co., of Williamsport, Pa., in France, Belgium, Holland, Scandinavia, Australia, South Africa, England, Scotland, and Japan. To the latter country 150 bicycles per month are shipped by contract. In addition, negotiations are now in progress for shipments to Italy, the Argentine Republic, Cuba, and Sweden. A goodly share of this success is due to Manager MacDonald, who devotes all his time and talent to the success of this gigantic enterprise. He is a natural born manufacturer of high class goods. The 1899 Demarest model will have all the latest and most useful features. Nine years ago the company was established for the production of sewing machines, of which 20,000 a month are now made and sold. In 1891 the firm first began to make bicycles. The company has the following officers: E. R. Payne, president; Senator J. Henry Cochran, treasurer; Attorney General H. C. McCormick, secretary; Hugh MacDonald, general manager. The factory buildings are one-eighth of a mile long.

#### WILL CONTINUE MAKING KANGAROO TIRES.

In contradiction of the reports that have been circulated through the medium of advertisements, letters and personal interviews to the effect that the National India Rubber Co. of Bristol, R. I., had discontinued the manufacture of Kangaroo tires because of a suit instituted by the makers of another tire on the market of which the Kangaroo is alleged to be an infringement, the National company announces that it is still making and intends to make the Kangaroo tire, and from present indications shall have to run night and day to supply the demand for its '99 goods. The company says it will meet fairly and squarely any suits brought against it for infringement, and will protect all of its customers against suits that may be brought against them for selling or handling Kangaroo tires made under the National India Rubber Co.'s patents. The new '99 goods will retain all of the good features of the '98 product, and in addition will have many improvements which another year's experience in their manufacture has suggested.

#### BUSY ON SEYFANG HANGERS.

The Bison Mfg. Co., of Buffalo, N. Y., successors to Seyfang, Prentiss & Co., and present makers of the Bison cycles, is working a large force of men on the Seyfang hanger and bracket here shown, which are meeting with excellent success. The hanger for three-crown frames is made of one piece of steel, machined for use with 28 and 30-inch wheels, with the brazing walls on the inside of the bracket, and is designed to receive 1 1/2-inch tubing for the main body of the frame, and oval-shaped straight tubes for the rear stays, and it will permit the

not only because it can be delivered promptly but because it never disappoints. We have earned that reputation for our bicycles and are working to earn that reputation for our service. We will not make people wait—our agents can tell them so. We have built a large new factory—the finest equipped bicycle factory in the world.

WE WANT RESPONSIBLE AGENTS TO WRITE FOR PRICES.

**Julius Andrae & Sons Co.** Milwaukee, Wis.

Eastern Export Branch: 95 Reade St., New York City.

Mention The Cycle Age

use of sprockets as large as twenty-eight teeth. The hanger is made for 3 and 4-inch drop. The chain line is  $1\frac{1}{2}$  inches, tread  $\frac{3}{4}$  inches; sprockets, 24, 26 and 28 teeth for the men's hanger and 18 to 21 for the ladies'. Seven-inch oval cranks are furnished forged of the best material and workmanship. Crank shafts are of two-piece pattern, the ends securely locked by a tongue and groove device and held in position by a bolt extending through the entire length of the shaft. A lug on the right crank drives the sprocket, and a right hand threaded cone abuts the sprocket, making this of solid construction. The adjusting cone is on the left side of the hanger, which has a left hand thread, washer and lock nut. This forms the adjustment, which can be easily operated by any one. The bearings on this bracket are

of the three-point type, dust proof, and of the best material and workmanship. The four-lug bracket is designed to be used in conjunction with the above hanger mechanism, on old-style frames. It can be furnished in the rough or machined. It is built to receive  $1\frac{1}{2}$  tubing in the main frame and  $\frac{3}{8}$  round tube for the rear stays, and is made in 3 and 4-inch drops for 28 and 30-inch machines respectively. The principal feature is the inside brazing walls, which are thoroughly covered by a broad patent. The chain line is  $1\frac{1}{2}$  inches and tread  $\frac{3}{4}$  inches.

#### IDEAL DOUBLE ADJUSTING STEM.

The Ideal Plating Co., 7 Appleton street, Boston, whose Ideal adjustable bars and other goods have been favorably known to the trade for a number of years, is pushing the sale of the double adjusting stem, which was patented in 1897 and brought out last season. The rod which draws the taper plug into the correspondingly tapered and split end of the stem also binds the clamp that holds the bar in their adjusted position, thereby doing away with the head clamp and simultaneously locking the bar in place and clamping the stem in the steering stem by the single operation of turning one nut.

This stem also gives a forward and backward adjustment of  $2\frac{1}{2}$  inches and makes the bar reversible as well as adjustable. This stem is furnished with or without the bar. The Ideal company makes also a stationary, with and without internal binder, and a variety of adjustable bars for use with any of its stems, which are bored to receive bars of one-inch diameter at the middle. All these goods are heavily copper-plated before nickeling. A good demand for the Ideal bars has grown up among the riders in the east.

#### STRAUSS' NEW SUPPLY HOUSE.

Matthew Strauss, who recently sold out his interest in the trauss-Hanna Cycle Material Co., of Buffalo, has established a new cycle

supply house, under the name of Strauss Cycle Supply Co., and has secured a large building at 334 Genesee street, Buffalo, with about 12,000 feet of floor space, and expects to have one of the largest and most complete supply houses in the east. He invites correspondence from manufacturers of '99 goods, or from any one having goods on which they are willing to quote interesting prices. Mr. Strauss has been identified with the bicycle trade of Buffalo for nearly fifteen years.

#### KNURLED JAWS IN EXPANDER.

It has been the drawback to most internal expander devices for fastening of seat-posts and handlebar stems that the binding effect in course of time and by use became uncertain. When the expanding surface was small—mostly a mere edge of metal—the tubing would bulge under the pressure and after a short time the device was useless and must be adjusted in a new place. When, on the other hand, the expanding surface was larger, difficulty was experienced in bringing the two parallel cylindrical surfaces in sufficient intimate contact to bind, unless exceptionally great force was applied. Trouble of this kind was chiefly due to the fact that the cylindrical surfaces of tubing are not quite accurately cylindrical and the fit between the parts can therefore not in practice be made so close but what considerable force would be required to expand the inner member of the device until the minute rugosities of its outer surface would enter into that kind of contact with the similar rugosities of the external tube which constitutes friction. By accurate workmanship, as by turning the expander on a lathe, the trouble might be overcome to some extent, but the irregularity of the inner surface of the seat mast or fork stem would remain, and at all events it would be hard to prevent the expander from rotating even if it served to prevent up-and-down movement. A simple method for overcoming these faults has been invented by L. B. Gaylor, of the Black Mfg. Company, and applied to Tribune bicycles for 1899. It is designed for the fastening of the handlebar stem only and was

patented November 29, this year. Under this invention a series of clamping jaws is employed which is supported upon the stem of the handlebar and acts directly upon the interior of the fork stem. These clamping jaws have knurled binding surfaces and form the lower portion of spring-prongs which are integral with a short cylindrical piece which is riveted to the lower end of the handlebar stem in such manner that the jaws rest within recesses formed in the stem. The inner sides of the jaws are beveled at about the same angle as that of the conical expander which is treaded upon the lower end of the spindle extending upward through the stem and into the handlebar tee. At its upper end the spindle is threaded to receive a nut which has a square or hexagonal head by which it rests upon a washer which is placed in a recess in the tee. The clamping-jaws are of such width that they fit quite accurately, although with sufficient freedom of movement, within the recesses in the lower end of the stem, so that no lost motion exists between the jaws and the stem.

The operation of the apparatus is simple. Upon unscrewing the tubular nut the expander will move downwardly by reason of the pressure of the clamping jaws upon its conical surface, or, if preferred, in order to insure this action the washer may be dove-tailed within the tee and caused to engage with the tubular nut in any preferred manner, so that the spindle and expander will be positively forced downward when the nut is unscrewed. As the expander moves downwardly, the elasticity of the clamping-jaws causes them to move inwardly away from the walls of the steering-tube, so that the clamping action is broken. When this takes place, the handlebar and its stem may be adjusted vertically in any desired position. When such is attained, the clamping-jaws may be again forced outwardly into engagement with the walls of the steering-tube by simply screwing up

the tubular nut, and in the extensive tests that the inventor has given the apparatus he has been astonished at the rigidity with which the parts are clamped together by the exercise of a very little pressure upon the nut. The surfaces of the clamping-jaws being knurled grip the inner walls of the steering-tube with great firmness, and the inventor prefers to give to those gripping-surfaces considerable area, as shown, so that they may have large contact with the interior walls of the tube, both for the purpose of increasing their hold upon it and also for the purpose of preventing any tendency to bulge the tube. In one part of the illustration is shown the manner in which it is actually applied to Tribune bicycles, the handlebar being in front of the stem.

#### IVER JOHNSON FORK CROWN.

The accompanying illustration shows the new pattern of fork crown used on the high priced Iver Johnson bicycles. It is undoubtedly one of the neatest and strongest

crowns which has ever appeared in a bicycle. In it are combined the mechanical advantages and graceful lines of the solid round and open bridge crowns. No sectional view is presented, though on that account it is not to be imagined that the work will not stand inspection. All the vital parts of Iver Johnson bicycles are made of drop forgings.

#### AMERICAN SUBSTITUTE FOR GEAR CASE.

Walter Luther Dodge, 97 Clark street, Chicago, who makes the Sprocket chain cleaner which has been illustrated in this paper, is apparently making a success of the heretofore thankless task of marketing a special device for keeping sprocket chains in good working order. His scheme for overcoming the natural indolence of the rider and the repairman combines the requirements of efficiency, cheapness, cleanliness and ease of application to such a degree that leading jobbers have been readily persuaded to catalogue the "Sprocket" among other practical novelties.

Owing to the rapid growth of the business of the Crosby & Mayer Co., of Buffalo, N. Y., the secretary, William H. Hill, heretofore acting as eastern representative, with headquarters at 320 Broadway, New York City, has returned to the factory at Buffalo to assume a share of the increased office duties which the business demands. He will be succeeded in the eastern territory by George H. Brown, formerly manager of George Hilsendegen's fittings department, at Detroit.

Cutting, Kaestner & Co., 241 South Jefferson street, Chicago, have recently enlarged their factory and added 10,000 square feet more floor space to the plant, which now has capacity for turning out more than 200,000 saddles annually. The company states that their traveling salesman, Mr. Bice, has just secured a large season's contract from one of the largest Ohio bicycle concerns.

Mr. Wilkstrom, mechanical engineer of the Shelby Steel Tube Company, was in Toledo recently to superintend the installation of the retort oven in factory D. The oven works successfully. Superintendent Sage, of the Toledo plant, says trade indications point to a most successful year.

George H. Brown has resigned from the management of the sundries department of George Hilsendegen, to take the position of eastern representative for Crosby & Mayer, with headquarters at 320 Broadway, New York.

E. J. Welch, who recently represented New Brunswick Tire Co. in Chicago, will handle trade for the Goodyear Tire & Rubber Co. of Akron, O., in the territory west of Pittsburgh, except Chicago.

# THE PASTIME AND SPORT

## Banker Wins a Match.

For the first time since the world's championship at Vienna, George Banker has made a good showing in Europe, having won a pretty match race from Grogna, the Belgian, and Tommaselli, the Italian, at Marseilles, November 20, the first meet on the southern winter circuit. The match was for 1,200 meters. The first heat was a loafing race until the bell, when Tommaselli began the sprint and seemed to have the race won, but Banker, who seems to have again returned to

from the American Cycle Racing Association to ride exhibitions at the Garden this week interrupted his visit. The offer was accepted. The fear of suspension by The League does not worry the Midget, who will make an effort to tie up with Tod Sloan and tour the country as a jockey, going first to the races in New Orleans.

## Potter Will Not Run.

New York City, Dec. 5.—Isaac B. Potter announced to-day that he would not be

## Anti-Control Sentiment Grows.

Philadelphia, Dec. 5.—While P. S. Collins of this city, secretary-treasurer of the Pennsylvania division, L. A. W., League politician and prominent member of the Century Wheelmen of Philadelphia, was characterizing as unauthorized the use of his name in connection with the call issued last week for the formation of a new race-controlling association and was citing reasons why he thinks the racing men foolish for defying the League at this time, the Century Wheelmen, one of

PIERCE LEADS THE LONG GRIND

JACK PARSONS FINED FOR LOAFING

BANKER WINS FROM TOMMASELLI AND GROGNA

good form, went after him and, passing him at five yards from the tape, won by a wheel in 2:08 2-5. In the second heat the American took the lead and maintained it to the finish, watching his opponents for the pursuit and winning by inches from the little Belgian in 2:21 2-5. The third heat was a loaf till Tommaselli started the sprint 300 meters from the tape, winning by the width of a tire from Banker in 2:17 2-5. The series went to Banker, with Tommaselli second and Grogna third. A 2,000-meter tandem race was won by Girardet and Leynaud, with Banker and Grogna second.

## The Return of Michael.

Jimmy Michael arrived in New York last Saturday after a three weeks trip to his home in Wales, where a cable offer

a candidate for reelection to the presidency of the L. A. W. Up to this time he has declined to discuss the League political situation, stating that it was too soon to take up the subject, which interrupts the regular League work.

## Bicycle Accidents Infrequent.

The police department of Berlin, Germany, has issued a statement showing the rate of accidents to the number of vehicles in use there during 1897. The table shows that an accident happened to one in every fourteen cabs, one in every twenty-five wagons, one in every two stages (omnibuses) and one in every forty-two bicycles. And only a small number of the bicycle accidents resulted in death. The statement gives the number of bicycles in use in Berlin in 1897 as 130,000.

the largest League clubs in the country, was by some strange coincidence passing by an almost unanimous vote the resolution "That it is the sentiment of the Century Wheelmen that the League of American Wheelmen should abandon the control of cycle racing." The statement is openly made that a similar resolution will be offered at the meeting of the Pennsylvania division in this city next Saturday. With Pennsylvania and Massachusetts in favor of the League abandoning the control of racing, a great stride will have been taken toward securing the two-thirds vote necessary to bring about such a radical departure.

It can be had on any of the following well known cycles: Spalding, Pierce, Acme, Stearns, Orient, Iver-Johnson, White, Reading-Standard, Eclipse, Thomas, Wolff-American, Columbus, besides Humber, Rover, Triumph, Rudge-Whitworth and other English makes. The agent who fails to order his wheels with this equipment will be apt to have a lot of machines to carry over at the end of the season.

ture, is nearing completion. It is being constructed of macadam, is twenty-two feet wide and extends six miles into the country.

### ELKES DEFEATS TAYLORE

American Wins Hour Match by More Than a Mile—Motor Pacing Tried—Sprint Races.

New York City, Dec. 5.—About eighty of the best amateurs of the metropolitan district took part in the short races on the Madison Square ten-lap track run by the American Cycle Racing Association which opened the indoor season last Saturday night. Collett and Powell did not enter, however, fearing to imperil their eligibility to the intercollegiate championships.

The "outlaw pros" gathered to the number of thirty, among them being Gardiner, Kimble, Cooper, Eaton, Nat Butler and other shining lights of the national circuit.

It was the first appearance of Nat Butler as an outlaw and he celebrated by winning the mile championship from Bob Wathour. Cooper had a fall in his trial and Gardiner fell in the final.

Petroleum motor pacing was given its first trial. When Henri Fournier mounted the cumbersome machine first and slowly circled the oval there were derisive calls from the gallery of "choo-choo" and "ting-a-ling." After a mile, however, he got up steam and with Eddie McDuffee following, reeled off a mile very handily in 2:09 3-5. The jeers changed to cheers and it looks as though the practicability and popularity of motor pacing had been established in this country.

In the Taylore-Elkes hour tandem paced race the Frenchman's pacing was far inferior to the Yankee's and he was caught (they started from opposite ends of the track) and passed in the first mile. Taylore showed indomitable pluck to the end, at times riding many laps without pace. He wore himself out and was easily beaten by a mile and two laps. Elkes made 27.65 miles in the hour. His pace following was of the easy, impressive order shown when he made the world's hour record at Philadelphia.

Owing to the big entry list of amateurs, some of the semi-finals and finals had to be postponed. A new amateur star was disclosed in George Schreiber, who won the mile open handily from Charles Ertz. The summaries follow:

One-mile indoor amateur championship, final heat—G. C. Schreiber, first; C. M. Ertz, second; W. Torrence, third. Time, 2:54 3-5.

One-mile professional indoor championship, final heat—Nat Butler, first; Robert Walthour, second; F. F. Goodman, third; Oscar Hedstrom, fourth. Time, 2:42 4-5.

### AUSTRALIAN SEASON OPENED

Walne Makes a Record and Parsons is Fined for Loafing—Big Austral Race Prizes.

Sydney, Nov. 5.—The racing season was opened with a meet at Adelaide run on October 15 and 22. The meets were only moderately attended and the South Australian League just cleared expenses. Exceptionally fast times were made. Walne rode half a mile from scratch in :59, which stands as competition record. Jack Parsons was fined \$5 together with another rider, for loafing in their heat of the mile scratch, whereupon he scratched for all events and declared that he would not ride in South Australia again.

A great overland ride has recently been accomplished by Albert McDonald, who left Port Darwin on August 22 and arrived in Adelaide on September 19, having cycled from ocean to ocean, a distance of 2,080½ miles, in the marvellous time of 28½ days. The previous record was held by Tom Coleman in 63 days. This ride has now been accomplished three times.

A syndicate is arranging to run electric light race meets during December, January and February, two nights each

month, in Sydney, \$350 prize money is to be given each night.

The Austral meet will be held November 26, December 3 and December 10, when \$4,270 will be given in prize money. The chief events are the Austral wheel race with prizes amounting to \$2,000 and a scratch event for prizes aggregating \$850. This will be followed on January 26 and 28 and February 4 by the big Australian Natives' Association meet, when \$4,500 will be given in prizes, the principal events being the A. N. A. handicap for \$2,250 in prizes and a scratch event for \$700.

### PIERCE LEADS THE GRIND

Is Ahead of Record in Six-Day Race—Leads Miller and Waller by Sixteen Miles.

New York City, Dec. 7.—Thirty-one riders hailing from all parts of the United States and Europe, and from Australia as well, faced Starter Eddie Bald on the Madison Square Garden track when, at 12:05 Monday morning, he fired the shot that started them on the 142-hour grind that has been looked forward to with so much interest. The resolution presented to the city council to prohibit the race on the ground of cruelty, had been voted down by that body, so little interest having been shown in the measure that none but the framer was present to argue in its support and no one deigned to oppose it. A board of physicians was appointed, however, to examine the riders daily, and the health board of the city announced it would interfere to stop the race should the doctors find at any time that any of the contestants was being forced to ride against his will or when physically unfit to participate.

The contest for position at the start was between Miller and Shinneer for the lead, then between Waller and Miller. At daylight Fredericks had the lead and in the afternoon Pierce led by a mile and a half.

Waller rode 314 miles and 4 laps before making a dismount, breaking Stephane's endurance record of 272 miles made last year.

Five men dropped out the first day. Leslie fell and did not return to the track, Smith fell and broke a rib, Neal quit with a bad eye and Rice with a weak stomach, Burke and Beacon because they were tired.

Eight spills occurred during the first day, one being caused by the slipping of one of the tandems which were to pace McDuffee in a five-mile exhibition. Miller ran into the tandem and fell but was not hurt, McDuffee dislocated a thumb and Hicks of the tandem team cut his head on a post.

At the end of the seventeenth mile Pierce was about five miles behind Waller's record of last year, but at 10 o'clock Monday night, after riding twenty-two hours, was 350 yards ahead of Waller's record for the time, having ridden 419 miles 1 lap.

From the twenty-second hour to the thirty-fifth Pierce rode ahead of the record. At the thirty-fifth hour he was three miles behind, but in the next hour he went ahead again. Records fell steadily from that time. In the thirty-seventh hour Pierce rested twenty-nine minutes and slept eighteen minutes, his first sleep in the contest. He lost eight miles of his lead over Waller, but was still a mile ahead of the record at the thirty-eighth hour. His 500th mile was completed in 27:29:00, 600th in 33:34:00, and 700th in 40:06:00. At the forty-third hour he was twenty-one miles ahead of Waller, and nearing the finish of the forty-fourth hour Miller did some brilliant sprinting and took Waller's position as second. Waller kept the terrible gait set by the Chicago gripman for only a short time and then got off his wheel, yielding up second posi-

tion, to which he had held so tenaciously all day Tuesday.

Pierce's remarkable riding has changed the opinion of many who thought he had little chance for first place. His lead of more than sixteen miles makes it possible for him to rest at times for half an hour or longer without losing the lead. He is in excellent physical condition, with the only exception that the soles of his feet are sore.

Miller spends more time resting, and trusts to Pierce overtaking himself in the first half of the struggle.

Lawson shows the effects of the strain more than any of the others and seems on the point of breaking down.

Stevens has not slept yet and says he will not during the first seventy-two hours. He is apparently the freshest man in the race.

Gimm is plodding patiently and Waller is in the best of good nature, having ridden off all the crankiness with which he started.

The score at 2 a. m., Wednesday, after fifty hours' riding, was as follows:

Pierce .....	846.1	Lawson .....	760.1
Miller .....	829.6	Aaronson .....	707.7
Waller .....	813.3	Schinneer .....	664.0
Albert .....	800.0	Forster .....	677.3

- Edward Beacon, New York.
- E. C. Smith, Saratoga.

NEWS IN BRIEF.

Teddy Edwards has entirely recovered from the effects of the attack of fever that interrupted his continuous century riding and is enjoying life in New York. He intends to add eight more centuries to his record of 252 before the year ends. His employers refuse to allow him to make an effort to make up lost centuries and complete the 365.

There was but one ticket in the field for the annual election of officers of the Michigan division L. A. W., and the vote of the state was cast solidly by the chairman of the returning board. The result is: Chief consul, Edward N. Hines, Detroit; vice-consul, Wilbur T. Eldredge, West Bay City; secretary-treasurer, Henry E. Perry, Detroit.

The A. R. C. U., by unanimous vote of the executive committee, has invited all riders now in good standing with the L. A. W., except Major Taylor, Fred Titus and A. C. Mertens, to join the Union.

League members and racing men are awaiting with interest Chairman Mott's forthcoming annual report, which promises to be interesting.

VOL. XXII—No 7.

CHICAGO, DECEMBER 15, 1898.

NEW SERIES No. 56.

### HUMBER MAKERS IN DISTRESS

#### FAILURE TO PAY A DIVIDEND

**A Committee of the Stockholders is Appointed to Examine the Affairs of the Company.**

The well known English cycle making firm of Humber & Co. is in distress. Its directors have confessed inability to declare a dividend and a special committee of the stockholders has been appointed to examine the affairs of the concern. In addition it is suspected that Martin D. Rucker, the managing director, has overdrawn the commission account and through neglect of his duties is mainly responsible for an all around decline of the company's business. When demand was made for the appointment of an investigating committee, Rucker resorted to strategy by calling for a poll of the stockholders, but found himself in the company of a small minority. It was decided to conduct the inquiry on December 13.

#### Rucker is Under Suspicion.

Rucker has been one of the conspicuous men in English cycle finance for many years, but he did not attain proportions of greatness till the dazzling Hooley appeared on the scene. The two became partners in many a gigantic enterprise and grew enormously wealthy. Rucker invested in baronial estates, race horses and yachts. Last November Rucker was fined \$5,000 for contempt of court in having offered Hooley a bribe of \$5,000 to falsify his testimony before the bankruptcy court. But being a man of singular astuteness in business, as some of his victims in this country during the early period of American cycle manufacture can testify, Rucker escaped the fate of his friend. It was at his suggestion that Humber & Co., which once had control of the high grade trade in all European markets, ventured further afield and established branch factories in France, Belgium and Russia. The Russian house lost a barrel of money last year, and the collapse of the English trade in European markets, owing to sudden production in the leading countries and the competition of America, weakened the opportunity of the Belgian house.

#### French House in Difficulties.

The French enterprise of Humber & Co. was launched under peculiarly fortunate circumstances. Years ago the company's goods ruled supreme in the French market and so remained until Clement & Co., and the Gladiator company, both situated in Paris, so developed the resources of their bicycle factories, the one by the use of American

automatic machinery and the other by attention to modern design and extension of foreign connections, that the Humber people found themselves being squeezed by two formidable rivals. Then came consolidation of the three interests and a three-year period of uninterrupted success. But of late the gossips have been busy and letters recently received in this country hint at the approach of trouble for the French firm.

#### American Factory Attached.

The American branch of the parent house, too, is in difficulties, for a short time ago a tire company executed an attachment for \$4,000 on the factory at Westboro, Mass. It is one of the vagaries of the parent house to disavow connection with its American offspring whenever it falls from grace. When the slaughter of Humber's on the eastern market this year was reported in England the connection between the two concerns was repudiated, but the whole trade knows that it was temporarily advantageous to resort to such a subterfuge to sustain the reputation of the goods made in England.

#### New Factory for Ohio.

A company to be known as the Lorain Wheel Works has been organized by several Cleveland and Elyria capitalists. The property of the defunct Lorain brass works has been leased and the new company, which has a capitalization of \$100,000, will at once convert it into a fully equipped bicycle factory. The intention is to put the factory into immediate operation, as contracts are said to have been already made for a large number of machines to be delivered soon after the first of the year. The manager will be H. C. Williams, and the secretary, T. C. Moxham.

#### Ide Mfg. Co. Quits Business.

Very quietly the F. F. Ide Mfg. Co., in Peoria, Ill., have slipped out of business and are selling the machinery, small tools, shafting, pulleys, belting, etc., of the factory. Such stock as was carried over was disposed of some time ago. It is understood that the concern does not owe money to creditors.

### TIRE PATENT CLAIMS INVALID

#### COURT REBUFFS BOTH LITIGANTS

**In an Appeal on Interference it is Decided Both Palmer and Hess Claims Were Antedated.**

A great deal of excitement has been created in trade circles since it became known that the United States Court of Appeals, sitting at Cincinnati, has rendered a decision declaring invalid certain claims in the patents granted the Palmer Pneumatic Tire Co. and Henry A. Lozier, the well known bicycle maker.

It has been erroneously stated in the public prints that the court held both patents to have been anticipated by patents taken out years ago by the contending parties, and that as a consequence both litigants are thrown back on whatever rights they have under their old patents. From this statement it has been inferred that the Palmer patents, which are now controlled by the B. F. Goodrich Co., as well as the patents owned by Mr. Lozier, are ineffective in preventing anyone from manufacturing tires with the construction peculiar to Palmer and Lozier tires.

#### Not a Sweeping Decision.

While the lawyers for both parties are yet without a full transcript of the decision they are reliably informed that it is not half so sweeping as the daily papers have led interested people to suppose. Three or four years ago John F. Palmer was granted a patent on tire construction. The patent office also granted one Hess a patent on similar tire construction about the same time, three claims of which were alleged to be in interference with similar claims in the Palmer patent.

The ruling of the court now is, that the three claims in the Hess patent, which are owned by Mr. Lozier, out of the dozen or more allowed are invalid, and that the same claims which are part of the Palmer patent are also invalid. The main Palmer and Lozier patents, however, are not affected by the decision, and nobody has the right to manufacture goods of such construction as is peculiar to both the Palmer and Lozier tires.

#### Sieg Resumes Management.

The receivers of the Chas. H. Sieg Mfg. company, of Kenosha, Wis., have, upon recommendation of a majority of the creditors of the company, including Morgan & Wright, asked for and been granted a discharge, in favor of the return of affairs to the former owners. Mr. Sieg is therefore again in control of his business. The liabilities of the company when the receivers took charge of its affairs were about \$112,000 and the cash on

hand less than \$100. Now the liabilities are about \$60,000 and the cash on hand to start with more than \$7,000, with one order booked for 5,000 bicycles and another from a large Chicago house for all the machines it may require next year. During the past four months the sales of the company have amounted to about \$30,000, and an average of about forty men have been employed.

### BICYCLES BY PARCELS POST

Bill in Congress Providing for Handling of All Freight by the Postoffice Department.

Washington, Dec. 12.—A peculiar measure, now pending in Congress, has for its object extension of the postal department to cover the entire business of public transportation. It is proposed to consolidate the Interstate Commerce Commission with the Post Office Department. Under the terms of the measure the Post Office Department, thus consolidated, is directed to cover the public transportation of persons, baggage, parcels and general freight. All parcel and freight rates must be prepaid and the postage on general freight must be paid either by stamps affixed to the various articles or to the bills of lading, as the department may require. No rebates, or reductions of tolls, on parcels or on general freight shall be granted either to private individuals or to public servants, with the exception that all government supplies shall be transported free on all the lines of transportation under the control of the department.

The measure provides that on parcels over one pound and not over five pounds the postage shall be 5 cents; on parcels over five pounds and not over ten pounds, 10 cents; over 10 pounds and not over thirty pounds, 15 cents; over thirty pounds and not over sixty pounds, 20 cents; over sixty pounds and not over one hundred pounds, 25 cents, with an additional rate of five cents for each additional twenty pounds or fraction thereof. These parcel rates shall include all kinds of merchandise not of a deleterious character, and packed in accordance with the rules of the department.

The bill also provides that bicycles may be carried as baggage, subject to a toll of five cents per trip of the owner.

This remarkable measure now reposes in committee. It has attracted widespread attention, but it is hardly thought that any action will be taken on it.

### Private Trading Ticket Scheme Upheld.

Washington, Dec. 12.—In the case of the District of Columbia against Harry King, Jr., charged with conducting a gift enterprise, the jury, acting under instructions from the court, brought in a verdict of not guilty. The court held that the giving of tickets by a merchant to purchasers of goods in his store, to be redeemed by himself, is not a violation of the statute prohibiting gift enterprises, the transaction being in effect a discount.

### Decorative Plants as Sideline.

Camden, N. J., Dec. 12.—A retail cycle house in this city which heretofore has carried toys, juvenile goods and couches branched out this year and has practically a monopoly of trade in southern plants for holiday decorations. Vast quantities have been sold for decorating churches, halls and large business houses. A specialty is made of doing the decorative work and of renting palms and ferns. The plants are lasting and the work a novelty which has proved a success.

There are twenty-two bicycles and sixty-one tricycles in use by the postoffice employes of Berlin.

## LOW FOREIGN FREIGHT RATES

### THE SHIPPING RING IS BROKEN

#### Rates From New York to South African Ports are Very Much Lower Than From England.

Foreign freight rates do not, as a rule, give much concern to sellers of bicycles, parts or material. And yet in the whole scheme of foreign trade there is no more important factor. Sometimes a distant market is so affected by freight quotations that the currents of trade are violently changed, and a nation's goods which have been in strong demand one year are not wanted the next.

During the past year, writes a traveling correspondent of the National Association of Manufacturers, freight has been delivered to all the South African ports from New York at an average of about 20 per cent cheaper than from London, while during August and September of this year the difference has been even greater.

The present low rates from the United States to South African ports are not due to any philanthropic efforts on the part of the transportation companies, but result from a freight war which is to determine the "zone of influence" of several shipping lines which are at loggerheads with each other. The American-Australian ships have recently taken up South African business while the American-South African lines have gone in for Australian trade. A spirited war is now being waged. All of the steamers sail under English register and two regular English companies are in the contest.

#### English Makers Are Alarmed.

In England, among both manufacturers and exporters, the American freight cut is being warmly discussed. In studying the complaint of all classes mentioned, the fact is brought out that, especially in South African trade, there is a strong combination among all the carrying companies by which they are bound to maintain a fixed rate of freight as well as passenger fare. There have been many statements made in public meetings and trade conferences of individuals interested in having rates reduced which, if true, prove that Americans have not a monopoly on monopolies.

It has been inferred that in order to uphold the present rates between England and South Africa, and vice versa, the large and more influential shippers are given rebates and commissions which the colonists argue must come out of their pockets. The English shipping ring in defense of its position claims it cannot possibly afford to deliver goods at lower rates owing to the lack of freight coming home, and both the English transportation companies, the shippers and manufacturers and anti-American colonial merchants place most of the blame on the English companies sailing out of New York, who have been responsible for the American cut rates.

#### American Shippers Hold Aloof.

It is said that strong pressure is being brought to bear on these latter companies, in order to force them to maintain a general rate at least equivalent to the English shipping ring tariff, but if they run up against the American export shipping concerns interested in this conflict without a good cash argument, their efforts will result in naught.

One thing is certain, however, and that is that it behooves American exporters to maintain an assured low, regular rate of freight between South Africa, Australia and the United States if we desire to be important factors in the trade, and

what applies to these two export markets applies to all of them. It is a point of special importance.

This little cut in rates, seemingly of such small import, has set the English manufacturing and shipping world agog. Books have recently been written on the subject, striving principally to show the unjust methods of the English shipping ring. It has become one of the chief topics of discussion in the various local chambers of commerce throughout South Africa and Australia, and all the trade journals are full of it.

The delivery of American products to South Africa and Australia is now the chief secret of maintaining a satisfactory trade with these two territories, because it has been amply demonstrated that we can and are making goods suited to their markets.

#### No Return Cargoes.

A feature which would insure a cheap, prompt and regular transportation would be that of encouraging the purchase of all raw material we possibly can from these two colonies, for it is the lack of cargo coming back which to-day causes rates to be as high as they are. This is especially the case with South Africa. Our steamers usually go out with a full cargo, and come home in ballast. The freights out must pay the expense of the whole voyage. Unfortunately, the exports from South Africa are so meagre that for at least some years to come we cannot hope to buy much from its producers.

In addition to greatly lowering rates and producing a better transportation service, the collapse of the American-Australian shipping trust in itself must prove to be a great boon to American manufacturers.

#### Shipping Ring Broken Up.

To state the case mildly, the American export trade with Australia has for years past been controlled by a combination of exporters, a transportation corporation and a lot of Australian merchants who must have believed in the policy of small sales and large profits, if the testimony from Australia is anywhere near correct. Wholesale profits of 100 per cent on American goods were for several years considered only fair, while on many commodities the rate of profit was greater. At the same time English goods of similar character were being wholesaled at 20 per cent profit.

This great difference between the prices of English and American goods was maintained by a combination of Australian importers for two main reasons: First, because, supported by our export houses, who profess to have the American manufacturer's interests at heart, they had control of all the American goods going into the market. It was impossible to ship a case of goods into Australia direct from America without going through the hands of this combination. Secondly, among the Australian jobbers there were many very anti-American in feeling, who tried their best to keep up American retail prices, so as to show the local consumer how costly our goods were.

To-day we may thank this patriotic combination for doing more than any one else to create an impression in Australia that American goods are far more costly than those of English manufacture.

That shipping ring is now broken up, and it is the duty of every interested manufacturer to see that it remains broken.

An extra appropriation will be asked for by the war ministry of France, in the budget for 1899, for the creation of a bicycle company of 200 men, for every independent cavalry division on French territory. There are seven such divisions.

**LARGE PROFITS IN AUSTRALIA****STRANGE CONDITION OF TRADE**

**From 100 to 300 Per Cent Profit Realized on Imported Bicycles—Placing American Agencies.**

Sydney, Dec. 12.—It is a somewhat curious condition of the Australian market that while the bonded warehouses have long been full of imported bicycles and auction sales have been frequent of late, machines thus sold seldom bringing more than \$45, the better class of foreign bicycles are sold at the agencies at prices out of all proportion to the cost of those machines delivered at Australian ports. Of the two Canadian machines represented here one is landed for less than \$35 and sold for \$140, and the other is landed here for even less and is never sold for less than \$125. Of English wheels the Rover is landed at less than \$60 and is sold at \$130, and the Swift is sold in London at \$75, while the Australian agents ask \$140. These are mentioned just to give an idea of the huge profit made on bicycles in Australia. If a first-class American machine could be put on to the Australian market at \$85 it would take immensely. The high grade American bicycle, such as the Cleveland, when properly rigged, has a much better appearance than many of the others landed here, and will always command a good sale.

**Would Take American Agency Now.**

The Austral Cycle agency would not in the past accept the agency for anything but American machines, for some reason known only to themselves. They are the offspring of the John Griffiths Association of London. At the present time, however, they would probably be glad of the agency of a good American wheel. At one time they were offered the agency for a Canadian line to be sold to them at a little more than \$35 a machine, but they refused; then the Goold Bicycle company opened branches all over Australia, and at the present time are selling this same machine at \$140 and doing good business.

American tires are not handled properly here, with the exception of the Morgan & Wright in Melbourne and the Hartford in New South Wales. Perdriau holds the agency for one of the leading American single-tube tires in New South Wales, but does not endeavor to push it, as he also manufactures a tire of his own. The single-tube tire does not take on at all well out here, although where their contracts permit, the racing men use them and say that they are the fastest.

**Hardware Dealers Are Poor Agents.**

When manufacturers are determining who shall act as their agents they should be careful not to give the agency to any of the big iron and hardware firms, as they do not push it once they get the agency. An Ohio made machine, which is considered by good mechanics to be a perfect bicycle, is handled in New South Wales by a big hardware firm, but they do not go out of their way to attempt to make sales. An American traveler who was out here three years ago fixed the agency for his machine with a big hardware firm, which has some of the original machines in stock yet and has never been known to advertise the line. On the other hand, when the agency for any line is given to a bicycle firm, the members know that they must sell the machines to make a living and to be successful they must advertise.

**Bankruptcy Law Amendment.**

Washington, D. C., Dec. 12.—An effort will be made during the present session of congress to amend that section of the

new bankruptcy law describing who may become bankrupts. The amendment provides that any person who owes debts amounting in the aggregate to \$100, except corporations, shall be entitled to the benefits of the act as a voluntary bankrupt; any person, except a wage earner, and any corporation engaged chiefly in manufacturing or mercantile pursuits, owing debts to the amount of \$1,000 or over, may be adjudged an involuntary bankrupt upon default or an impartial trial.

**SOUTHWESTERN TRADE GOOD**

**Past Season the Most Profitable Known to Los Angeles Dealers—Fifty New Repair Shops.**

Los Angeles, Dec. 10.—The past season has been an excellent one for local cycle dealers, more bicycles having been sold in Los Angeles than in any previous season. During 1897 there were many auctions of cheap machines shipped by carloads into this city from Chicago warehouses, but notwithstanding 1898 has been the record breaking year. The large volume of business done here is due to the fact that this is the distributing point for the southwest, from central California to Mexico and from New Mexico to the Pacific.

There has been a remarkable increase in the number of repair shops during the past season. Probably fifty new shops opened in Los Angeles during 1898 and all found good business except the few who failed from bad work or poor location. There were already a score and these older ones grew in business and capacity. Many of these repair shops do more or less renting. In one block on West Fifth street there are four repair shops adjoining each other.

W. K. Cowan, who has sold the Rambler for five years, either as manager of a branch house or as manager of the cycle department of a carriage and cycle establishment, this year launched into business for himself. He reports a splendid cash trade for the last three months and says he cannot get 1899 models fast enough to supply the demand that has already developed.

Manager Ostendorf, of the San Francisco house of H. A. Lozier & Co., has been in the city for several days arranging for the opening of a Cleveland branch house in which Bob Lennie will be interested, it is said.

The Avery cyclery put in a stock of golf goods the past season and has found that they help out trade greatly.

**Indicted for Illegal Use of Mails.**

Toledo, Dec. 12.—The United States grand jury indicted D. Frank Dreher last Friday for using the mails in pursuance of a scheme to defraud. The charge is based on a circular letter sent to Elwood, Ind., pretending that he was engaged in the sale of high-grade bicycles, and that on receipt of \$3.90 he would ship one of the new models, which, upon receipt, proved to be but a toy machine. The indictment also charges that there was no such concern as the "Monitor Manufacturing Company," for which Dreher pretended to act.

**Elgin Plant For Sale.**

The assets of the Elgin Sewing Machine & Bicycle Company of Elgin, Ill., are being advertised for sale by order of court, on December 15. Bids for the company's equity in the plant and for the bicycle making machinery, tools, materials and supplies, in whole or in part, will be received by Assignee Dewitt Campbell at 364 Wabash avenue, Chicago, until December 14.

Distinctive labels long used on patented articles do not become free to the world on the expiration of the patent.

**GERMAN TARIFF ON BICYCLES****CONSERVATIVE POLICY LIKELY**

**The Commercial Group of Statesmen Oppose the Views of Agrarian and Industrial Champions.**

Though little is heard at present of the threatened increase in the German tariff on American bicycles, parts and material, still the fears of our makers are by no means allayed, for the danger is not yet past. Politicians temporarily check the German makers in their desire to choke off American competition. There are in Germany, aside from merely political divisions, the shades of which are multifarious and incomprehensible to a foreigner, three well-defined groups, each representing the personal interests of its members. They are respectively the agrarians, who, if unrestrained, would abolish most of the concessions granted by the commercial treaties that were negotiated with foreign countries during the administration of Chancellor Caprivi, and, by cutting off the importation of meats and cereals, advance the local prices of animals and food products, and thus render German agriculture more profitable; secondly, the industrial group, which would lower or abolish entirely the duties and restrictions against foreign meats and breadstuffs, and, by making food as cheap as possible, facilitate low cost of production in manufactures; and, thirdly, the commercial group—merchants, bankers, and traders of all kinds—who urge the utmost freedom of trade, large international exchanges, busy railroads, canals and inland river routes, increased subsidies to ocean steamship lines, and a general open and liberal policy in all matters of trade.

**Conservative Foreign Policy.**

Theorists have been studying the results of the recent elections to the Reichstag and estimating the changes in Germany's foreign policy that may come as a result of the weakening or strengthening of the representatives of one or the other of these parties, but all predictions on that score are thus far contradictory, and appear to be based rather on the hopes than the convictions of the writers. The fact that the agrarians have lost a few seats is, however, generally accepted as meaning that the difficulties that they have helped to make about food imports will at least not be aggravated, and the poor success which special groups of manufacturers—as, for instance, the bicycle makers—have met in striving to obtain new and prohibitive duties on imported products in their line would indicate that a conservative policy is more than probable in future.

**Customs Retaliation Not Likely.**

The shrinkage of certain German exports to the United States has led some of the more aggressive journals and economists to favor the adoption of a retaliatory policy against the United States. This project appears to have gone so far that the Prussian chambers of commerce in the districts most concerned—that is to say, where sugar or textile products form the bulk of exports to America—have made a general inquiry to ascertain the opinions and wishes of merchants and manufacturers in respect to the future commercial policy of the German empire toward the United States. The result of this inquiry has been overwhelmingly against the policy of a retaliatory customs war. Germany has had recent experiences in tariff wars with Russia and Spain, and the result in both cases has been disastrous.

The Boston Cycle Board of Trade has decided against holding a Boston bicycle show next year.

## AND TRADE REVIEW

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries, \$6.00 per year.  
ALL remittances should be made to THE CYCLE AGE COMPANY.

Copyrighted, 1898. All rights reserved.

### PIN HEADS AND PIN PRICKS

That the advertising matter in this paper measured one and a half pages less one week than the week preceding, has been deemed so portentous a fact that the Wheel felt in duty bound to issue a solemn warning to its readers, exhorting them to quit the sinking Cycle Age ship and seek shelter under its own protecting and hospitable covers. Probably the semi-scholarly ruler of the Wheel's editorial destiny—and moderator of its funnygraphs—if by any chance he should see the Atlantic ocean at ebb tide would declare that its volume of water had become reduced to a point of danger for deep-draft vessels.

Emboldened by the New York paper's little quip another contemporary, the Cycling Gazette, which rarely ventures into anything more original than odoriferous self-laudation, shortly afterwards took heart to elect itself by pronouncement "the leading cycle paper of the world," by virtue of having in its issue of November 24 printed more pages than any other American cycle journal; especially reading pages. By this performance the Cycling Gazette "dispelled whatever doubt might have existed" as to its high grade quality and usefulness to the trade.

There are people who buy paintings by the yard, and consequently there are also artists who paint by the yard; authors who write by the yard, speakers who gain eminence by speaking by the yard. To those in the cycle trade who have done with the mere lingo of cyclism and the mess of self-neutralizing laudatory press notices which the Cycling Gazette claims is the pabulum still mostly wanted, the Cycle Age caters, and is quite content to have the division recognized which thus separates it from contemporaries.

### AGENTS ARE BEING COURTED

This time a year ago the agent's usefulness in distributing bicycles was assailed in many quarters, chiefly because he had for the first time in the history of the trade failed to respond to the impatient demand of manufacturers and early order goods in quantity. Mistaking this evidence of conservatism for faintheartedness, the makers turned to the department store and wooed it with a warmth which resulted in consequences that were as disastrous as they were poetically just. But now the record of the past trading season has been written up, and the manufacturers can clearly distinguish between genuine and spurious friends, an eagerness is being displayed again to cultivate cordial relations with the agent which contrasts curiously with the supercilious treatment he received a twelvemonth ago.

It is a commonly accepted belief today that had the agent succumbed to the temptations of the manufacturers last year, and fed their sanguine expectations, the season of 1898 would have been calamitous in the extreme. It was the coldness of the agent which operated to prevent the manufacturer from communicating the fever which raged in him to the people from whom he bought parts and material. In fine, if the agents of the country had failed to profit by past experience, it would not have been possible to point to the safe conditions which characterize the trade at this moment. For undeniably the trade, both

wholesale and retail, is in enjoyment of more than common good fortune, the agents having fewer mistakes to mourn and the manufacturers lighter stocks and freer markets than ever before.

So much importance is now attached to the trade functions of the agent that in their ardent quest for his favor there is danger of manufacturers adding to ranks that are already overcrowded if they fail to find suitable representation for their models as quickly as they would like. The example set by one giant concern is being imitated by many, and soon it will be possible to find, not one or two agents, but a score of them, or perhaps half a hundred, selling the same model in every large city. Only well known machines can be marketed in this manner, for they are sure to be in demand. On the other hand, even the best known bicycle with the fairest reputation is not likely to be marketed so profitably by ten houses as by one or two good firms in a large city, for the reason that the profits are too widely distributed and the chance of continuing to handle the line is too problematical. When such an argument is presented to the traveling men of the makers in question they invariably report that it will pay one substantial firm to sign a contract for the exclusive agency for the goods and so shut off competition. It is a neat policy.

But there is another policy which leads to the same end, and yet is as indirect in method as the foregoing one is direct. It has been in successful operation for a couple of years with a large manufacturing concern. Its method is to offer its goods to any agent who will agree to do as well by them as other lines he may be handling. Then, if at the end of a year's probation the agent has demonstrated his ability to sell the machines to advantage in competition with other lines, he is granted an exclusive agency.

These two policies are rival, yet similar in results. One is tried; the other is just emerging from the experimental stage. But enough is known of both to believe they will last.

### BRAZING BY IMMERSION

There are now very few American bicycle manufacturers who have not experimented with liquid brazing, and a large number of them have finally adopted the method for a part of the brazing work in their factories.

Among all the uncertainties and drawbacks to the method of which some of the experimenters have complained, this one fact stands out preeminent that several factory men whose judgment on such things it is impossible to set aside as incompetent, pronounce the process of brazing by immersion a success mechanically and satisfactory as an improvement in shop economics. And they continue to employ the process. This one fact is preeminent because it overbalances all indications that point in the opposite direction, just in the same manner as the production of a missing person alive and well, disproves at once all rumors or theories according to which he should be dead.

Under the circumstances the process of liquid brazing may therefore now unhesitatingly be declared a success. The statement may be qualified by saying that it is a success only under the proper conditions and when properly done, but that is a limitation that may be applied to everything. The bicycle is a success; yet it can be made so badly that it is fit only for the scrap heap after a month's use; and even the best made bicycle cannot be ridden comfortably by one who is doubled up with rheumatism, etc., etc. Liquid brazing saves work and money for those best versed in the application of the process. No inference is left, then for those who have arrived at a different result but that they are not well versed in the process, or else that the conditions in their factories are very different from those prevailing in the factories where success has been accomplished. It is possible that brazing work may have cost one manufacturer two thousand dollars under the flame brazing system and that he considers liquid brazing a success because it reduces this expense to twelve hundred, and that another manufacturer with the same capacity but who has managed to get all his brazing done for twelve hundred dollars by the old system, would see no sufficient reason for making a change. Such cases are theoretically possible but very unlikely to be actual; that is: between manufacturers of bicycles of the same numerical capacity there is now-

adays very little difference in the cost of brazing work by the flame brazing process except such as would mean a great difference in quality if investigated and explained. The difference in cost which may be caused by variations in construction of joints and in number of operations required for each complete bicycle are undoubtedly of minor importance; and furthermore are most likely to be duplicated by any other system of brazing.

It is only when the position of the repairman and the assembler of bicycles to order is considered, that the experience of the competent manufacturer on a larger scale ceases to be applicable. Whether liquid brazing can be made a success for the builder who produces each bicycle separately, still remains a question unanswered. But that liquid brazing in its best form represents an economy and an improvement in which the local builders perhaps cannot share, will probably not be considered a drawback to the method by manufacturers who are straining every nerve to make the public understand that factory-made bicycles are as much superior to built-to-order bicycles as the best factory-made shoes are superior to the more expensive home-made footwear which the cobbler around the corner pronounces a masterpiece of anatomical fitness.

When a few authentic facts—connected by a “long logic”—are sufficient to establish it as a certainty that liquid brazing must eventually prevail where bicycles of the present type are to be produced in quantity by economical factory methods, it is at once seen that manufacturers who have already made the process a success have no great inducement to publish the details of the shop practice by which they have accomplished so much. There is apparently nothing patentable about the whole process, and they must rely upon secrecy alone for maintaining the advantage which they have gained by dint of faith, perseverance and skill. On the other hand, those who have not yet reached so far or who have abandoned their experimenting under the influence of unscientific shop foremen and others who are chronic objectors to new things, would seem to have every reason for resuming their quest and reconsidering the subject in all its phases.

The main trouble with those who have condemned the process seems to have arisen from a fundamental misunderstanding. They have looked upon the idea of brazing by dipping as a full-fledged invention to be tried as a new hub, a new seat post or handlebar is tried. In reality it was—and is yet to the majority—an infant thought, handed over to them for fostering and schooling. While the special requirements of each factory are not by any means of great importance in the application, yet they are not to be slighted. Certain forms of tube joints require special manipulation of the frame to avoid waste of spelter, “rattlers” or accumulation of metal. The duration of immersion is somewhat conditioned by thickness of metal, etc. Screw threads need to be protected. Brazed tubing requires special precautions in composition of the spelter. These and other special requirements have been readily understood, but in compliance with the more general requirements which are common to all bicycle manufacturers there has evidently been a shortcoming, arising from the thought that the process as delivered to the manufacturer, with or without furnace, was already adapted to all practical needs.

Thus trouble was experienced in keeping the spelter at an even temperature all through the molten mass. The antiflux offered in the market was not so readily applied but what most firms quickly dispensed with it and preferred to remove the superfluous spelter by filing, sandblast or other means. One large firm is said to have devised a wiping system which removes this objection; others accomplish the removal by pickling, and a new method which promises still better results is projected. The functions of the flux floating on top of the bath were not always well understood. The thickness of the layer used even now varies from  $\frac{1}{4}$  to 3 inches. The zinc in the spelter would burn out and the fumes would be objectionable. The graphite crucibles were not renewed in time and operations had to be stopped. Clay crucibles were tried and are yet being tried. A few firms tried to enamel on top of a thin spelter coating and were doomed to disappointment.

In spite of all these tribulations the successful establishments have reached practical conclusions and others will do like-

wise in the future if they approach the subject of each and every factor that has a bearing upon the success of the process in its entirety. When all the science that enters into the subject shall have been mastered the process bids fair to become as nearly automatic as any other class of work that is done in American bicycle factories.

\* \* \* \*

All sorts of rumors are afloat with respect to the future intentions of makers of high-priced bicycles toward those who slap parts together and distribute the assembled machines in home and foreign markets to the great chagrin of the folks who have opened them up. Since it is impossible to bridge over the gulf which separates the bicycle makers from the parts and material houses, it is being considered if it is not prudent to take the fullest advantage of the opportunities which the latter class hold out to the former as well as to their competitors. It is acknowledged with grief and bitterness that a large slice of trade is captured each year by firms which have staked nothing in the way of original enterprise, and that so far from wearing down this order of competition the well established makers are by declining to participate in it actually giving it the protection needful to make it flourish. Of late, however, a violent change of feeling toward low priced manufacture has cropped out in several parts of the country. And here and there makers of good machines may be found conferring upon the subject of mass production of cheap stock, made up from parts which are for sale to everybody, and meeting the assemblers at their own game. Two well known eastern houses have already engaged in such an undertaking. In the state of Ohio others are contemplating to follow suit. The plan is this: each firm which is harassed by the competition of low priced machines is to make a certain number of cheap models, identify them with the firm's reputation for good construction, though not brand them with the nameplate of the house, solicit orders everywhere, meet quotations on competing machines, and by concerted action get control of a class of trade which through inattention to its wants has passed into the hands of people who are indifferent to the fate of the whole industry so long as they themselves are afforded a profit. Factories are to be leased and the experiment launched at once. The fruit of this blossoming enterprise will ripen a year hence.

\* \* \* \*

While the country abounds with people who can talk foreign languages in a fashion and who pretend to speak and write them with proficiency and correctness, it is lamentably poor in that class of translators who really can and will do meritorious work. The reasons for this condition are sufficiently plain, when a little thought is given to the subject, yet the fact is often overlooked when catalogues for foreign markets are to be prepared. In the absence of licensed translators, the manufacturer too often braves the risk of provoking derision or impatience among his foreign customers by placing his translating work in the hands of tyros or mere pretenders. Very few of the foreigners living in United States and compelled to earn their living by translating have thorough knowledge of their own vernacular and are especially at sea in technical terms. Those who have the knowledge are usually engaged in more profitable work. It would probably be a good plan to have all translation work which is now being done for the 1899 export trade tested before expense is incurred for printing and binding.

\* \* \* \*

If a manufacturer “salted” a gold mine he would not be in a hurry to buy the property. But he finances a cycle show—salts it—buys his way into it, and then brags about his investment. And the promoter has a fit of cacchination.

# STEARNS BICYCLES

The object of advertising is to bring business.

Upon the cordial co-operation of maker and dealer rests the foundation of success in selling bicycles.

The agents for Stearns Bicycles are regarded as a large family whose interests are our interests—whose wishes are consulted and for whose appreciation and approval it is our pleasure to strive.

The agent who handles Stearns Bicycles is sure of a successful season. Each 1899 model has been produced with the view of COMPELLING business. Each model is high-class and distinctive. There are no patterns of previous years to compete with the more profitable ones of the new season. Each detail of equipment is the finest known to the trade.

A large stock is on hand ready to be promptly shipped.

We invite correspondence with dealers who desire a PERMANENT and PROFITABLE arrangement.

The trade on the Pacific Coast supplied from our branch store, E. C. Stearns & Co., 210 McAllister Street, San Francisco.

**E. C. Stearns & Company,**  
Syracuse, N. Y.

The trade in the Dominion of Canada supplied from our Canadian factory, E. C. Stearns & Co., 67 Adelaide St. West, Toronto, Ontario.

# MILWAUKEE TIRES

PUNCTURE PROOF

**Pneumatic  
Single Tube**

**Resilient  
Easy Riding**

JOSEPH SCHLITZ BREWING CO.

MILWAUKEE, NOV. 21, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE CO., MILWAUKEE, WIS.

Gentlemen: Replying to your inquiry as to my experience so far with your puncture-proof tire, I wish to state that I am well pleased with it. I have used a pair of your tires all of last season, and have ridden over all sorts of roads, never tried to avoid broken glass or anything else liable to cause a puncture ordinarily, and my tires today are as sound as when I first used them.

In starting out on a trip now, I do so with a feeling of safety that nothing like a puncture can happen to me, which I formerly apprehended all the time. I remain, Yours truly,  
(Signed) EUGENE WUESTHOFF,  
Manager Joseph Schlitz Brewing Co.

F. C. JOHNSON, Lawyer,  
FULLER BLOCK

WINFIELD, KAS., NOV. 23, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS.

Gentlemen: I have been using your puncture-proof tires on my wheel for about eight months, and I find them to be the most durable and satisfactory tires I have ever been able to buy. Since my experience with your tire and your manner of doing business, if I were to buy any new tires I would buy your make of tires. I regard them as the best tires made. Yours truly,  
(Signed) F. C. JOHNSON.

GEO. L. TATE,  
Gunsmith and Bicycle Machinist.

LIVINGSTON, MONT., NOV. 22, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE CO., MILWAUKEE, WIS.

Gentlemen: Your favor of 17th inst. at hand. The pair of your tires that I purchased are fitted to a wheel that is used to carry mail over a very rough route. Since they were put on the machine, Oct. 10th, 1898, they have made the trip, 22 miles every day, through all kinds of weather and over all kinds of roads and these roads are through some of the worst cactus country to be found, and many times the mail carrier has to leave the road to avoid certain bad places, this being done without a single puncture or any attention to the tires.

Respectfully,  
(Signed) GEO. L. TATE.

MENOMINEE, MICH., NOV. 21, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS.

Gentlemen: Before using your Milwaukee Patent Puncture-Proof Tire I was puncturing my tires about twice a week. Since riding your tires I have never had a puncture, and this is so desirable to me I would not change back at twice the cost of your tire.

Yours truly,  
(Signed) H. O. CARPENTER.

**MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS., U. S. A.**

## OUR CYCLE TRADE IN ENGLAND

### Increasing Demand for Stampings—Factory Managers Outgrowing Their Prejudice Against Our Goods

To show the opportunities existing in Great Britain for our bicycle makers it may be mentioned that a large American house with direct representation in London sold to a Scotch firm a short time ago 1,000 machines, to be delivered during the forthcoming season. Unquestionably, if bicycles are sent over according to English requirements, and the tastes of buyers in the various details cultivated, there is no reason why a large business should not be done. Thoroughly good bicycles are now sold in England from \$50 to \$60.

If orders are filled promptly and with exactness bicycle fittings can be sold with better advantage than in any of our foreign markets. There is a good demand and ready sale for well-made saddles, hubs, pedals, etc. Sheet-steel stampings are growing in favor. Malleable iron castings are also in demand, and the high-class work of this description turned out in the United States finds a ready sale.

#### Stampings Are Pushed Hard.

Sheet-steel stampings, as applied to lugs, bottom brackets and other fittings of a bicycle, are not a new feature in Great Britain, but are now being pushed hard by Americans. The fact is that the application of sheet-steel stampings to bicycle uses was first made in England, but without satisfactory results, due to the very high grade of castings made there at the time, and also because there was a failure to improve on the early stampings, which turned out badly.

#### Our Rear Fork Ends Unsuitable.

The American idea of building bicycles is to get good results with the least possible complexity of parts. Some English makers seem to prefer intricacy of construction. Thus the first difficulty which arises before the salesman is that he cannot quite conform to several features of the English design. This means that a machine frame set of stampings must be made up of fewer parts, several not quite applicable here being left out, and the sale is not so profitable. One part not applicable is the rear fork end which is furnished by the American manufacturers, and a sale is often lost because this fitting is not adjustable. The English pattern, although much more bulky in appearance, enables the manufacturer to adjust it to any height of frame, while the fitting furnished by the American is available for one angle only; therefore, the change in the height of the frame necessitates using a different rear fork end. The English post lug is in a single piece, and the back stays are fastened with a bolt, and, as the stays are adjustable to different heights, the angle at that lug changes, affecting at the same time the angle of the fork end. Fork ends are cheap, and many angles may ultimately be stocked; or the American stamped post lug or cluster, having either two, three, or four branches, as necessary, may be adopted.

The great difficulty is, of course, to overcome past prejudices. While it is very hard and discouraging work, progress is being made, and most of the manufacturers are ready to take a look at the samples—something few of them would think of doing last spring.

#### Factory Managers Are Timid.

The next trouble is that everything that can be classed as American is con-

demned, until its superiority is clearly proven. There is something equivalent to a high tariff in this fact. The statement that the use of an article would close a portion of a plant is frequently found to be an argument for not using it, as there are many reasons why some people would and even should prefer to keep a plant going. There are managers who frankly admit the advantages and superiority of sheet-steel stampings, but who prefer to build machines on old lines, as there is no necessity then of their having to conduct a campaign of education with their customers, the agents, and of the agents in turn convincing the bicycle riders.

Some stampings were sold last year, and there was delay in deliveries. While most of those who bought are buying again this year, it is only because they liked the article.

#### Work of Salesmen is Laborious.

It might be well to remember that selling goods here is not an easy task. There are no notions of hospitality for salesmen, and while waiting to see the manager their time is spent standing, not sitting, in a cold and shabby looking area way, with no certainty but that the errand boy or the card clerk has sized them up as in his opinion of no importance, with the result that he will not deliver the card promptly. He may even, without delivering it at all, say, "Nothing in your line is wanted to-day."

So long a time is spent at lunch in this country that the hours in which a salesman can do business are few. This means a great cost in selling. So much time is consumed in trying to see the buyers of houses, who frequently assert their importance in that way, that few sales can be made in a day, and this means further cost. In English trade, this has required an increase in the number of commercial travelers, and, as only so much money can be afforded in selling goods, it has also caused lower salaries and cheapened the class of men. The American salesmen have found their ingenuity tested to the utmost, but frequently manage to escape the petty buyer and his small ways and see the head of the house.

#### Bad Packing Leads to Trouble.

About six months ago, when bicycle prices were higher in England than they are to-day, a rich and reputable firm of Birmingham merchants with a big continental trade ordered, at a figure considered high at home, two hundred American bicycles for shipment to a port in Russia, where the shipment was to be divided and forwarded to several different points. Men's and ladies' machines were wanted in a stated proportion and, of course, with different frame heights, and both maroon and black enameling was desired. It was directed that six frames be packed in each frame case, and six wheels in each wheel case, and that a combination system of lettering and numbering be adopted, so that sets of six bicycles of any kind could be identified.

But the American manufacturer—and the concern is well known—did not rise to the occasion, and with one exception not a numbered or lettered case corresponded, and no purchaser got just what he wanted. Twenty-six-inch wheels were coupled with shipments of frames with 28-inch front forks and fitted with 28-inch mud guards, making it impossible for the brakes to reach the tires by over an inch;

maroon was mixed with black parts; pedals were packed so badly they arrived with broken centers, spindles, or cones; and it is stated that the chains were actually tied around the saddle post lug, and so loosely that they had swung around among the frames and chipped the enamel.

#### Not According to Specifications.

In addition there is a charge of bad faith in shipping goods not up to an honest standard. It is held that there is an incrustation which, having set up underneath the enamel, indicates that the frames were rusty before the enamel was put on. It is also claimed that old-pattern frames were sent, and that catalogues clearly show that the frames were second grade of the previous season, equivalent to a third grade of the present. It must be patent to any American that with this kind of a story current, even people anxious to purchase hesitate about paying cash against documents.

#### Foreign Buyers Are Very Alert.

An American salesman living in Birmingham was engaged by an American firm to handle its bicycles in England. As he learned afterwards, the firm was regarded as "sharp traders." This salesman had not been home for a couple of years, and was not, in consequence, an up-to-date American, and believed his employers when they said the sample bicycle was their 1898 model. He states that he placed 450 machines with small dealers at \$60, a big figure, and he got it because the machine had borne a very good reputation; but before the deliveries were completed, a few samples of the real 1898 model arrived in England, and an English bicycle paper happened about that time to print the fact that the firm in question were selling their 1897 model in the United States at retail for \$30, and that the machines were being sold at that price extensively throughout the United States. The 1897 models which the salesman had sold, believing they were 1898 models, were promptly returned, and the firm had hurt not only themselves, had lost the respect of their salesman, but had injured the American bicycle trade generally.

#### Bitter Experience of Lamp Makers.

A large American bicycle lamp concern, manufacturing a first-class article, was so anxious to introduce its goods into Great Britain that it accepted the offer of a big London jobbing house to buy 20,000 lamps at a very low or so-called introductory figure. In this lamp, a felt and not a knitted wick is used, and a felt wick requires the very best quality of petroleum. It is, however, very difficult to buy good petroleum in England. Petroleum oils have fancy names; the fancier the poorer. The name petroleum is almost unknown, and coal oil and kerosene, unheard of. Now, to make this lamp a success, there was needed a campaign of education, and the purchasers would have had to be taught to demand and insist upon white rose oil—a high grade, refined American petroleum—and be impressed with the absolute necessity of taking no other; for many shopkeepers in England will never sell you anything you want, but always insist on selling you something else, until they realize that you will only have what you asked for. The big jobbing house did not employ a campaign of education and had most of the lamps left on its hands.

Early last spring—just a year too late—the lamp manufacturers determined to enter into a well-organized campaign in behalf of their lamp. They had an 1898 model which was superior to the 1897, but the jobbing house demanded that they take back the 14,000 lamps they had left out of the 20,000, and fought them when no attention was paid to their demand, and wherever the Americans went they found the 1897 model advertised at

50 per cent, and they discovered that the 6,000 lamps which had been sold had proven unsatisfactory because bad oil had been used; and the American concern had to give up British trade. This is a case of a good business spoiled by a bad start. If they had put their men in the field the year before to co-operate with the jobbing house, there would have been a great success.

IN THE FOREIGN MARKETS

Imposture Practised by English Firms Desiring Exclusive Agencies—Credits in Colombia.

Quite recently attention was drawn to the dangerous haste with which American manufacturers granted exclusive agencies for continental Europe and Great Britain, when they were personally sought by well-accredited foreigners who represented houses of undoubted financial responsibility, frequently ready to pay 70, 80, or 90 per cent on consignments, or even as a tempting bait, "cash f. o. b., New York." It was then urged that they take time for investigation and satisfy themselves that the motive behind such a proposition was not an intention to control and hamper a possible future competitor. There is a great deal of such trickery practiced against Americans. It can be prevented if manufacturers will test the first strong house which bids for an exclusive agency. Offer an exclusive contract for a term of years; but retain, in a carefully worded paragraph, the right to supplement the merchant's efforts by sending American salesmen, who are to work in harmony with the merchant firm, yet to be subject to home orders. Make the commission less when men are in the field, during the introductory and educational campaign period, and larger when they are recalled; but retain also the right to make the decision when that period shall end. Sell all goods through the agents, and never sneak a commission from them. Live up to the spirit as well as the letter of the contract. Most of the successful businesses in England in American automatic machinery and pig iron have been built on these lines.

In Colombia the matter of credits is always of deep interest. European houses give six and twelve months credit, and some of them extend this to eighteen months, charging interest on the sales. When one considers that the time required to ship some goods is from six to twelve months, it is not to be wondered that merchants complain of short credits; for it sometimes happens that the time for payment expires some months before they receive the goods. During the year the United States' exports to Colombia have languished on account of the commercial depression there prevailing and the small coffee crop.

Guatemala is very mountainous. In general it may be said that American goods are too good for this market. They should be made to sell cheaply, and should be showy. The Germans and English are our most active competitors.

India, with its population of 250,000,000, is a good market for American bicycles, though the demand is chiefly confined to that portion of the country which is under British control. The following table, showing the imports of merchandise in the last three years, enables the student of our foreign trade to locate the position of the United States among competing nations:

	1895-96.	1896-97.	1897-98.
United Kingdom . . . . .	\$146,100,600	\$156,294,253	\$144,485,801
Germany . . . . .	7,290,505	7,154,245	7,547,008
Belgium . . . . .	8,461,902	7,451,479	7,083,000
Austria-Hungary . . . . .	4,107,100	4,612,142	6,655,058
United States . . . . .	3,532,257	4,547,541	4,436,332
France . . . . .	3,034,807	2,852,397	2,736,667

The Crown Electrical Works, of St. Charles, Ill., has recently received an order from Europe for 5,000 Crown cycle chains.

TEN MONTHS' CYCLE EXPORTS

GERMANY IS BUYING HEAVILY

Gratifying Increase in Our Trade With Argentine Republic—African Demand Slackened in October.

Exports of bicycles and bicycle material from the port of New York for the week ending December 6 are recorded as follows:

	Bicycles.	Materials.
England . . . . .	\$ 3,888	\$ 4,980
Ireland . . . . .	40	2,269
France . . . . .	7,822	13,410
Germany . . . . .	8,547	603
Belgium . . . . .	52	1,303
Holland . . . . .	1,830	3,681
Denmark . . . . .	1,770	1,795
Sweden . . . . .	53,469	248
Russia . . . . .	15,560	1,864
Italy . . . . .	275	709
Egypt . . . . .	709	75
Portugal . . . . .	75	111
British East India . . . . .	111	186
Australia . . . . .	186	7,068
Canada . . . . .	7,068	50
Cuba . . . . .	50	397
British West Indies . . . . .	450	255
British Guiana . . . . .	829	35
Dutch Guiana . . . . .	35	222
Ecuador . . . . .	222	20
Peru . . . . .	20	32
United States of Colombia . . . . .	32	100
Venezuela . . . . .	100	
Totals . . . . .	\$95,834	\$38,111

American Exports for October.

Governmental returns on the exports of cycles, parts and accessories for the month of October (1896, 1897 and 1898 compared) are as follows:

	1896.	1897.	1898.
United Kingdom . . . . .	\$117,299	\$58,630	\$49,507
France . . . . .	2,376	7,400	3,648
Germany . . . . .	11,413	27,928	30,458
Other Europe . . . . .	57,289	31,134	39,918
British America . . . . .	9,970	9,716	8,293

Africa . . . . .	33,735	132,022	762
Other Countries . . . . .			1,699

The past season has not been satisfactory for the Belgian trade. Many houses have big stocks. The main cause of this quietness in the industry has been the American competition. The production and the imports increased in disproportion and the introduction of some heavy customs duties in foreign countries to which Belgium exported was not less damaging. The statistics show progress over former years, but this progress is not proportionate with the growth of for-

mer years. During the month of October the cycle exports amounted to \$20,000, as against \$15,000 in October, 1897. For the first ten months of 1898 the total value of cycle exports was \$500,000, as against \$400,000 in 1897 and \$300,000 in 1896. In 1897 the imports made up a sum of \$500,000, while in 1896 they reached only \$350,000. The exports to England and France increased, those to Germany lessened, and the exports to Holland remained stationary.

SPAULDING SCREW PLANT SOLD

Buffalo Factory Is Bid in By Assignee Keim Under First Mortgage—His Plans.

Buffalo, Dec. 12.—The entire plant of the Spaulding Machine Screw company, which went into the hands of a receiver September 15 as a preliminary move toward dissolution of partnership, was sold at public auction last Thursday to satisfy a first mortgage held by John R. Keim of New York city.

Of the 150 or more creditors of the concern but two were present at the sale and but one bid was received, that of Mr. Keim, who offered \$10,000, and the property was knocked down to him at that figure. The sale is subject to an incumbrance of about \$22,000. A deficiency judgment to the amount of about \$42,000 is to be entered against the stockholders of the company.

The Spaulding company was incorporated about five years ago for \$300,000 to manufacture bicycle parts. About a year or so ago a chattel mortgage for \$50,000 in favor of Mr. Keim was recorded on the company's property. Mr. Keim was connected with the company from the time of its assignment some two years ago. He was made assignee and managed the reorganization which followed.

It is not known definitely what Mr. Keim's intentions are with regard to the future of the plant, but it is expected, Receiver Lewis says, that a company will be organized in the near future to carry on the business, and he believes that the factory will be in full operation within a very short while. He says there were sufficient orders on the company's books when proceedings were begun, to keep the plant running for three months or more. He worked the plant up to the day of the sale and used up all of the stock on hand.

To Wind Up Machine Screw Co.'s Affairs.

All persons interested in the Spaulding Machine Screw Company, of Buffalo, are required by court to show cause before Fred B. Skinner, who has been appointed referee for that purpose, at his office, 28 Church street, on December 22, at 11 o'clock in the forenoon, why the corporation should not be dissolved in accordance with the petition in insolvency and for voluntary dissolution heard September 15 at a special term of the supreme court of New York. The referee will then make his report as soon as possible and be dismissed.

Building Up a Foreign Trade.

Failure in export efforts is nearly always due to American impatience and to unwillingness to accept new trade conditions. Salesmen are not given time to build up a new business. In most cases it is senseless to expect a profit the first year. Building up a foreign business is as much an investment, requiring time and money, as is the building of a new wing to a factory.

A common carrier cannot, by contract, limit its liability for damages resulting from its liability to exercise ordinary care.

## CYCLE SHOWS IN DISFAVOR

### Testimony of Manufacturers is Overwhelmingly Against the Exhibitions—Local Shows Favored

Further evidence of the disrelish of manufacturers for that unpalatable thing, the cycle show, is presented on this page. It is not the intention to smother the views of those who may, for some reason or other, favor exhibitions, and on this account the Cycle Age throws open its reading columns to all who have an inclination to dispute the soundness of the opinions heretofore put forward in connection with the subject. Minority opinion, though often eclipsed, is of value.

A correspondent of this paper complains that it is unfair to asperse the motives of Promoter Van Sicklen, who is whooping up the Chicago show. The critic does not stop to consider that Van Sicklen, who he asserts is promoting a show which may exert a local usefulness, is endeavoring to persuade makers that it is of national importance. If Van Sicklen had elected to conduct a local show, and not tried to persuade agents that it was to be an exposition of all the new cycle wares, he would have been immune from reproach. His sin is that of misrepresentation.

#### An Idea That Is Spreading.

In the following letter is found an expression of thought that by this time is pretty generally shared by makers of all kinds:

To the Editor:—We have been asked by a dealer in Chicago to contribute towards taking space for him to exhibit our goods in the cycle show. We have written and given him the substance of our ideas on cycle shows.

The writer always maintained that it was an imposition on the part of the cycle show managers to ask manufacturers and dealers to bring their products, which go to make up the show, and then ask them to pay for exhibiting them. I am sure that if managers of opera or playhouses would ask actors to pay for the privilege of giving their shows on the stage, there would be no shows. I think this illustration should apply in the same way to cycle shows, for if the dealers and manufacturers did not make an exhibit there surely would be no cycle shows. There is no question in my mind but that the admission fees have always paid the expenses and a fair margin on all shows in the past.

ED. A. THIEM.

The Chicago show will contain 136 spaces—not 72, as stated in the last issue of this paper—and the revenue from their sale is expected to be as follows:

12 spaces at \$125.....	\$ 1,500
72 spaces at 100.....	7,200
3 spaces at 90.....	270
49 spaces at 75.....	3,675
Total .....	\$12,645

Another batch of opinions on the subject of cycle shows is herewith presented:

#### No Show Boom Needed.

The bicycle business needs a boom. That is the cry of the showman and the daily newspapers. Boom is a very unhealthy word. It means inflation and a consequent collapse. About every town in the union, from Plymouth Rock to Seattle, has had a boom and the after effects have always been disastrous. The greatest boom Chicago ever had was during the World's Fair, and it never wants another. In other words a boom is apt to be a boomerang.

We get our ideas of cycle shows from England, a tight little island that you can run over in a few hours. There the agent at slight expense can run up to London and go home the same day; but with us the agent is from 500 to 1,000 miles away and the walking is not good in January. When he gets to the cycle show the noise and excitement is so great that before he has seen half a dozen lines he is so dazzled that he does not know where he is at, and if he is a cool hand, he will say: "I guess

I will wait until the salesmen come to my town."

Bicycles are past the missionary period, they have resolved themselves into a fixed type, it is a question of price, quality and reputation. Nothing but freaks attract attention at the shows.

If you could abolish the traveling salesmen then let us have shows. But why have both? Agents used to come to the shows, usually with the money they owed the manufacturers, and spent a week having a roaring good time, but they can't afford to do it now on the present margin of profit.

Speaking from experience every show we have ever had has been a failure from the point of view of securing agents and booking orders. Held in January they upset the salesmen's plans on the road. A show held in March, to help the local trade, might be encouraged, but you can't sell straw hats when the snow flies, or retail bicycles, much less ride them, with the thermometer at zero.

If we follow in the footsteps of the older industries we will learn from their experience that there are no booms or shows. They do not need an absinthe cocktail to give them a brace. The goods are sold in the regular channels of trade, and the sooner the bicycle gets there the better it will be for all concerned.

The best bicycle show we know of is a line of samples with a smart salesman to explain their talking points, traveling from town to town and making a personal canvass of the trade.

The bicycle is an instrument of pleasure and of utility, and is able to stand alone on its merits without the aid of the wet nurse or the molycoddler.

McKEE & HARRINGTON.

#### Can Spend Time and Money More Profitably.

We do not believe in shows, either national or local, and do not think they are any benefit to either manufacturers or dealers. Conditions have not materially changed since the National Cycle Board of Trade had this subject in hand for discussion. All the points, both pro and con, were thoroughly thrashed out and the decision arrived at that shows were detrimental. It is not our present intention to again take part in them. We think the same amount of time and money spent in other ways would promote our business to a much greater extent.

UNION CYCLE MFG. CO.

#### Have Always Opposed Shows.

We have always opposed cycle shows, and see no reason for changing our opinion.

DAY MFG. CO.

#### Will Not Exhibit in New York or Chicago.

This company is not in favor of cycle shows, and we do not expect to be represented at the Chicago and New York shows now being arranged for.

THE BRISTOL BELL CO.

#### Only the Promoters Benefit.

We do not see where bicycle shows, either national or local, would be of the slightest benefit to us. We have yet to find the manufacturer who has found shows profitable. The promoters are the beneficiaries.

RECORD PEDAL MFG. CO.

#### Would Exhibit If Forced To.

It would hardly be judicious for us to condemn cycle shows from the manufacturers' standpoint. That, of course, rests solely with the bicycle manufacturers. If they deem it necessary for their welfare to encourage the reincarnation of the cycle show, of course we should have no complaint to make, and should probably make a small exhibit, merely for the purpose of having a place to sit down and talk to our friends.

THE B. F. GOODRICH CO.

#### Heartily in Favor of Shows.

We are heartily in favor of the large cycle shows, and believe that the small, if conducted on a proper basis, will result to the advantage of both dealer and manufacturer. The same easily holds true with reference to the local cycle shows.

WALTHAM MFG. CO.

#### Too Late For Shows.

We believe that the national shows are not at all helpful to the manufacturer, entail a great deal of expense and no corresponding benefit is derived. It may be advisable, sometimes, to have local shows, with the

idea of arousing interest among the riders, but taking the matter of expense, delays, etc., incident to holding an exhibition of this kind, we do not believe that either the manufacturer or agent is benefited. As a matter of fact, we believe that the cycle trade has passed beyond its incipient stage, and while exhibitions four or five years ago served a good purpose in that they interested the general public in the machines, the industry has now settled down on a permanent, legitimate basis and shows in this line are not any more needful than exhibitions of any other article manufactured. Since the opening of the bicycle trade is so close at hand, exhibitions for next season are entirely out of the question.

RELAY MFG. CO.

## IN LITIGATION

### Petition of Bankruptcy Filed Against Anderson Cycle Co.—New Evidence in Worcester Case.

A petition asking Judge Swan to declare the Anderson company, of Detroit, Mich., bankrupt was filed December 5 in the United States district court by the Detroit Screw Works, the Detroit Free Press, Octavia W. Bates and George W. Bates, of Detroit, and the Excelsior Needle Co., of Torrington, Conn. The claims held by these creditors aggregate \$799.36. Last September the cycle company gave a chattel mortgage to secure these and other claims amounting altogether to \$7,457.92, with George Angell as trustee. On the following day it executed another chattel mortgage on the same effects, it is claimed, in which the petitioners are included. This, they allege, constituted a preferential act, contrary to the bankruptcy act. Proceedings were begun at the eleventh hour and the subpoena served on the trustee just in time to stop a sale under the first mortgage.

J. Frank Frier, of the Globe Cycle Co., of Buffalo, N. Y., has been declared a bankrupt on his own application. The first meeting of creditors was set for December 19. As a member of the firm he was liable on bonds of the company. In this way his total liabilities amounted to about \$200,000. There are no assets.

The Central Trust company of New York has filed a motion to set aside the recent decision holding its mortgage of \$500,000 against the Worcester Cycle company, of Middletown, to be invalid. It is claimed there is new evidence.

### Talk of Amalgamating English Shows.

The concurrent holding of the Stanley and National shows in London gave rise to the expression of many opinions as to the possibility of amalgamating the clashing interests of the two annual exhibitions so that in the future the trade will not be tossed on the horns of a dilemma and finally cajoled into the trouble and expense of making two displays where one is quite sufficient and very probably more than enough in the present state of development of the industry. For many reasons such a combination is much to be desired, according to the English trade papers, but the difficulties are great, though not by any means insuperable. The selection of a building of suitable size for holding the consolidated shows seems to be one of the main obstacles, but if the Crystal Palace were used a reduction of the areas occupied by the larger makers could be made with an increased charge for each machine shown. It is not impossible, however, that the effect of the only partial success of these last exhibitions will so deter makers from further lavish expenditure in this direction that the Crystal Palace will prove fully adequate to contain all the exhibits that manufacturers will feel disposed to make next year.

Cycle taxation is being adopted in all the leading cities in Canada. The average tax upon a rider is \$1 per year.

## Automatic Tilting Saddle—Handle Bar Reversible While Riding—Double Band Brake—New Step

**Self-Adjusting Saddle.**—The object of the saddle is to offer accommodation to the change of positions which a rider may desire to assume when endeavoring to ride with the greatest possible speed. The saddle top is of ordinary padded or unpadded pattern and is mounted on a central lug which is pivoted to the top

of the seat post clamp from which an arm extends forwardly to a point under the extreme pommel of the saddle. A segmental rod extends downwardly from the pommel and enters a hole in the front end of the extension from the clamp. Between the extension piece and the bottom of the saddle and surrounding the depending rod is a coil spring. When the rider sits well back on the saddle, as when riding easily, the saddle remains firm under him, but when, as in sprinting, he crowds to the front end of the saddle the spring gives underneath him and the pommel lowers enough to afford the desired freedom of action. The inventor is L. D. Lovekin, of Philadelphia, assignor to the Lovekin Saddle Co., of the same place.

**Adjustable Bar.**—The bar is of the ordinary plain adjustable type with the exception that the bars can be inverted from their low position and swung to their high upward position without the rider having to dismount. Inside the tee at the top of the stem is fixed a short sleeve with saw teeth on one end, which engage the teeth of a corresponding ring secured to the handlebar. A spiral spring back of the toothed sleeve and a lock nut

at the opposite end of the tee completes this part of the bar. By loosening the nut the bars may be pulled to one side against the pressure of the spring a sufficient distance to allow them, after having been freed from the engaging teeth, to be turned into whatever position is desired. On the lower reduced end of the handlebar stem is a nut on top of which rests a spiral spring abutting at the top against a collar brazed to the stem. The collar has two projections at the top that enter corresponding notches in the shoulder formed by the enlarged upper end

of the stem. The spring holds the notches and projections normally in engagement, but when the rider wishes to convert his bars from drop into up-turned, or vice versa, he loosens the binding nut on the tee, turns the bars up and then by pulling them upward against the pressure of the spring in the stem, releases the engaged projections and turns the bars around. The inventor is Albert Ross, of Woodstock, Canada.

**Back-pedaling Brake.**—At the sprocket end of the crank bracket is secured a leather covered disk adjacent to the inner face of the driving sprocket. The sprocket is not keyed to the axle but merely fitted so that it can turn in its rotation direction for a limited distance, and also so that it can move in a lateral direction along the crank shaft. The crank is firmly attached to the shaft. On the outer face of the sprocket are segmental inclines which correspond in their action to one part of a set of internal and external screwthreads. The other part of the segmental thread is on the inner face of the enlarged crank hub. When the pedals are rotated backward a short distance this segmental threading causes the

sprocket to be forced inwardly against the leather covered disk on the crank bracket, thus braking the bicycle. A forward movement of the pedals and cranks causes the sprocket to be turned outward to its normal position away from the brake disk. The segmental threading is formed by means of bosses on the outer face of the sprocket which have thread-like under-cut edges along their inner sides, forming the internal threading which matches the external threading cut on blocks on the crank hub. The inventor is G. C. Mandleberg, of Manchester, and J. J. Young, of London, England.

**Double Band Brake.**—A brake wheel of a larger diameter than is common in band brakes is attached to the rear hub and is also braced from the wheel rim by two or more spokes running tangentially in opposite directions to the regular wheel spokes. The flange of the brake wheel has a flat outer surface and a V-shaped groove extending around its inner periphery. Segmental brake bands of spring steel and of V-shaped cross section are hung within the brake wheel flange, being normally free from contact with the flange. The rear end of each segment is attached to a double link which is pivoted to a forwardly extending arm, the front end of which is slotted, sliding upon a stud supported upon an arm connecting with the bent actuating lever. The connection is made at the angle of the lever. The stud on the rear end of the connecting arm holds, besides the slotted arm, a double link the ends of which support the rear extremities of the two segmental brake bands. Running

from the bracket on the rear fork tube of the frame which supports the fulcrum of the actuating lever is an exterior brake band, also of spring steel, which entirely surrounds the brake drum and has its other end attached to the actuating lever at the same point where the arm operating the interior bands connects. The front end of the lever arm may be either fitted with a foot piece or may be attached to connecting rods or wires running to a hand-operating lever on the handlebars of the bicycle. When the forward end of the lever is pushed down-

ward, the outer band is contracted and caused to bind on the outer face of the brake wheel flange, while the distance between the ends of each inner segmental band is lessened, causing the bands to bulge in the middle and to bind upon the inner V-shaped surface of the brake drum. To assist the natural spring of the bands in keeping them out of contact when it is not desired to operate the brake, a small spiral spring may be added, as shown in the illustration. The inventor is L. E. Clark, of Shenandoah, Pa.

**Anti-Vibration Device.**—The invention, which comprises air-cushioned handlebars and seat post, is carried out by supporting the telescopic tube holding the seat post or handlebar stem, upon a pis-

ton held on a rod erected in the seat mast or head tube, a cushion of compressed air being maintained between the piston and the air tight partition near the top of the

## The Claus Bar

is creating a non-resistant, unwavering demand for itself. Its mechanical perfection is doing the work.

No other bar is so simple, strong, durable, so easy to adjust, so sure to stay adjusted.

It is the only bar that can be adjusted without a wrench. The only bar that retains its width at all adjustments. The only bar in which all parts interlock—it cannot wriggle. And the only bar guaranteed forever.

These are selling points the bicycle dealer, jobber and manufacturer cannot overlook. May we quote you prices?

**The Claus Handle Bar Mfg. Co.**

Milwaukee, Wis., U. S. A.

telescopic tube. The piston rod, which is adjustable in length for the purpose of regulating the elasticity of the cushion, is based at its lower end upon a partition which has to be built into the seat mast of the bicycle frame. The piston, comprising a pair of leather cups, carries a quantity of heavy oil in order to render its contact with the walls of the tube air tight. Air is admitted into the tube above the piston through a small hole in the wall, the hole being below the piston, so that the compressed air cannot escape after the piston has been pushed to its normal position in the tube. To keep the tube and its seat post or handlebar from turning in the seat mast or head stem, detachable links in pairs are attached between the top of the frame and the clamp which secures the post to the telescopic tube, thus forming a flexible coupling which steadies the device laterally but does not interfere with its longitudinal movement in the frame. The inventor is Francis Beauchamp, of London, England.

**Sidwell Pedal.**—This patent is for a pedal constructed on the now well known pattern of a body shorter than the entire

pedal and cross arms supporting at their ends side plates composed of one piece of metal of suitable form bent in U shape with the rounded closed end projecting beyond the outer extremity of the pedal body and protecting it. The side plate piece is thus entirely independent of the bearing parts. The inventor is Arthur Sidwell, of Waltham, Mass., assignor to Walter Measure, of Needham, Mass.

**Detachable Tire Improvement.**—This invention consists in the improvement of the flexible flap on one of the inner edges of the casing of a detachable tire of the G. & J. construction designed to cover the joint of the two edges of the casing when the tire is in place on the rim, by making the flap so wide that it cannot catch the rim grooves while the tire is being placed on the wheel, and further by making the flap of sufficient stiffness to insure against its doubling under. The flap is very flexible to the point where it leaves the edge of the casing; there it becomes so stiff that it just allows the necessary bending to conform

to the interior shape of the tire when inflated. Quick and easy assembling of the tire is thus attained. The inventor is T. B. Jeffery, of Chicago.

**Combination Step and Washer.**—By constructing a hollow step piece with an in-turned flange on its inner end and with a portion of the shell shaped internally at that inner end to conform with the rear axle nut, it is possible to slip the step on over the nut before the nut is screwed to the axle and thus form both a casing and a washer for the nut. The exterior of the step shell may be either round or hexagonal; if the former, span-

ner holes must be supplied in the step; if the latter, a common wrench can be used. The interior of the step being of the same shape as the axle nut, and fitting it closely, the latter turns with the

step. While the in-turned flange forms a sort of washer for the nut it does not act as a perfect washer, inasmuch as it turns with the nut and therefore brings the binding power of the nut upon the frame side in practically the same manner as though there were no washer of any kind round the axle. The inventor is A. R. Demory, of Milwaukee.

### M. & W. TIRES WITHOUT LACING

**Self-Closing Slits to Facilitate Repairs of Double Tube Tires—Inner Side Smooth.**

In construction of double tube tires an innovation of notable importance is presented for the trade's consideration in a device for which Fred W. Morgan, of the firm of Morgan & Wright, Chicago, has been recently granted a patent. The invention is a recent one, the application having been filed September 9 of this year, and it comprises means for allowing the opening of the casing of double tube tires of the Morgan & Wright type for the removal and repair of the inner tubes, without making necessary any cutting of lacing or relacing after the replacement of the tube. In carrying out the invention a number of longitudinal slits are cut along the under side of the casing at regular intervals, these slits being similar to the slit commonly found near the valve on the rim side of double tube tires. The object in having more

than one slit is to enable inner tube repairs to be sometimes made without the entire removal of the tube from the casing.

The slitted portions of the casing are reinforced so that the slit will be normally closed and incapable of stretching laterally or longitudinally, by the introduction of thin oblong spring stay plates. Each plate has a narrow slit running lengthwise through it, and when the plate is placed in the tire this slit coincides with the slit in the casing. The stay plates may be either molded into the tire or otherwise suitably secured, a simple way being to mold the plate between the canvas and rubber layers of the casing. While the spring plate makes it impossible for the slit surrounded by it to open laterally, it is possible by pressing downward on one side of the plate and pulling upward on the opposite side to make an

opening in the casing which will permit the removal of the inner tube. This bending of the plate sides is shown in the illustration in a side view of one of the stay plates separated from the tire. As soon as the sides of the plate are released they will spring together again, thus closing the slit in the casing. If the slit in the plate is made wide enough so that there will be a slight margin of free or non-reinforced casing along either side of the latter and inside the edges of the slit in the stay plate, the removal and replacement of the inner tube will be rendered more facile. The exact form of the spring plates can be varied to suit any needs that may arise in the construction of the tire, and one plate can be arranged with an enlargement at one end of the slit for the passage of the valve stem. As the stay plates can be made comparatively thin the casing will not be materially or undesirably thickened in the vicinity of the slits. The presence of the slits in the tire does not increase the liability of the casing to unduly stretch either laterally or longitudinally. The self-closing slits have the advantage over the old laced slit besides that of convenience, that they present a smooth surface inside and out, thus giving the inner tube no chance to chafe on the casing.

### CHANGES AMONG RETAILERS

**Bard Branch Store in Westfield Closed—Burtis & Zimmerman Sell Out—Barden Co. Dissolved.**

W. L. Peeler has sold his bicycle shop in Bloomington, Ill., and will travel for A. G. Spalding & Bro.

The Bard Cycle company, which has had a branch store in Westfield, N. J., for two years, has closed the branch store and taken the stock to Plainfield.

A. W. Brock, of Alma, Mich., has sold out his business to J. McKay, formerly with Pinney & Horr, at Ithaca, who will keep a line of bicycles and a tin repair shop.

The bicycle business of Burtis & Zimmerman, at Asbury Park, N. J., has been bought by M. L. Ferris, who has been manager of the store for several years.

The Barden Cycle company, which has been in business for some years in Dorchester, Mass., has been dissolved by the retiring of F. J. Carle. E. Barden has secured a larger store and will remove his cycle supplies and add a line of sporting goods, retaining the firm name of the Barden Cycle company.

### The Rudge-Whitworth Reduction.

So many rumors have been current regarding the reduction of the prices of Rudge-Whitworth bicycles that the English company has found it necessary to call attention to the fact that as long ago as July, 1897, it adopted a system of net cash prices, and lowered the list of its standard machines to \$60 and its specials to \$80. The last reduction, which took effect November 18, places the retail price of the standard Rudge-Whitworth at \$50 and the special at \$75.

### New Jobbing House for Iowa.

A new stock company, with Chicago and Council Bluffs manufacturing houses as principal holders, will open for business as wholesalers of bicycles in Cedar Rapids, Ia., January 1. A stock valued at about \$15,000 will be carried, no retail business being done. A large storage room will be secured, with a business office in Dows' auditorium.

A custom to be binding must be shown to be universal in the locality and of long existence.

## MOTOCYCLE GEARING

### Graduated Speed Changes by Regulation of Power Supply Superior to Change by Gear Only

Since the explosion motor has not yet been shown in any form capable of reversing its direction of motion, wagons driven by this motor must always have a reversing gear with some form of clutch to throw it out of action, and at least two forward gears, one fast and one slow, each with its clutch. It is very common to arrange an explosion engine with three gear speeds forward and one gear speed backward, when used for wagon driving. Many very simple and ingenious arrangements of gearing have been devised for use in this connection, besides many others which were neither ingenious nor simple, and were violent and noisy in action.

Winton, with his foot-actuated governor, obtains a great simplicity of construction, using two forward speeds, one high and one low, and one low speed backward, and modifying these speeds by this governor action.

#### Three Different Conditions.

In order to successfully change the speed of a piston and cylinder driven wagon by reducing the power of the engine, it is evident that the engine must be considerably larger than would be needed if the speed of the engine could always be kept at its maximum. This feature, however, can hardly be considered as objectionable from any point of view, because it is always best to have a very large surplus of power available. With the explosion engine this large power can be maintained for any length of time, since it is only the best normal effect of the mechanism. With an electric motor or a steam motor the conditions are quite different. With the electric motor there is only a certain pressure and volume of current available; this may be used slowly or rapidly, but cannot be increased except by recharging. With the steam motor the maximum effect can be had for a short time only, as the boiler is not at all likely to be made large enough to supply the utmost demands which the engine may make upon it. But it must be remembered that the boiler has sufficient capacity for the normal effort of the engines, and that the extreme of power is only needed for a short time, as in passing through a stretch of very difficult road, or up a steep hill, or through a snow drift. It must also be borne in mind that this extra power demand on the steam boiler merely results in lowering the steam pressure for a short time, and does not in any way affect the range of the wagon, which remains unlimited.

#### The Docile Steam Engine.

Unfortunately, there are very few figures available in regard to the actual performance of steam driven wagons. In his 2:11 mile at Charles River Park, Boston, Stanley had a pair of cylinders 2½ inch bore by 3½ inch stroke, 130 lbs. of steam to begin with, and between 85 and 90 lbs. at the end of his run. His drivers made 720 revolutions to the mile, and they are geared down 2½ to 1, from the engine shaft. The total weight of the wagon and driver was about 665 lbs. The engines made about 830 revolutions per minute, but as the throttle was partly closed all through the run, it is impossible to tell what power the engines exerted.

With the same engines and gear, 2½ to 1 reduction and 150 lbs. of steam, Stanley ran up to the top of the hill in the hill climbing test, as has been previously detailed.

Here there is a piston and cylinder driven wagon with a fixed gear, chain and sprocket reduction, which can make a mile in 2:11, and can climb a hill which looked to be impossible for horses and was, in its final incline of 35 degrees, next to insurmountable for pedestrians. There is no clutch and no change of gear on this wagon, the speed of which is governed solely by moving a single small lever backward or forward.

#### Resources of Explosion Engine.

The Winton motor is as nearly the equivalent of Stanley's as is possible with a single cylinder explosion engine, otto cycle; this form of engine depends so largely on fly wheel velocity that its speed cannot safely be reduced below a certain number of rotations per minute. With the high and low gear and the foot governor, the Winton wagon obtains a great range of speeds, although the gear has but the two changes forward.

Duryea, with his 3-cylinder explosion motor, as made in his new Peoria model, approaches the constant torque of the steam engine, and can of course more nearly approximate steam engine effects. Duryea's gearing is therefore simple, while his three cylinders make a motor more certain in action than the single cylinder explosion engine.

It is a far easier, more certain, and less expensive matter, to change a valve opening than to change a pair of gear clutches, throwing one in and the other out of action, and this constitutes a great point of advantage for all of the piston and cylinder driven wagons, where the motor is placed under control of a hand or foot governor.

It is impossible to imagine a vehicle under more perfect control than the Whitney steam wagon, which has a fixed reduction gear, a pair of cylinders larger than the boiler can supply continuously with the throttle wide open, and is fitted with a link valve motion.

#### Backing Motion Required by Law.

In regard to the backing motion, American motorcycle builders will do well to remember that under the "Light Locomotives Act," which is the English motorcycle law, all motorcycles, no matter of what style or class, must be fitted with a backing motion before they can be allowed on the highway.

The steam engine reverses readily, and the steam engine can be run at as slow a speed as may be desired; these are two points of great advantage for a motorcycle motor. If practice proves that the Stanley automatic boiler can really take care of itself without troublesome repairs, then the steam engine appears to be the best road wagon motor so far shown.

The explosion engine has no boiler, and so avoids all the possibilities of trouble which belong to steam generators at large, and this goes far to make up for the inflexibility of the motor. It is not impossible to construct reliable clutches, and hard-block chains working with hard sprockets can be made to give a silent and satisfactory change of speeds.

From all this it would appear that the probabilities of successful use are in favor of changing motorcycle speeds by means of cylinder governing, rather than by a multiplicity of gear changes and clutches.

It also appears that Duryea has made a step in the right direction by increasing the number of his cylinders up to three.

The great variety of rates of travel obtainable by the steam motorcycles is one of the most strikingly favorable features of the action of those vehicles, and very strongly impresses observers previously familiar with motorcycles which change the rate of progress only by shifting gears.

HUGH DOLNAR.

### MAKING A GOOD SPANNER

Those Commonly Sold with Hubs and Hangers Useful for Rapid and Satisfactory Work.

Of all the small tools constantly needed by repairmen and riders and commonly poorly made, the spanner ranks first. Spanners of many kinds have been devised, but it is seldom that a workman has one which will answer the desired purpose in an efficient manner. More than a few repairmen can tell tales of minutes wasted and temper lost in trying to turn in or out some refractory cone or cup with a poorly designed spanner, and of finally resorting to the old blacksmith method of driving the cup around with a punch or small cold chisel and hammer. Several of the well known crank hangers are now so constructed that a spanner is a necessity in assembling them. For that reason it pays a repairer to make such spanners as will accomplish his work in the most efficient manner. Universal spanners have never been successful to any great degree, it having always been found necessary to make individual spanners for the different sizes of cups and cones to be turned. In the illustrations

is shown a simple spanner which can be used with cups or cones of the variety now common in hangers in which the spanner holes are on the periphery of the cups and lock nuts.

The first operation is to take a piece of steel about ¼ inch by ½ inch in cross section and start a curve at one end, also upsetting the end to form a rough teat, as shown at A in Fig. 1. With an end or socket milling cutter like that shown at B, the teat on the spanner piece is formed as shown at C. When only one or two spanners are to be made, this work might be done with a file, but if a quantity of spanners are to be turned out, it is best first to make a milling cutter that may be operated in an ordinary breast drill, thus enabling one to form all of the teats exactly alike and of the proper size and shape. Such end milling cutters of various sizes are at all events very handy tools to have around any kind of a bicycle shop or factory. With them any form of stud, large or small, which has to be dressed up projecting from a squared and level seat may be readily formed. The milling cutters are easy to make and inexpensive.

Returning to the spanner, the next operation is to bend it to conform to the cup for which it is designed. This can be best done when more than one spanner is to be made by rigging up on an iron plate a form comprising a thin disk of metal of the same size as the bearing cup for which the spanner is being made. This disk, D in Fig. 2, is bolted, screwed or riveted to the iron bed plate, after a hole has been drilled at some point in its periphery corresponding to the spanner

hole in the cup. A short way from the disk and about opposite to the hole a stud is erected from the bed plate. The spanner piece, G in Fig. 2, is then placed on the plate with its teat in the hole in the disk, D. A rod of some sort is inserted between the stud, E, and the spanner piece, and by bringing an inward pressure on its outer end it is made to bind against the spanner piece, thus holding the teat from slipping out of its hole in the disk, D. By pulling on the back end of the spanner bar the latter may then be bent to conform to the curve of the disk, and consequently of the cup for which it is intended. It should be bent far enough around to bring the point of tangency between its straight shank and the curved portion to a point nearly diametrically opposite to the teat. As will be seen from Fig. 3, the spanner when in use binds on

the cup at the points H and J, and so pulls the teat tighter against the cup hole the harder the lever arm of the spanner is pulled. The lever arm may be left as long as deemed necessary. A good, long arm is desirable for removing cups which turn with much resistance.

#### COMING MOTORCYCLE SHOWS

International Motor Vehicle Exhibitions for London and Berlin—Space in Ghent and Munich.

The Berlin International Automobile Show, promoted by the Central Europe Automobile Union will open in May. This exposition promises to be the most important motor show ever held in Europe and will be arranged and conducted similarly to the show in Paris last summer, everything being exhibited by classes as follows: motor bicycles, petroleum wagons, steam wagons, electric vehicles, etc.

In June another international motorcycle show will be opened in London, in which forty exhibitors have already applied for space.

At Ghent, Belgium, a provincial exposition will be held in June and July and the motor vehicle section promises to be very important. A special section will be reserved for heavy weight vehicles, and one of the stipulations for these wagons is that they must transport 2,500 or 5,000 kilograms at a maximum speed of twenty kilometers per hour. At Munich, a mechanic exposition will be opened probably in July, and motor vehicles will have a special department.

A cycle and motor vehicle show will be held in Lyons, France, from January 15 to 30.

#### To Try Army Tricycle.

A trial is to be made by the French army of a tricycle which weighs 121 pounds and has two quick firing guns placed in the rear, one on each side, weighing, with their fittings, 66 pounds. A thousand charges, with their cases, are also carried, bringing up the total weight to 270 pounds. Two riders are needed to propel the machine. Upon good roads, experts claim, this device will be very effective.

The cycle market in Germany is said to be overstocked with wheels of 1898 production. It is reported that there are fully 170,000 machines left unsold. This condition of affairs is ascribed to the reckless manufacture of bicycles by small firms, which had no outlet to dispose of their wares.

## ELECTRIC WAGONS IN SNOW

### MAKE A CREDITABLE SHOWING

With Wheels Wound With Rope Electric Cabs Negotiate Slush One Foot Deep—Horses Stalled.

The recent severe snow storm in New York and Boston gave the electric wagons a test which they have not had before in those towns.

The cab company, which now has 35 vehicles in use, wrapped its 5-inch pneumatic tires with chains or with ½-inch cord, so as to obtain a roughened tread, and found that their heavy wagons, when so equipped, would travel through snow of such depth as to keep many of the cab horses in the stable. These electric cabs have only 4 h. p., nominal, as their normal power, but by simply varying the controlled handle position they can exert 8 h. p., for an hour at a time, if needful, without injury or the slightest inconvenience. In deep, wet snow, such as lay on the streets of New York all the week up to Friday night, some electric cabs sent out with no "winding" on their tires, found trouble with wet slush over a foot in depth. But all the wagons with rope or chain on their tires did perfectly well so far as ability to handle themselves was concerned—better, in fact, than was expected. When it comes to such a depth of snow the weight of the vehicle seems to help its wheel-adhesion, and so make the wagon able to run much more strongly than might be anticipated.

The cab company expects to have the full hundred of their wagons in operation by January 15, 1899. The 35 now in use are busy all the time, and the company pay the drivers \$2.00 per day, and add a bonus after a certain per day-earning has been reached; for the month of November over half of the electric cab drivers had a bonus coming to them under this arrangement, and the month of December promises to be even better than November.

#### Delivery Wagons Continue Traveling.

Stanley writes that he saw a Riker electric delivery wagon advertising itself in fine form, by running at a good rate through the snow in Sumner street, Boston, where horses could only make headway with great difficulty.

The three Riker wagons operated by B. Altman & Co., proved much superior to horse drawn delivery wagons in the snow, owing to the fact that the electric vehicle can instantly double its power in a snow drift, while under the same conditions the horses are hardly able to propel themselves, let alone drawing a heavy wagon after them.

This good performance of the automobiles in the snow will be no surprise to those who can remember the Times-Herald contest, November 28, 1895. There had been eight or ten inches of snow before the day of the run, which had been cut up into all sorts of shapes by the wagon wheels, the weather being warm. The night of November 27 this hummocky road had froze up hard, and then about six inches of fine dry snow fell on top of it before morning of the 28th, making a smooth, slippery surface over the very rough road-bed below.

It did not seem possible that any four-wheeled wagon having only two of its wheels driven, could possibly make headway over such a track, but the event proved the ability of the wagons to negotiate a track of this sort without difficulty. The Duryea, and the Benz wagons, all gasoline engine driven, were able to propel themselves with ease, and though all had accidents, none of these were due to lack of adhesion of the drivers.

Probably the easiest way to gain adhesion in wet snow, is to wind the tires

with a small rope. This costs little, is quickly done, and is quite effective.

I do not understand that the Altman wagons had anything done to their wheels, nor did Stanley say that the wheels of the Boston wagon had been in any way given a rough tread.

This eastern-coast snow storm, which was very sudden and severe, and resulted in the loss of 250 lives in the many shipwrecks which it caused, may be said to have fully demonstrated the ability of very heavy mechanically driven wagons to propel themselves over any road where horses can draw a loaded wagon, or where a cab horse can travel with a cab.

On the occasion of the great storm in 1888, the streets were much worse than in this storm, and all horse travel stopped entirely for several days; indeed, business of all kinds was at a standstill, and many down-town stores were not opened for days together.

This present snow fall was not anything like that of 1888, but was still so severe that it is not likely to be equaled very soon, and the work shown by the electric wagons was extremely encouraging.

#### Trolley Lines in Trouble.

The electric street cars did not fare so well, not so much from want of driving power on the passenger cars, as from want of power and weight on the electric snow ploughs, which ran up on the snow drifts and whirled their wheels in vain attempts to move in either direction.

The underground trolleys also had considerable trouble, but not much, if any, more, after all, than the overhead-wire lines.

Taken altogether this severe early snow storm has given mechanical traction advocates great encouragement, and will materially advance the prospects of the electric delivery wagons, which were already favorites with their users, though many feared that the handsome vehicles would be able to do very little in snow covered streets. HUGH DOLNAR.

#### Electric Omnibuses in Paris.

Very satisfactory attempts have lately been made in Paris with electric omnibuses. Each carriage is moved by two motors of five horse-power each, a third motor, situated in front, being specially used for guiding. The vehicle weighs 8,000 kilogrammes, while the speed reached is twelve kilometers per hour. Next spring the regular service of these electric omnibuses will commence.

#### Motor Power for Artillery Transport.

The military technical committee in Vienna has made experiments with motor cars, carrying five tons load, for transporting cannon and ammunition. The trials have been successful and will be continued with a view to using motor power for all artillery transport.

Several bevel gear cutting machines are being shipped to Belgium by Brown & Sharpe, Providence, R. I. It is understood that these machines will be used by Belgium bicycle makers for cutting bevel gears such as are used in bevel gear chainless bicycles as they are now made in this country. Orders have also been received from Belgium for bevel gears already cut.

The automobiles which took part in the Paris-Amsterdam race have been sold at high prices, the average amount per vehicle being \$8,000. Their regular price was \$1,400 to \$1,800 each.

Russian cycle manufacturers have petitioned the government to levy the same tax on bicycle frames as on finished cycles.

**National  
New Ideas..**

ARE FOUND ON NO BICYCLES  
BUT NATIONALS—WE ORIGINATE  
THE IDEAS AND MAKE THE  
PARTS IN OUR OWN FACTORY.

When you sell National bicycles you are making a trade in your town on a distinctive, exclusive line of machines which  
**ARE SPECIALTIES.**

The old National rider buys a new National because he wants a National and not because he wants a bicycle. Practical business men know that that kind of trade is a steady money maker—If you want to get it write us. There's no cross competition in Nationals—every bicycle we make carries our trade-mark.

Andrae Cycles Never Disappoint.

**The Gap the Andrae  
Regent Fills**

The agent of a line of strictly high grade bicycles has always had one trouble—meeting the “low-priced-made-to-order-bicycle” competition. Cheap bicycles could be bought, of course, but reliable agents wouldn't sell cheap wheels—that they didn't know. ❁ ❁ ❁

**THE ANDRAE REGENT**  
(\$30.00 LIST)

is a cheap bicycle in price only. In every other way it is far ahead of the “made-to-order, slapped-together” bicycle. It is made in the same factory in which Andraes are made, on the same machinery, by the same men; as much Andrae quality is put into it as the price will allow. It's the best \$30 bicycle any agent will sell.

ANDRAE REGENTS CAN BE SHIPPED PROMPTLY NOW.

# INFORMATION FOR BUYERS

## MINER & FISK'S BALL ROLLER GEAR.

A driving gear of peculiar formation is being placed on the market by the Miner & Fisk company of Rochester. It is of the roller gear type, but has some features in common with the crown gear as well as with the bevel-gear. It escapes the requirement for great accuracy of gear adjustment and frame alignment of the bevel gear, by having the axes of all rollers at an angle somewhere near forty-five degrees with the pinion shaft. This should make the manufacture of the gears convenient and give a wide range of gear combinations without serious trouble for the maker. It goes without saying that the meshing of two gear

wheels of different diameters and both beveled at forty-five degrees cannot be on the principle of line contact without excessive friction being created. The rollers in this gear are therefore in the form of steel balls mounted to revolve upon pins. The steel balls of one pinion engage the steel balls of the other pinion, and both the balls in engagement accommodate themselves by rotation on their journal-pins to the requirements of the gear motion. The contact is always at a single point on both balls, but the rotation causes this point to travel over both balls in an S-shaped line, thereby distributing the wear, which on account of the purely rolling contact is very insignificant anyway. Side thrust is eliminated very largely by shaping each pinion with scalloped edges and mounting the balls in the scallops. By this arrangement the ball-rollers of one pinion are made to reach deeply into the engaging pinion so that the driving force is exerted in an approximately vertical line without marked tendency to push the two pinions apart from one another at point of engagement. The design of the gear has been experimentally developed to such a degree of accuracy it is stated that the inter-meshing is continuous and no backlash is noticeable. In roller-gears of any description this point is invariably one which must be proved by the practical running of the gear, as theory is unavailable, or at least too difficult to apply.

## BUFFALO HANGERS AND FITTINGS.

A complete line of frame fittings for both 28-inch and 30-inch wheeled machines, a one and a two-piece crank hanger and a new

expander handle bar fastening comprise in the main the line of goods which the Buffalo Cycle Supply Co. of Buffalo is introducing to the trade. The new company is composed of men of long experience in the bicycle business who are aiming at the economical production of up-to-date parts.

The capacity of the factory is rated as follows: 500 complete frame sets, 600 crank hangers and 1,100 handle bars daily. The hanger, which is here illustrated, combines an original sprocket design, oval section cranks and a two-part axle, the members of which are drawn together by a long bolt running the entire length of the complete axle and screwing into the hub of the left crank. The head of the bolt comes flush with the right crank and is turned by means of a square key used in connection with corresponding hole in the end of the bolt head.

## ELASTIC TIP CO. REORGANIZING.

The Elastic Tip Co. of Boston is now undergoing reorganization, which will doubtless be completed in a few days, when the same general jobbing business in all kinds of bicycle parts and sundries will be taken up again on the old lines. There will be no change in the management and all of the old traveling men will be retained. The catalogue for '99 is now in the hands of the printer and as soon as it is completed copies will be mailed to all bicycle dealers and earnest efforts will be made to push the business even harder than ever before. The line of parts and materials will be complete and as attractive as usual.

## PUSHING GESSLER LOCKS.

The Gessler bicycle lock shown in the accompanying drawing has won favor because it is an invisible preventive against theft. It is provided with a rubber expanding disk or collar which permits it to be fitted into the steering stem of any machine, new or old, in a few minutes without special tools. By the use of a key this lock fastens the front wheel at an angle to the frame, making the riding of the machine an impossible feat. The Gessler lock is very light, and,

being inside of the machine head instead of in the rider's pocket, cannot get lost and is always just where it is needed. It is manufactured by the Slaymaker-Barry Co., of Connellsville, Pa., and has been subjected to every practical test during the past two years that it has been before the public. As a special feature of their line for '99 the value of this device has been recognized by leading manufacturers, who are fitting them to their machines. John H. Graham & Co., 113 Chambers street, New York, have taken the sole agency for this lock and also for the Gessler bicycle holder and lock, illustrated and described in Cycle Age for September 15. Electrotypes of both these devices in several sizes are ready and will be furnished by Max Gessler, 133 Michigan street, Milwaukee, Wis., to any who wish to insert them in new catalogues.

## THE P. & A. AUTOMATIC GAS LAMP.

It has for some time been evident that a notable feature of the '99 season will be advent and general adoption of acetylene bicycle lamps as a desirable improvement in cycle sundries. Until last season gas lamps were in an experimental stage, and '98 was a probationary period which demonstrated their superiority and safety to the satisfaction of the riding public. Assured of a demand from the latter, lamp makers throughout the country are making energetic efforts to capture a large share of the trade and new gas lamps are being brought out in rapid succession. One of the latest is the one herewith illustrated. It is the product of the Plume & Atwood Mfg. Co. of Waterbury, Conn., having a western branch house at 199 Lake street, Chicago. The arrangement of the water reservoir, burner, carbide chamber and other parts is readily seen from the drawing. No solder is used in the

flame chamber, whose several parts are riveted or pressed together, and the water reservoir is separated from it sufficiently to allow a free circulation of air to keep the water cool. The burner is of the two jet type, producing the satisfactory fish-tail flame now being generally adopted. The top of the chimney is removable and the lens is held in place in the hinged front by means of an instantly removable spring wire. There are several new features in the construction of this lamp. The carbide chamber is proportionately very large and contains a thin metal cylinder attached to the screw-threaded base by means of the

common interrupted flange device. A number of small grooves are pressed in the lower end of this cylinder to admit the water at the bottom of the carbide instead of at the top, the water feed tube from the reservoir entering the gas chamber at the rear side and being prolonged to within half an inch of the bottom. A perforated cap covers the carbide cylinder. Any form of carbide can be used. The advantage in this construction lies in the fact that the exhausted ashes of the carbide can be quickly removed by detaching the metal cylinder from the base and removing the cap, when the ashes can be shaken out. The burner rises direct from the top of the gas chamber and provision is made for inserting a little wad of cotton to filter the gas before it enters the burner. A new form of water feed cock constitutes another new feature. It consists of a metal rod seated in a screw-threaded socket at the bottom of the reservoir and rising through the top. The socket has a central opening communicating to the feed water duct in the carbide chamber. Turning the rod by means of the thumb-screws at the top opens or closes this hole in the socket to admit or shut off the water. The metal rod is bored centrally and contains a spring actuated wire, which, when depressed by the finger pushes out of the end of the water duct any lime that may have collected to clog it up. The lamp attaches to the bracket by a ball and socket joint tightened by a thumb screw, and the bracket is made for both head and fork-side. The manufacturers claim the following exclusive advantages for the Automatic gas lamp: It is self-governing and requires no attention after being once charged and lighted; there is no restriction on the water supply, which is controlled entirely by the gas; it does not use any absorbents, wicks, blotting paper or pads, and has no parts to be replaced from time to time; it stores any surplus generation of gas and consumes it before generation takes place again; it has no gas joints to leak where the lamp separates for charging; the operating parts are made of hard rubber, and will last as long as the lamp; when lamp is open for charging, every working part is within view, and easy reach for cleaning.

## AMERICAN CYCLE CO.'S PLANT.

The building which will contain the complete manufacturing plant of the American Cycle Co. of Akron, Ohio, is fast being equipped and in the immediate future will be ready to handle a probable output of about 200 bicycles per day. Both the manufacturing and office departments of the plant will be lighted by electricity and all equipments are being put in in first class style. The officers of the company are: J. H. Warman, president and general manager; F. B. Rockwell, secretary; J. Benner, treasurer, and Carl Wenter, superintendent. The line of machines made, samples of which are already on the market, include ladies' and men's patterns of the Pathfinder, listing at \$50. These bicycles are built on stylish lines

with flush joints, arch crowns, large sprockets and other popular fittings and options. A special feature is the handle bar and seat post expander, in which the operating nut screws down into the post, the interior of which is threaded. The nut is turned by a suitable key fitting into a square hole cut in the top of the nut. The angles of the beveled plug and stem end are such that the stem expands against the outer tube for several inches, affording a large binding surface and preventing the bulging of the seat mast. A neat knurled hand nut closes the top of the post, rendering the adjusting means entirely invisible. A tricycle parcel carrier also belongs to the line and is offered at a figure intended to create a large trade in these machines which, being carried in stock, can be delivered promptly. Besides making complete bicycles the company will also market fittings.

**COLE & CO.'S SPECIALTIES.**

As a typical example of the development of the sundries and specialties manufacturing business, it would be difficult to make any better selection than that of G.

W. Cole & Co., of New York, who have recently moved into new quarters at 141 Broadway. When "Three-In-One" was first put in the market, it was no better than it is now, but its intrinsic merit was backed by judicious advertising and business methods that were sound and honest. It is in consequence of this that today this oil is a widely known articles, used exclusively by many gunners, typewriters and others, as well as bicyclists. A number of the largest makers use it in their factories, fill the oil cans of their tool bags with it, and recommend it to those who buy their bicycles. It has stood the test of time and made itself and the name of its makers famous. The history of the success of Three-In-One is the history of G. W. Cole & Co., a firm that is today one of the largest manufacturers of specialties that caters to the cycling trade. Next year the firm will be before the jobbing and retail trade as the sole manufacturers and sellers of more than fifty specialties. Recently it acquired control of a new toe clip invented by Bach which has patent hooks that keep it from shifting on the pedal. A hook with two forks to hang bicycles on in various positions was also bought in by Cole & Co. as soon as it was seen to be the best thing of the kind. Very recently Colonel Latimer of the Victor Mfg. Co. of Detroit, concluded to sell out because of his regiment being enlisted in the army. The Victor nipple wrenches,

baby carriers, spring seat posts and other articles were recognized by this shrewd firm as superior and in a twinkling the Victor products became Cole specialties. This New York house now practically controls the market on round nipple wrenches. It has an unapproachable line of luggage and camera carriers, toe clips, bicycle racks, lubricants and a score of other articles. Several of its 1899 devices are novel. One is a camera and package carrier that permits of the camera being removed from the carrier or the carrier and all taken

from the bicycle in a second and carried from the shoulder by a strap. A network carrier that weighs only ten ounces yet has a rigid frame of wire is another new thing in this line. A spring seat post with a double roller is not new, but for next year Cole & Co. offer one that has the obvious superiority of having the rollers on the inside of the post tube instead of outside. An article that is likely to be universally popular because of the want that it fills is a toe clip that is light and springy, will not rust and cannot shift its position on the

pedal. These requirements are all fulfilled in their Anti-Rust clips. They are made of spring brass and nicked and are turned out with double hooks that grasp the pedal plate and prevent tilting. Besides Three-In-One, "Pacemaker, the graphite that melts" is one of Cole's famous products. This is now being put out in collapsible tubes having a small brush with a handle that when fitted constitutes the cap. It is also furnished in tubes having a brush permanently fixed in the top through which the soft graphite is squeezed when it is desired to apply it. A new thing in connection with "Pacemaker" is a white preparation off it in which mica forms a component part. This also is put up in the clean and convenient forms mentioned. Last year Cole's saddles were introduced and although they were not "pushed" they made so many friends that they promise to be a leading line this year with this enterprising New York concern. A part of the success of Cole & Co. may be attributed to the care they take of their customers by liberal advertising in their territory.

**WOLFF-AMERICAN MODELS.**

R. H. Wolff & Co., Ltd., New York, offer for the coming season three models of single bicycles built on lines similar to those which have earned wide success in the past. The models, which comprise a racing machine, diamond frame road model, and a cycle for women, retain the main constructive features of last year, the notable exception being the fork crown, which this year is of the hollow arch pattern.

The drop frame has gracefully curved front tubes, and, like the other frames of the line, brings out the distinctive feature of Wolff-American frame designing—the giving of less rake to the seat mast than to the steering head. All frames have flush joints and D-shaped rear forks and stays. The well known eccentric chain adjustment, the flangeless hubs with self-oiling bearings, and the Wolff-American three-piece crank hanger, are also features of the '99 line, which includes besides the single machines two tandems and the Duplex cycle. All machines are fitted with the Wolff-American pedal, the special feature of which is the triangular foot rubber used. Steel plates on the inner side of the pedal side plates hold in place four triangular-shaped rubbers, which can be turned around when worn, bringing a new surface to the top.

**THE STEARNS CANADIAN FACTORY.**

In 1893 E. C. Stearns & Co. established a bicycle factory in Toronto, being the first of our firms to recognize the value of having a plant so located as to expedite deliveries and escape Canadian duties. The factory is equipped with modern labor-saving machinery, particularly adapted to the manufacture of bicycles, and in it are built each year the same models which are turned out at the Syracuse plant, employing during the season 200 to 250 men. The business of the Canadian factory has increased very satisfactorily each year. Thomas F. Byrne has just been appointed manager of the Canadian

factory. He was once chief shipping clerk, was promoted until he became general purchasing agent, and is familiar with the construction of Stearns bicycles and the methods employed in marketing them.

**IMPROVED ACETYLITE GAS LAMP.**

Samples are now out of the new pattern of the Acetylite lamp made by the Schumacher Acetylite Lamp Co., 84 LaSalle street, Chicago. In general appearance and construction the lamp is similar to previous patterns, the main external difference being the dropping of the milled head at the bottom of the carbide chamber. The new cartridge is of tin and is not pierced at its lower end, the gas delivery tube reaching only to the bottom of the cartridge but not passing through it as in former patterns. The passage of the gas tube through a tube running from the top to the bottom of the water reservoir and perforated near its lower end for the passage of water has been unchanged. The spherical combustion

chamber attached to the water reservoir by a bayonet joint, its ornamental chimney top, its flaring lens door, and the straight vertical cartridge chamber below the reservoir, give the lamp a neat appearance which is characterized by its similarity to some of the common forms of carriage lamps.

**GRANT'S NEW MILLING MACHINE.**

The new milling machine here illustrated has an apparent recommendation to bicycle manufacturers since its origin is due to John J. Grant, who has long been identified with the building of machine tools especially applicable to such work as is done in cycle factories. It is built by the Grant Machine Tool Works, Cleveland. One of the most striking features of the new machine is the manner in which the vertical adjustment of the spindle is accomplished. A cylinder mounted in the solid cast head of the machine is bored with an eccentric hole which is fitted with a phosphor-bronze sleeve in which the spindle runs. The bearing is tapered at each end for the taking up of wear, and lock nuts at the rear end prevent end-play. The eccentric is rotated by means of worm teeth formed upon its exterior, these engaging a worm on a shaft passing transversely through the head and fitted with a crank handle, which is seen

at the left of the machine in the illustration. The spindle can thus be set at any desired height above the table and when once adjusted is clamped solidly in position. The spindle is driven by a spur gear from the cone shaft, which is concentric with the eccentric cylinder, and therefore does not move when the spindle is moved for adjustment. At the inner end of the cone pulley is a small flanged pulley from which the feed drive is taken. Four changes of speed are provided for. The construction of the foot stock, as will be noticed from the

illustration, is solid and simple and allows the ready removal of the stock when not wanted. The table feed is managed by three handles. The lower handle at the extreme right of the machine is used for throwing the feed in or out of engagement, while the crank handle above it, also on the right end of the machine, effects the lateral adjustment of the table. The screw which it operates is graduated to thousandths of an inch. The crank on the front side of the machine near the right is used for making the longitudinal adjustment of the table. The spindle has the same hole as the Brown & Sharp No. 2 universal machine, and is threaded to take chucks or face mills. The extreme height of the center of the spindle from the table platen is 65-8 inches. The platen is 7 inches wide, 26 inches long, and the machine will take a cut 16 inches long.

#### CARLISLE LINE COMPLETE.

The building of first class racing machines, tandems, triplets and quads for '99 will be the special endeavor of the Carlisle Mfg. Co., West Jackson and Clinton streets, Chicago. The company's line includes all of the models necessary to answer the demands of discriminating buyers and every machine has been designed to have not only the common popular features, but as many original points in construction as possible. The Carlisle tandem which is built in both double diamond and drop front patterns, is a representative model of latter-day design in the west. The double diamond machine is distinguished by a cross brace tube running from the rear crank bracket, up through the frame to the middle of the steering head. The hanger drop is 2½ inches, with frames built from 20 to 24 inches high. Twenty-eight-inch wheels are used on the tandem though the single racing machine has the thirty-inch rear wheel which was a feature of the Carlisle models last year. Tandem weights run from 35 to 44 pounds. The equipment includes a carefully selected group of well known popular fittings. On both single machines and tandems the special Carlisle seat post and handle bar clamp is used and all machines have reinforced flush joints.

#### PEARSON HUB FORMING MACHINE.

An interesting cycle working machine is the hub barrel forming machine which has the manifold objects of preventing the work from catching and riding on the cutting-tool, of supporting the work against the thrust of the cutting-tool, of causing the forming-cutter and the cutting-off tool to reach the ends of their cuts at the same time and of relieving the delicate necking-tool of all unnecessary work, just allowing it to begin to take its cut in time to finish simultaneously with the forming and cutting-off tools. The designer of the lathe is Walter B. Pearson of Chicago.

The back rest comprises two slides which carry anti-friction rollers one of which

touches the work at the rear and the other on top. The slides bearing the rollers are so fixed in the supporting frame and so arranged with the operating means that the rollers are advanced toward the work at the same rate that the forming-tool is fed into the work. The rollers insure against the work being roughened by their contact as is liable to occur when stationary rests are employed and heavy duty is

required of the machine. The cut-off tool is supported upon the forming-tool slide and the connection between the two tools is made in such a manner that the movement of the forming-tool will impart an accelerated movement in the same direction. The driving connection between the forming-tool and the cut-off comprises a lever, one end of which is fulcrumed upon the fixed saddle of the forming-tool slide, and the other end of which is connected to the cut-off slide. A link connects the lever between its ends with the forming-tool slide. At the fulcrum of the lever a segmental gear formed thereon engages a rack formed in the tool carriage. Provision is also made for the ready disengagement of the two slides should it be desired to

operate them independently. The necking-tool is carried on a slide which is fitted to and movable in guides or ways formed in the horizontal back-rest slide and is operated by means of a segmental gear which engages a rack and is also secured to the hub of a pinion which engages a second rack formed on the back rest slide. The pitch diameter of the segmental gear is greater than that of the driving pinion. Accordingly the necking-tool slide will move faster than the back rest slide, so that by proper adjustment the necking-tool may be kept out of the work during almost all of the entire cut of the forming-tool, being advanced into its cut at a certain time and by its accelerated movement finishing simultaneously with the forming-tool. The necking-tool is thus subjected to light duty in keeping with its delicate construction. The drill which passes through an accurately bushed guide just before entering the work is driven directly from the back gear shaft of the machine. The construction of the lathe embraces several other minor points of novelty and improvement and is built as simply and compactly as possible.

#### ELASTIC TIP CO.'S INTERESTS BOUGHT.

B. H. Pratt, president of the Manufacturers' Agents & Supply Co., of Chicago, has been east for the past few weeks negotiating a deal which has just been completed whereby an eastern party has purchased the Elastic Tip Co.'s interests in the Chicago concern. The policy of the company for the coming season has not been fully decided upon, although it will continue in the cycle supply business and will be one of the largest houses in the west, catering for the jobbing and dealers' trade, both in the sundries and fittings line. The 1899 catalogue will be ready soon after the first of the year and will be mailed to all old customers and to new ones upon application.

#### CONSTRUCTION OF CRESCENT PEDALS.

Additional information regarding the construction of the Crescent pedals, illustrated in this paper December 1, is supplied by the U. S. Mfg. Co., of Fond du Lac, Wis., who make them, as follows: Crescent pedals are made of the best material by skilled laborers on automatic machines and special tools and are finely polished and nicked. The plates are in one continuous piece, and made of Singer, Nimick & Co.'s special cold rolled stock. The pins or axles are carbonized by the company's own method, giving a hard and practically indestructible ball race with a soft core, adding great strength and durability and leaving the threads considerably softer. The cones and cups are treated in the same manner, all ground and polished, making perfect ball races. A shoulder is turned on each end of the barrel and the turned ends are inserted into the frame and swaged over, making a strong and substantial joint, practically as of one piece of metal. Adjustments are made at the outer end. The outside ends of left hand pins are threaded left to prevent any possibility of tightening of the cones. Dust caps are provided at both ends of bearings. The corrugations give additional stiffness to the plates. The finish is nickel on copper. The Crescent No. 1 has large end bearings with 3-16-inch balls, weighs 15 ounces per pair and has the inner bearings close to the crank. The No. 3 is of the popular center bearing design, with large bearings and 5-32 inch balls. It weighs 14 ounces

per pair and is furnished in rat trap or combination. The ladies' crescent is a small, neat pedal for ladies' or juvenile machines, and can be used with either No. 1 or No. 3 men's. The design is a combination of the other two styles. The bearings contain 1-8-inch balls, weight is 12 ounces per pair; with rubbers, 15 ounces; furnished in rat trap or plates and rubbers, or with Straus universal rubbers. Pedal pins in all models have shanks ½-inch in diameter, with right and left threads, 20 threads to the inch. For foreign trade special sizes and threads are made. Pedals are adjusted and lubricated before leaving factory.

#### CHICAGO TUBE CO.'S SUPPLIES.

An advance catalogue of material and parts in sets complete for assembling frames, and of made-up frames and stripped bicycles is being issued by the Chicago Tube Co., 217 East Washington street, Chicago, which offers seventeen different styles of 1899 models. This house, which has been in the trade for five years and is known for its production of good goods at moderate prices, is also sending out a handsome sheet to the trade, illustrating its leading bicycles with specifications of full equipment. The company has no traveling salesmen, but its catalogue of bicycles, sundries, materials, bicycle tools, etc., is very complete.

#### KEROSENE MOTOR FOR SMALL POWER PLANTS.

The gradual equipment of repair and other small cycle shops always leads to the establishment of some kind of power for the driving of the lathes, drill, presses, grinders, etc. Power in such shops being required only at intervals, the steam engine has never been and doubtless never will be popular. Among other forms of power that allow the generating plant to stand still at times without waste, gasoline and similar engines have proven themselves very desirable. Lately the Daimler Mfg. Co. of Long Island City, N. Y., have adapted a pattern of their well known and efficient Daimler gasoline and gas motor to the use of kerosene as generating power. The new kerosene motor is constructed especially with the idea of furnishing economical and convenient power for small users. Its operation is simple and safe. The kerosene is carried from the supply tank to the vaporizer and to the burner at a slight pressure which is produced in the tank by a hand air pump. After the motor is started by giving the starting crank a few turns, it supplies itself with the necessary pressure by catching up a part of the exhaust in a pressure-receiving tube and carrying it to the supply tank. The necessary explosive mixture of gas and air is produced automatically in the vaporizer by the first downward stroke of the piston, air as well as fluid kerosene being drawn up and entering the cylinder as explosive mixture. The height of kerosene in the float chamber is regulated by a float valve so that the suction of the kerosene remains even. The further action of the motor

proceeds according to the well known principle of the Otto or four-cycle gas engine. The following upward stroke of the piston compresses the explosive mixture in the explosion chamber, forcing it out into the explosion cap, and this cap being heated by the burner, ignites the mixture, the expansive power of which forces the piston downward again. The next upward stroke of the piston forces the products of combustion from the explosion chamber through the exhaust valve.

The motor is made in sizes from two to thirty-five horse-power. The smallest size,

that which is most applicable to cycle repair shops, measures a little over four feet in height and occupies a floor space of but a little over two feet square. It is very compact and is so simple that an ordinary mechanic can soon learn to look after its welfare with confidence.

#### FORSYTH SHEET METAL ACCESORIES.

The Forsyth Mfg. Co., 308 Terrace, Buffalo, announces that its policy for '99 will be to retain as many of its old customers and gain as many new ones as possible by adhering strictly to the making of first class sheet metal stampings which will be sold at the lowest prices admitting of a fair profit. The line catalogued for the coming season includes such fittings and accessories as pedals, wrenches, spanners, coasters, brakes, brake spoons and clamping parts, lamp brackets, mud and chain guards and attachments, ball cups, etc. The Forsyth pedals are made in four patterns; mens ladies' adjustable and men's and ladies' with rigid frames. The adjustable rat-trap pedal here shown is proof against accidental loosening when once adjusted on account of the fact that suitable washers are placed between the plates around each adjusting bolt to keep the bolts from working loose. The parts and lines of the rigid pedals are the same as in the adjustable except that the foot plates being made in one piece have slightly different cuttings in their faces. In the men's pedals 7-8-inch straight steel barrels contain ball cases each taking eleven 5-32-inch balls. One of the company's novelties is the rear fork end fitting.

This is made from one piece of 12-gauge steel with a cup-shaped pressing upon one side through the walls of which is bored and tapped a hole suitable for the reception of the chain adjusting screw. Thimbles slip onto the branches of the piece to form seating for the fork and stay tubes.

#### CARBORUNDUM IN TIRES.

A new method of rendering pneumatic tires puncture proof is made use of by the Milwaukee Patent Puncture Proof Tire Co., of Milwaukee, Wis. The tires made by this concern do not differ from others except in the use of carborundum, a mineral product from which an attempt was made several years ago to manufacture diamonds, but which process proved too expensive to be commercially successful. This substance is forming the tire the tread is built up of five gunpowder and are extremely hard. In forming the tire the tread is built up of fine piles of fabric, interposed between which are three layers of carborundum, so thin as to be scarcely perceptible in the cross section. The side walls of the tire are of only the usual thickness of two layers of fabric and the inner and outer walls of rubber, so that any resiliency lacking in the tread is contributed by the elasticity of the side walls. The special quality that makes the carborundum suitable for puncture proofing material is the extreme hardness and sharpness of the grains which cut into any metal that penetrates the outer skin and by the friction arrest further progress. As the mineral is also harder than glass it prevents cuts as well as punctures by tacks, pins, nails, etc. So small a quantity is used, however, that a pair of these tires is not noticeably heavier than the ordinary road tire. The Milwaukee company has during the past

year placed a large number of these tires in the hands of manufacturers, agents, and riders for practical test by a season's use and it now has on hand a most convincing budget of testimonials from all these proclaiming the positive non-puncturability of the diamond-tread tire. Thoroughly convinced of the merits of its goods and backed up with the testimony of the many who have tried them under all conditions, the Milwaukee Patent Puncture Proof Tire Co. intends to push their sale vigorously for next season.

#### AMERICA AND ORIOLE MODELS.

The David Bradley Mfg. Co., 73 Fulton street, Chicago, lists for the coming season two grades of machines. The America, which is of improved design but is still similar to its predecessor of the past year, retaining the truss frame feature, sells for \$50, while for a popular model selling at \$35, the Bradley company is offering the Oriole, made in both man's and lady's patterns. The Oriole is a flush joint machine of stylish form and with standard equipment. Several colors are offered and a generous line of other options. It is marketed as an honest and reliable machine avoiding extravagant features and intended for all round service.

#### LARGE CAPACITY FOR WALDORF CYCLES.

The Waldorf line of medium grade bicycles with which the Eclipse Bicycle Co., of Elmira, N. Y., will supply all the demands of its customers for machines of lower price than the regular Eclipse, is being made in Oneonta, N. Y. The company has secured the large plant formerly occupied by the McKammon Piano Co., with 300,000 square feet floor space, and has placed W. H. Ives, who has made bicycles for several seasons under the style of the Empire State Cycle Co., in charge of the factory. The facilities are sufficient for a very large production.

#### CAUTIONED AGAINST INFRINGEMENT.

The Safety Oiler Co., 65 Nassau street, New York, has just sent out to the trade a circular letter warning jobbers and dealers not to handle an oiler similar to the one made and sold by the above company which may be offered the trade and which the Safety Oiler Co. alleges is an infringement of the Hirsch patents owned by it. As soon as the decision of the courts is made known the company announces it will take steps to protect itself against all who in any way have handled the infringing device and sue for an accounting.

#### TRANSFERS EXTENSIVELY CATALOGUED.

The Meyercord Co. of Chicago announces that its line of transfer decorations will be catalogued by two or three times as many jobbers as have catalogued same heretofore. Most of the important jobbers in the United States will catalogue the full line of designs. The company distributes electrotypes and samples for salesmen free to jobbers. In addition to the line of decalcomania decorations the company makes nameplates for the jobbers to sell to the small trade.

#### TRADE NOTES.

Arrangements have been made by which Daniels & Fisher, of Denver, become distributing agents for Stearns bicycles in Colorado and Wyoming, as well as retaining the retail agency in Denver. The firm will carry a large stock of bicycles and parts, so that the trade within their territory may be promptly supplied.

The Sunbeam twisted or drill shaped spokes made by the American Specialty Mfg. Co. of Hartford, Conn., are meeting with a growing demand. The attractive, glistening effect lent by them to the wheels of a bicycle has won them many admirers.

A. S. Noonan, of Rome, N. Y., manufacturer of cycle shop tools, etc., has secured the exclusive right to manufacture the Conn cycle chain cleaner, formerly made by J. C. Conn, the patentee, Ilion, N. Y.

#### FROST'S NEW GEAR CASE.

Is Wholly of Metal Yet Noiseless—Rear Wheel Removed Without Detaching Case.

This gear case shown in the accompanying illustrations is the result of two years' experience of its inventor in developing and marketing gear cases for American bicycles. Probably no other man in this country has had so broad opportunities as W. H. Frost has enjoyed for the practical study of the enclosing of running gear. Supplying manufacturers, jobbers, dealers and riders, fitting cases on over 200 makes of bicycles and in constant communication with the users,

every phase of the question has been brought before him. The original Frost gear case manufactured by the Frost Gear Case company for two years proved to riders that a gear case, even if somewhat difficult to attach and separate, and with some perishable parts, may be made to do its work perfectly when attached. About 8,000 of this older pattern are now in use. The shortcomings in attachment, however, and the criticisms and wants of the different branches of the trade, carefully collected and studied by Mr. Frost, suggested a new construction that should please everybody, resulting in the invention herewith described. It is superior to the older forms, especially in allowing removal and replacement of rear wheel by the rider without lengthy instructions. The principle of its operation is self-evident and the operation

is simple. The chain is always in sight and easily accessible. It has no perishable rubber parts, is light in weight, noiseless, and susceptible of quick alignment if displaced by accident. Both sides of front sprocket may be readily uncovered. Another valuable feature for commerce is that it can be decorated by manufacturers to match varying grades of bicycles.

The case consists of four principal parts, as shown in the first illustration. The chain runs telescope with the ears on front box and the two parts of front box fit together with a groove and knife edge joint, as do also the two parts of the rear box. These joints packed with rubber are water and dust tight, and destroy all resonance in the case. Around the crank hanger is placed a narrow rubber band about 1-16 inch thick. The two parts of the front box are brought together by the screws and the edges of the opening are set singly into the rubber band, making a tight joint. The clamps binding the chain runs and front box together are also rubber packed, and the joints are sufficiently yielding to allow of separating the rear box, as in the first cut. In order to make it feasible to remove the rear wheel when a sprocket of large diameter is attached, the rear of case is slotted, as shown in the second illustration, and the slot is closed by a rubber strip covered with a flexible strap fastened to the lower part of rear box and secured by a thumb nut to the upper part of box.

The rear support of the case, which is held on by the axle nut, is a metal strip, whose ends are turned at right angles and are slotted to receive the screws that bind it to

the case. The slots allow for quick and exact alignment of the case at the rear, and also for the complete removal of the rear support when rear axle nut is off. An adjustable system of clamps that are adapted to various sizes of tubing and adjustable as to length attach front box to frame. The ends of these braces are slotted and allow of alignment of front of case.

Noiselessness is secured by a novel arrangement of pads in the chain runs. A mica window in the lower chain run gives a constant view of the chain, and may be unscrewed for the application of lubricant. W. H. Frost, the designer of this much improved case, desires to open negotiations for having it manufactured. His address is 2933 Prairie avenue, Chicago.

## Decalcomania Name Plates...

## and Their Ever Increasing Use

**W**ITHIN the past few weeks there has been a marked increase in the demand for transfer name plates for bicycles. Quite a number of the large manufacturers and jobbers have placed orders with us. Nearly every manufacturer is gradually tending toward the use of a trademark, that is to be noted by an inspection of the '99 catalogues now being distributed to the trade. Manufacturers who have been figuring for name plates and receiving designs, realize that to bring out a name plate in nice style, colors are necessary. Of course the use of a metal name plate precludes the use of colors. Naturally the manufacturer who is adopting a trademark wants to see it in first class style. A transfer is really, therefore, the only plate he can use to secure a perfect blending of colors in his trademark.

The fact that the use of color is of course, the first and most important point in favor of the use of a transfer, is not all there is in favor of the transfer. There are other important advantages in the use of such a transfer; you can secure a finer design for less money than with a metal name plate; a metal name plate can be taken off by any dealer or rider, in fact is jerked off, or falls off of most wheels after being ridden any length of time; a rider cleaning a wheel finds the cleaning rag constantly catching in the name plate. Then again the metal plate naturally tarnishes very easily and presents an exceedingly shoddy and dirty appearance, no matter how bright and flashy it was when shipped from the manufacturer. It shows up very dirty after a short time under the average rider's care. On the other hand, the points in favor of a transfer name plate are first and foremost, the beauty of the design; as the name plate is transferred under the enamel it remains bright for a long time, then again the transfer lying under the enamel, close to the surface, presents no obtruding edges, and cleaning the frame is made easier. The transfer name plate cannot be shaken or taken off, without marring the finish, which no rider will do.

A constantly increasing field for the use of a transfer name plate, is that of the dealer and jobber. We are selling large numbers of name plates to small dealers and jobbers, who have had designs made, and instead of "Made By" in the name plate, they have used the words, "Sold By" or "Repaired By". This is an excellent advertising medium, and we should like to hear from all the jobbers and dealers. We will submit designs free of charge, and further more will accept orders for from fifty name plates, on up.

Write for samples and prices, and also for catalogue of our '99 line of high art frame decorations.

# THE PASTIME AND SPORT

## MILLER'S DOUBLE VICTORY

Chicago Gripman Wins Six-Day Race and Becomes a Happy Groom—A Pretty Romance.

New York City, Dec. 12.—Cupid, Mercury and Hymen made Madison Square Garden a temple unto themselves on Saturday afternoon, when C. W. Miller won for himself a bride, the world's 142-hour championship, \$1,700 in purse money and various valuable incidental emoluments at the conclusion of the six-days' grind.

Pat Powers had developed an unquenchable match-making mania early in the week and set out forthwith to overcome the seemingly insurmountable obstacles to his suddenly inspired scheme of wedding Charley Miller to his pretty Chicago sweetheart, Miss Genevieve Hanson, who had been applauding the conqueror of her heart all the week, there in the hour of his triumph.

Just before 5 o'clock in the afternoon the brass band "choir" broke into the wedding march and a "congregation" of five thousand into cheers. The bride in a bewitching dove-colored, fur trimmed, afternoon costume, leaning on the arm of Arthur Gardiner, the best man, wended her way through a crowded aisle to a box decorated with flags and flowers—the altar of the ceremony. Across the home-stretch were drawn up the eleven other contestants, who had called off the cycling contention for the moment in honor of the occasion.

Then came the gallant groom in afternoon garb of flowing bath robe, soon cast aside and leaving him standing in full racing togs of many colors. Alderman Wentz performed the ceremony with due solemnity and then the great throng burst into cheers as the groom gallantly saluted the cherry lips of his bride. "Dutch" Waller made a wild dash across the track, shook Miller's hand and landed a resounding smack on Mrs. Miller's mouth. Arthur Gardiner claimed a best man's privilege and Tom Cooper responded readily to the bride's invitation to do likewise.

Miller quickly mounted his bicycle and rode off on his wedding journey, leaving his bride behind thus quickly deserted. His ride from here on was to down the records. The old figures—1983 miles—were wiped out at about 6:30 and at 7:41 he had completed his 2,000th mile.

The last hour the twelve men still in the race were on the track, all shaved and dressed in clean suits for the occasion, and all marvelously free from signs of the "torture" so vividly portrayed by the yellow journals. At 10 o'clock the outfit paraded in the order of the finish and were cheered separately. The score was as follows:

Miles.	Leader.	Time.
100	Frederick	4:49:00
200	Miller	10:04:00
300	Waller	15:30:00
400	Pierce	20:54:32
500	Pierce	27:29:00
600	Pierce	33:34:00
700	Pierce	40:06:00
800	Pierce	46:47:00
900	Pierce	54:31:00
1,000	Miller	61:05:30
1,100	Miller	68:50:00
1,200	Waller	76:42:00
1,300	Miller	84:34:00
1,400	Waller	91:48:00
1,500	Miller	99:28:00
1,600	Miller	105:55:00
1,700	Miller	113:39:00
1,800	Miller	120:51:00

The record by each 100 miles is:

Miles.	Leader.	Time.
100	Frederick	4:49:00
200	Miller	10:04:00
300	Waller	15:30:00
400	Pierce	20:54:32
500	Pierce	27:29:00
600	Pierce	33:34:00
700	Pierce	40:06:00
800	Pierce	46:47:00
900	Pierce	54:31:00
1,000	Miller	61:05:30
1,100	Miller	68:50:00
1,200	Waller	76:42:00
1,300	Miller	84:34:00
1,400	Waller	91:48:00
1,500	Miller	99:28:00
1,600	Miller	105:55:00
1,700	Miller	113:39:00
1,800	Miller	120:51:00

1,900	Miller	129:30:00
2,000	Miller	139:41:05

The 24-hour record was broken by Pierce, 457 miles 176 yards; the 36-hour by Pierce, 638 miles 704 yards; the 48-hour by Pierce, 812 miles 704 yards; the 120-hour by Miller, 1,786 miles 1,584 yards, and the 142-hour by Miller, 2,007 miles 4 laps.

From the start on Monday morning Miller had 9¼ hours' sleep, Walter 8½ hours, Pierce 14 hours, Albert 14 hours, Gimm 8½ hours, Lawson 10 hours and Aronson 18 hours. Each of these was off the track from three to six hours more than the time spent in actual sleep. Albert spent the longest time off the track. In the 142 hours he was absent 22 hours.

Fred Schinnerer quit long before the end of the race upon the request of his wife and the advice of the physicians. Many of the other contestants were ordered off the track by the board of health at the suggestion of the examining doctors. Lawson, who showed the effects so badly in the middle of the week, recuperated remarkably and finished in sixth place.

It will be noted that there is a strange absence of the names of the French, Swiss, Australian and other foreign riders among the leading six at the finish.

## Bald's Company Goes Broke.

The "Twig of Laurel" company, in which E. C. Bald played the star part, has "gone broke" on the road. It had been out only a month and had been playing one-night stands until it reached Boston, where it was billed for a week. Whether the Bostonians failed to appreciate the fine points of the play, or there was some reason dating from further back, is not quite clear, but the money failed to hold out and the troop was paid off and returned to New York. The Luescher-Heffron company of Syracuse, which was backing the show with Bald as the other partner, it is said, lost in the neighborhood of \$8,000 on the venture. There were twenty-three high salaried persons in the company. It is possible the play may be rewritten and the company started out again the first of the year if any capitalists can be found to back it.

## Paris Cycling and Motorcycle Income.

In the sporting budget of Paris just prepared for 1899, it is estimated that one-twentieth of the tax on motor vehicles will bring an income of \$8,920 and one-quarter of the bicycle tax \$17,500 into the city treasury. The bicycle stand at the Palais de la Bourse is cited to return \$300, the buffet of the municipal track at Vincennes \$300 and the track itself \$2,000. Thus the city anticipates an income of \$28,020 from cycling and automobiles. In 1898 the quarter of the bicycle tax alone returned \$28,000 to the city treasury. The expenditures that Paris will make for cycling are \$2,000 for the Grand Prix du Paris and \$460 for service at the municipal track.

## Cycle Paths in Belgium.

Cycle paths are reported to be in more general use in Belgium than in any other country, though little information regarding them has reached here. They are constructed of stone, brick or cinders out of the proceeds of a small tax that is levied on all cycles and are very general throughout the country. Their character is said to be so good as to induce many Europeans to tour through the sections where they are found.

## OPPOSITION ORGANIZED

National Cycling Association Formed to Control Racing in the East—Adopt Constitution Later.

New York City, Dec. 8.—Opposition to L. A. W. racing control took formal and aggressive shape at a meeting of representatives of tracks, race promoting clubs and the American Racing Cyclists Union here to-day. An organization was formed, to which was given the name of the National Cycling Association, memorable to old timers as the title of the cash prize league, which first undertook to formally promote professional racing. The tracks and organizations actually represented were the Park, Washington, D. C.; Hills Grove, Providence, R. I.; Hillsdale, to be built at Belleville, N. J.; Waltham, Waltham, Mass.; the New Jersey, Vailsburg, N. J.; Ambrose Park, Brooklyn, N. Y.; American Cycle Racing Association; American Racing Cyclists' Union; Kings' County Wheelmen, Brooklyn, and Quill Club Wheelmen and Riverside Wheelmen, New York. Letters expressing a desire to join in the movement were read from the managers of the following tracks: Athletic Park, St. Louis; Colosseum, Baltimore; Newby Oval, Indianapolis, Ind.; the athletic track, Buffalo; and Tioga, Philadelphia.

J. D. Lasley, Washington, D. C., the temporary chairman, read an address setting forth the situation. This was followed by a long discussion and review of racing conditions, in which every one present freely gave his experience and views with regard to league mismanagement of racing matters.

Resolutions were then passed declaring that a new association should be formed and that the National Cycling Association was then and there organized.

As the representatives of the promoting clubs and of some of the tracks were not authorized to bind their organizations before reporting to them, it was decided that the officers elected should fill temporary positions until the adoption of a constitution and by-laws at an adjourned meeting to be held at the Fifth Avenue Hotel on January 4.

The election was practically unanimous and resulted as follows: Charles A. Johnson of Buffalo, N. Y., president; C. D. Bloemecke of Vailsburg, N. J., first vice-president; Fred House, Harlem Wheelmen, New York City, second vice-president; A. G. Batchelder, New York, chairman of board of control; R. F. Kelsey of Hartford, Conn., chairman of district A, embracing all of New England; Walt. Wilson of Buffalo, N. Y., chairman of district B, embracing New York and New Jersey; J. D. Lasley, chairman of district C, embracing the southern middle states; George Bahl, Jacksonville, Fla., chairman of district D, embracing the southern states; and Charles P. Root of Chicago, chairman of district E, embracing the northwestern states. Tom Cooper of Detroit was elected a member of the board, representing the interests of the A. R. C. U. A committee on constitution was appointed, consisting of A. G. Batchelder, C. D. Bloemecke and Jay Eaton.

The constitution and by-laws outlined in Cycle Age of December 1 will be revised and submitted for adoption at the next meeting.

The meeting lasted nearly four hours and every point of the situation received serious discussion. There was remark-

able unanimity as to the general plan proposed, though there were differences as to the details.

### KEENAN'S BOOM LAUNCHED

Pittsburg Man is Unanimous Choice of Pennsylvanians—State's Delegates Uninstructed.

Philadelphia, Dec. 12.—At the annual meeting of the board of officers of the Pennsylvania division last Saturday the boom of Vice-Consul Thomas J. Keenan, Jr., of Pittsburg, for next president of the L. A. W. was officially launched by a resolution offered by Mr. Knapp and seconded by George D. Gideon, presenting his name as Pennsylvania's candidate. Mr. Keenan was present, and was evidently gratified when the resolution was unanimously adopted.

Among other interesting items in Chief Consul Boyles' report was the showing made in the matter of legal protection to League members during the year, when of the 277 cases handled but 11 were decided adversely.

Secretary-Treasurer Collins' report showed that the Pennsylvania division, unlike those of Massachusetts, New York and other big states, had met all its financial obligations and still had a snug balance on the right side of the ledger.

The anticipated resolution in favor of the League abandoning racing control was not forthcoming, and the forty-seven Keystone State delegates will go to Providence uninstructed on that question.

For the first time in the history of the National Assembly Pennsylvania will have a larger delegation than New York—47 as against 46. A majority of the total vote will be 132, which augurs well for Keenan's chances, while to carry an amendment to the constitution 176 votes will be necessary, which seems to indicate that a motion that the League abandon the control of racing will have an exceedingly hard time in passing.

### Minnesota Votes for State Aid.

Minneapolis, Dec. 12.—One of the questions before the voters at the recent election in this state was a proposed amendment authorizing state aid for building wagon roads. The returns are all in, with the exception of Watonwan, St. Louis and Lyon counties. The vote stands 65,041 for the amendment and 36,466 against. The question has been raised, however, whether or not the amendment carried, as the vote in favor of the measure is short of a majority of all the votes cast in the election. A. B. Choate, the attorney and one of the leading L. A. W. members of the state, holds that it has carried. The act submitting the measure follows the language of the constitution as to the necessary majority, and reads as follows: "If a majority of the voters present and voting shall vote in favor, etc., it shall take effect and

force, etc." This language, Mr. Choate holds, has been construed by the Supreme Court in a case where the amendment to the constitution submitted at a general election received less than half the number of votes cast for governor, which held that since the amendment received a majority of the votes of those who voted on the measure, it was immaterial that the votes in favor of the amendment were not a majority of the votes cast on some other question submitted at the same election.

### BANKER TAKES LARGE PRIZES

Popular American Wins at Montpellier and Breziers from Second Raters—Shows Good Form.

George Banker has shown an evident return to good form by winning several big first prizes recently, though the victories lose somewhat of their honor by the fact that he was not pitted against any of Europe's best men in the races. He won the 2,000-meter Grand Prix at Montpellier, France, by more than twenty lengths, November 24, on a slippery track. Tommaselli ran second and Cambelles third. Banker took the lead from Cambelles at the bell and sprinted away splendidly on the last turn, much to the surprise of Tommaselli.

The first prize of 1,000 francs in the Grand Criterium du Midi run at the big race meet in Berziers, France, November 27, was also won by Banker. In the first heat of 1,000 meters the American led all the way and won easily by half a wheel. Tommaselli and Geo qualified in their heats and Leynard qualified in the consolation heat. In the 3,000-meter final Banker took the lead a lap and a half before the finish and balked every attempt of his opponents to jump him, but in the sprint Tommaselli made a desperate effort and ran the American almost a dead heat at the tape.

Banker also won the 333-meter heats against time in :24 3-5, with Tommaselli second in :25 2-5.

Geo and Merle defeated Banker and Tommaselli by a wheel in the 3,000-meter tandem event in 9:30.

### NEWS IN BRIEF.

Buffalo is making strenuous efforts to secure the League meet next summer.

A. A. Zimmerman does not intend to return to the track, but will be joined by his brother-in-law, Joe McDermott, in the manufacture of bicycles.

The Touring Club of France, during the year ending September 30, 1898, added \$32,904 to its treasury. Receipts of the club were \$119,574 and expenditures \$86,669.

John E. Wing, San Jose, Cal., on December 4, broke Wilbur Edward's quarter-mile record of :24 2-5 made in '94 on the straight away of a mile horse track. Wing's trial was made on a circular track and his time was :24 flat. Other records secured by Wing were the third-mile in

:34, the half in :52 2-5, and the two-thirds in 1:11 2-5, all previously held by George P. Fuller.

Some of the New York women members of the League have recommended to Chief Consul-elect Belding the formation of a woman's L. A. W. consulate in that state.

The Associated Cycling Clubs of Montreal has forwarded an application to the C. W. A. for the Dominion meet, to be held in that city under the auspices of the clubs in 1899.

Charles Barden, the once celebrated English record man, has abandoned the track and will soon open a soft drink and paper stand in his little town of Putney.

It is reported that two new tracks will be built in New York next year to be run under League control in opposition to the Manhattan Beach and other tracks now blacklisted and used by the N. R. C. W.

Miller says he will probably enter no more six-day races, but will go after world's records behind motor pacing with wind shields in Europe, where he also hopes to meet Huret, Rivierre, and Cor-dang.

The seventy amateurs who competed at Madison Square Garden have been suspended by Chairman Mott, who also fined the competitors in the six-day race \$50 each and placed the track on his blacklist under \$1,000 fine.

An effort has been made in Hartford, Conn., to govern the riding of bicycles to fires, but the committee to which the subject was referred reported that the matter was covered by a state law controlling nuisances which could be enforced to remedy the trouble.

Tim Hurst of St. Louis is seeking to make arrangements for Powers and Brady, who managed the Madison Square Garden race, to conduct a six-day go-as-you-please in the Missouri town some time in January. Plans for the Chicago affair are said to have fallen through.

Eros and Prisini, the Italian riders who started with Momo for South America on November 14, suffered so with sea sickness that they hastily debarked at Barcelona and declined to proceed, forgetting baggage and everything in their hurry to get on land again. Momo continued his trip to Buenos Ayres.

While in Paris Jimmy Michael said to a reporter for Le Velo, "Two canards have been constantly going the round of the press and I want to put an end to them. First of all, I have never been married and have no intention of getting a wife just yet. Secondly, Tom Linton and I are the best of friends."

Charlie Hadfield and W. F. Sager have tied up for tandem work this winter and are planning to attempt a mile a minute on a road down one of the Orange mountains in New Jersey, across from New York. Both are expert on multicycles and claim to have the nerve to ride that fast, if the wind is favorable to the undertaking.

George D. Locke, C. W. Mears, F. D. Valkenberg and Wallace Sherwood, respectively, chief consuls of Illinois, Ohio, Wisconsin and Indiana, held a conference in Chicago Sunday to discuss plans for recruiting the division membership and other matters pertaining to division affairs. Informally the chief consuls declared themselves in favor of the continued control of racing by the League.

## EXCLUSIVE TERRITORY

### To Bi-Gear Agents for '99

We will make a good proposition to responsible dealers. Apply for the agency before others get in ahead.

**BI-GEARS REDUCED TO \$15.00**

The price has been reduced to \$15, which is \$5 less than heretofore. We will exhibit at space No. 94, New York Cycle Show, and be pleased to meet old friends and form new ones.

"Sure Thing" Tire Mender, rubber band kit. Postpaid, 10 cents.

**Brown-Lipe Gear Co., SYRACUSE, N. Y.**

## The Oldest Handle Bar Manufacturers in Business

Don't be misled to use bars that are unknown and of inferior quality when you can buy the

**Ideal Adjustable and Internal Binder Bars**

for the same money. Our bars are made of the best seamless tubing, and the stems of one-piece forging. All styles. All bars heavily coppered before being nicked. Guaranteed the best finish and most perfect bar made. Get our prices and circular for '99.

**IDEAL PLATING CO., 7 Appleton St., Boston, Mass.**

# THE CYCLE AGE

## AND TRADE REVIEW

VOL. XXII—No 8.

CHICAGO, DECEMBER 22, 1898.

NEW SERIES No. 57.

### FAIL TO DISSOLVE THE BOARD SEVENTEEN STOCK VOTES SHORT

Another Effort Will be Made Early in January to Disband the Association.

New York City, Dec. 20.—This was the day appointed for choking the life out of the National Cycle Board of Trade. The strangulation was vainly attempted.

For the rope slipped.

Hangman and doctor and jurors were punctually on hand. The pretty stenographer wept. The amiable secretary took on an appearance of unutterable woe. The unobtrusive bookkeeper nervously fingered his petty cash. The massive frame of the president heaved with such sighs as are suited to dissolution. The sprightly office boy was as dejected in mien and air as a chicken with the pip.

All were there to mourn.

#### Six Stockholders Were Present.

Six radiant stockholders lightened the general gloom by their presence. They had heard of the matinee performance and journeyed from Jersey and the lower end of Broadway to see it. There was no throng, no tumult,—there were no flowers save those of speech.

"Call the roll, Mr. Secretary," said the headman, stifling a sudden gust of grief. "I guess we're all here," was the response.

"Then lock the doors," was the rejoinder.

It was moved and seconded that the doors be locked, and the motion prevailed. Accordingly the doors were locked.

Then it was moved and seconded that the Board should forthwith be dissolved.

"Count the vote, Mr. Secretary," said the president, as the tears coursed down his sunken cheeks.

#### Short of Two-Thirds Stock Vote.

"Seventeen shy of the necessary two-thirds," came the answer.

The blow almost killed Harry. Harry is the office boy. But joy seldom kills. Harry is still on the pay roll.

It was then decided that on January 3 in the next year of grace another hack would be taken at the Board. The failure to secure sufficient proxies, despite the most vigorous efforts on the part of the secretary and the members of the executive committee, has transformed what was designed to be a tragedy into a roaring comedy.

#### Want Revenue Tax Removed.

Washington, Dec. 19.—There is a general desire among manufacturers and business men that the stamp taxes required on bank checks, drafts, certificates of de-

posit, bills of exchange, and promissory notes, by the war revenue act, should be repealed, and a determined effort will be made during the present session of Congress to bring about this end. Representative Lloyd has introduced in the house of representatives a bill to repeal that portion of the act covering these forms of exchange paper, and the ways and means committee has the measure under consideration, and it is thought that the committee will recommend its passage.

#### NEW ENGLAND DEALERS CHEERFUL

Trade Conditions Have Improved and Good Demand for Chainless Machines is Anticipated.

Springfield, Mass., Dec. 19.—Dealers in such New England centers as Worcester, Springfield, Hartford and New Haven are unanimous in the opinion that the chainless will have a good sale next season. Because of the numerous hills in and about Springfield, the tendency toward chainless bicycles is strong here, and dealers report a large inquiry for information concerning this class of machines. A leading Hartford dealer, in conversation with a Cycle Age representative last week, estimated that the sales of chainless bicycles in his city next season would not be less than 25 per cent of the total sales.

Another Hartford agent, who has recently returned from a business trip to the principal places in the state, is confident that next season will be a good one throughout Connecticut for the retail trade. Business, he says, is better in the cities than it was a year ago, and in addition there is more money in circulation in the small towns.

Springfield dealers are congratulating themselves that there will be a considerable diminution in the number of agencies in this city next season. The popularity of the sport in Springfield resulted in the opening of a much larger number of agencies than the city could support, and some of the agents have opened repair shops and given up the sale of bicycles, while others have abandoned the field. A number of branch houses have been closed, only two remaining. Branch houses, with a few rare exceptions, have never paid in the Connecticut valley.

### OUR CYCLE TRADE IN ITALY SALE METHODS UNSATISFACTORY

Chicago Firm has Control of the Northern and Central Markets—The Tire Situation.

Milan, Italy, Dec. 2.—American manufacturers could do a nice business over here if they would deal more freely and with better knowledge of the circumstances. American machines are now very highly appreciated in this country, but some firms should be in better hands, that is to say, should have agents handling only their goods.

A well known Chicago firm has already got a firm hold on the northern and central Italian market, just because its Italian agent spends all his time in pushing the goods. Such is not the case with a large Connecticut firm, which turns out a better machine than the Chicago house, because its agents, besides pushing an English machine, are dealing in and manufacturing a thousand articles for industrial use.

#### Assembling in Italy is Urged.

Other American machines could become well known here if their makers would send over the parts separately and then have a small shop to assemble these components, and sell the machines directly to customers for cash. By this method a good deal of miscellaneous expense could be avoided and the duty would be lessened. Mounted wheels, or rims with tires on, pay like a full machine. This is already being done by an Austrian house which has a well equipped shop at Turin to put up complete cycles and make repairs of all kinds.

Nipples, spokes, washers, nuts, handles, saddles, bells, spanners, lamps, etc., unless of special pattern, can be bought here at very low prices.

#### Chance for Our Tire Makers.

There are in Italy two important tire firms. One firm, besides manufacturing their own tires of cheap quality and sold at very low figures, make tires with any trade mark. There is, therefore, keen competition between tires of the same quality made by the same firm, but sold under different names, each of them being advertised as the best. This firm, being the only house engaged in rubber manufacture in this country, has a certain advantage.

On the other hand, the goods of the foreign competing house are costly and not at all suitable for a poor country like Italy. Many cycle houses would have long ago turned their backs on this firm if they could have found a good tire at a reasonable price. Certainly this tire is well introduced and adopted by the best

cycle makers of Italy, as well as by agents of most foreign manufacturers, except, of course, those handling American machines.

If a single tube tire maker would take advantage of this state of things, and would open a depot at once and sell tires at a reasonable price, good business would ensue.

#### Poor Place for Tire Manufacture.

Any tire company starting business in this country should import their tires complete and avoid the big mistake of manufacturing, duty being less on complete tires than on parts thereof. Complete tires pay 50 lire per 100 kilos, while manufactured rubber pays 50 per cent ad valorem. Besides this, there is solution, benzine, thread, etc.

#### Object to Repairing Our Machines.

American bicycles should also be easily repaired. Brakes, cranks, etc., should be of the European pattern, so that a cyclist in Palermo should not be obliged to send a machine up to Milan or Turin to get it repaired because the broken piece is of too complicated a design and is not to be had anywhere else than from the general agent of the machine. Many instances are on record in which cyclists sold their American machines just because it was too troublesome and expensive for them to get them repaired, and other instances are known in which cyclists have found it best to change the rims and fit them with Italian or English tires because they could not easily replace a pair of American tires. The roads being generally very hilly and rough, tires should be very strong and the tread very thick.

Every machine here must be fitted with a lamp bracket, because, according to a new police regulation, cyclists are fined if they have no bracket and no light at night.

### NO INTERNATIONAL BANKS

#### Bill for Their Establishment in Latin-American Countries Defeated in Congress.

Bicycle houses which have export relations with Latin-American countries will regret to learn that the bill providing for the establishment of the International American Bank failed to pass the national House. The measure was skillfully handled, but a feeling appeared to develop that the bank might prove a dangerous competitor of the existing national banks because of the power conferred to establish branches. Representatives criticised this provision and offered amendments abolishing the branch privilege or extending it to all national banks. None of the amendments was adopted. Several of those who voted against the bill will not be members of the next House, where another effort is likely to be made to secure its passage.

It was not the original purpose of the bill to go beyond the Latin-American countries, and it was only an afterthought by which a provision was added that branches might be established in other foreign countries. The whole subject is likely to be taken up in the next Congress with a view to systematic legislation and may be referred to a special commission for consideration and report.

The opposition to this bank, the fear that it would become a monopoly and fix the rates of interest, is all due to the most ignorant and stupid misconception of what a bank is. It would be painful enough if this superstitious fear of a bank were merely encountered here and there, but to find it strongly entrenched in the House of Representatives of the most intelligent nation on earth is discouraging indeed.

## CUBAN TRADE POSSIBILITIES

### THE THREE DEALERS OF HAVANA

#### American Bicycles Not Represented—Live Manager Must Educate the Public—Time is Favorable.

Havana, Dec. 15.—After making inquiries and giving close attention to everything pertaining to the bicycle, covering a period of two weeks, the investigator is uncertain whether Cuba really has a bicycle trade or not.

A round up of all the bicycles in the hands of riders in this city, shows three of the Dayton pattern of 1897 (one held by the writer brought from the States, and two held by Cuban residents purchased in Jacksonville, Fla.), and two Columbias (owned by a gentleman and his wife from the States, on duty here with the Peace Commission). Besides the above, three other machines were noticed, but they were so ancient that it was impossible to tell when or where they were made.

Yet it cannot be said that Cuba has no bicycle trade inasmuch there are three bicycle stores, or rather three stores that handle bicycles, in the city. One of these is a sewing machine agency which carries a line of bicycles displayed in the usual fashion of the States at one side of the store; another is a notion house, which had but one juvenile on hand, but promised to have a new stock shortly; the third is a general variety store in which the cycles were relegated to the back part of the room, where they were accidentally discovered from a back street.

#### Nameplates to Order.

The sewing machine agent had sixteen bicycles on the floor nicely arranged. Business, he said, was very slow. There were no two name plates alike in the line, and some of the machines had no nameplate. "A nameplate goes with every wheel," said the dealer, "but we wait until the purchaser signifies what nameplate he wants on his wheel. We have a very fine workman who makes a specialty of that kind of work. Don't you think he does fine work?"

"But don't you like to show your customers who makes the machines?"

"Oh, that makes no difference, so long as we put a nameplate on for them."

The bicycles in his establishment were all English made, none of them weighing less than 35 to 40 pounds. The dealer was asked if he could ride a bicycle, and he answered that he had never learned, as he could not afford to ride one. The prevailing price for his machines was \$75 gold. He carried a small line of sundries and had very limited means for making repairs. One young Cuban complained bitterly because he was forced to pay \$2 in Spanish silver for the repair of a puncture, but he could not repair it himself.

#### Demand Must be Created.

The great trouble with the Spanish dealer—all the merchants in Havana are Spaniards—is that he will not move out of his way to make a sale. The goods are in his store, and if anybody wants them he has to find them.

Cuba is today just about where the United States was in 1892, shortly after the safety made its appearance. The Cubans and Spaniards are a pleasure loving people; they have good roads, and the streets of Havana are rideable, but the trouble is that they do not know the utility of the bicycle and the pleasure it gives; and they will never know if it is left for the Spanish merchant to enlighten them.

Havana is a city of 250,000 people. The means of transportation inside the city

are limited to the little cabs, with a fare of 20 cents per ride. There are great numbers of these cabs, and they all do a thriving business. There is also a steam dummy line and a horse car line, both of which run out into the suburbs, and are practically useless, as they do not touch the center of the town.

It would be useless for manufacturers to send their traveling men here to establish agencies; what is needed is for some manufacturer to start a branch, managed by a live bicycle man, who will go out among the people, teach them to ride, put a few advertisements in the papers, and generally stir things up.

#### Conditions Are Encouraging.

It may take a year or two to initiate the people into the charms of cycling, as it did in the States, but Cuba will have the advantage of present rock bottom prices. Another thing in the Cuban's favor is that there is hardly a day in the year when he cannot ride. There is wet weather, it is true, but the rains are not incessant; it may rain for a half hour and in another half hour the roads are dry. The weather is sometimes very warm in the sun, but there is never a time that there is not a fine breeze from the ocean, and it never seems as hot as the summer weather in the States.

It has been reported that two gentlemen from Jacksonville have been in Havana looking over the ground for the purpose of establishing an agency for a well known line of bicycles, but they could not be found. So far as could be learned there are no American machines here for sale.

### AMERICAN AND ENGLISH EXPORTS

#### Week's Shipments to North European Countries Are Large—English Returns for Ten Months.

Exports of bicycles and bicycle materials from the post of New York for the week ending December 13, are recorded as follows:

	Bicycles.	Materials.
Argentina . . . . .	\$ 8,190	\$ 1,792
Belgium . . . . .	70	1,875
British Guiana . . . . .	700	20
Australia . . . . .	115	115
Brit. West Indies . . . . .	78	78
Africa . . . . .	9,554	395
Brazil . . . . .	2,227	15
Brit. East Indies . . . . .	3,706	177
Germany . . . . .	33,961	10,699
Cuba . . . . .	276	....
Central America . . . . .	46	68
Denmark . . . . .	32,520	7,875
Sweden . . . . .	18,137	3,455
Dutch Guiana . . . . .	155	....
Ecuador . . . . .	120	....
Italy . . . . .	75	272
France . . . . .	300	....
England . . . . .	215	1,778
Switzerland . . . . .	373	....
Mexico . . . . .	300	100
New Zealand . . . . .	30	....
Russia . . . . .	100	2,839
Peru . . . . .	50	25
Uruguay . . . . .	....	192
U. S. of Colombia . . . . .	208	....
Austria . . . . .	50	....
Totals . . . . .	\$111,363	\$31,680

The total exports of bicycles and materials from the United Kingdom for the ten months ending with November, 1898, are compared with the complete returns for 1897 and 1896, as follows:

Month—	1896.	1897.	1898.
January . . . . .	\$624,435	\$763,820	\$480,465
February . . . . .	706,125	688,195	474,225
March . . . . .	891,875	855,830	482,245
April . . . . .	786,335	698,085	522,340
May . . . . .	793,765	697,940	434,700
June . . . . .	772,285	583,050	371,280
July . . . . .	716,755	566,850	383,475
August . . . . .	650,140	483,165	287,535
September . . . . .	683,560	430,460	316,870
October . . . . .	893,320	497,845	314,565
November . . . . .	720,600	446,410	....
December . . . . .	1,060,555	444,785	....
Totals . . . . .	\$9,278,020	\$7,155,645	\$4,067,700

Acetylene cycle lamps are rapidly becoming popular in Australia and large numbers of them have been recently received in Melbourne.

**MORE CYCLE SHOW OPINIONS****EXHIBITIONS HELP DEALERS****Manufacturers Still of Opinion That the Benefits of Shows Are Local in Character.**

No sane tradesman will believe that the manufactures are half so enthusiastic about cycle shows as their promoters or apologists. That the exhibitions in New York and Chicago will be trading places where agents can select their stocks to the best advantage is disproved by the fact that many makers will be conspicuous by their absence. Still enough support has been promised to make it certain that in each city tolerably good counterfeits of past shows will be presented.

Letters recently received on the subject of shows are herewith printed:

**Shows Are of Local Benefit.**

There is no doubt but what a cycle show in New York or Chicago would be beneficial to the trade of the dealers in those cities, but from our experience in the past we are led to believe that the benefit to be derived does not warrant the expense attending such an exhibition. It has been the custom in the past to dump into the markets of these cities the bicycles of defunct manufacturers, which naturally affects the sale of regularly made bicycles at prices that would pay a profit. Unless we change our views in the matter very materially we will not exhibit at either of the cycle shows referred to.

THE BARNES CYCLE COMPANY.

**Their Dealers Will Exhibit.**

We do not believe that a show is either necessary or desirable. Neither do we believe that it will repay the cost and effort necessary to make it a success. In a local show our dealers may see fit to take part, but we will not be directly represented in any of them.

NATIONAL CYCLE MFG. CO.

**Favors a Trade Convention.**

Cycle shows operated locally at reasonable expense to the exhibitor are undoubtedly valuable to the adjacent trade, and should be encouraged till such time as some radical change may ensue in the cycle trade generally. Such a show is for the public and in the interest of the retailer.

Regarding shows from the view point of manufacturers or national jobbers, the very success of the effort to interest the public is a bar to the proper issue and effect of the exhibition. Manufacturers have felt it incumbent on themselves to make display commensurate with their trade importance; hence they have been led into expense which might be compared with gunning for snipe with an eight bore.

The trade cycle show should be confined to the trade exclusively, and operated with the purpose of obtaining the greatest results with the smallest expense. The meeting should embody as a vital feature the getting together of all connected with the trade. Mutual acquaintance, information and negotiation should be the general features, while exhibition of samples would spread the goods before all interested. Agents and jobbers would naturally be present, and the public would be excluded. This exhibition could take place in any large hotel, the parties attending showing samples in their own rooms, which could be secured contiguous to one another.

W. W. STALL.

**Decision Under Universal Contract**

Buffalo, Dec. 19.—Supreme Court Justice Titus, sitting in equity term last Thursday, handed down a decision that will be of interest to dealers who sell bicycles on the installment plan and under the universal contract system. The decision was a reversal of a judgment given by the municipal court against a Mrs. O'Sullivan in a suit brought by Sweet & Johonnot, bicycle dealers, to recover a balance due on a bicycle. The woman bought a bicycle of this firm in May on the installment plan for \$60. She paid \$15 down and signed an agreement to pay the balance in monthly installments. She made no payments on the contract and when the firm undertook to collect from her she refused to pay on the ground that the weight of the machine had been misrepresented to her. The machine was taken from her and

suit brought to recover the balance due. The judge rendered a decision in favor of the plaintiffs for the full amount. The woman took the case to the Supreme Court, where the judge held that according to the contract upon which the bicycle was sold and which reads in part, "although the bicycle hereinbefore referred to shall have been retaken and any payment or payments that shall have been made thereon shall be deemed as the reasonable rental value of said bicycle," the firm has all that is due them under the contract, having retaken the goods.

**INTEREST IN LOCAL SHOW****Most of the Space at Philadelphia Already Taken—Department Stores and Holiday Trade.**

Philadelphia, Dec. 19.—Never before has so much interest been manifested in a local cycle show here as the tradesmen and bicycle public are now showing in the exhibition to be held in this city during the week of February 18 to 25. Former local shows, as a rule, have been held much too early and it is probably owing to the comparative lateness of the coming exhibition that the local dealers and out-of-town manufacturers are of the opinion that money invested in it will be well-spent as the local riding season usually opens the first Sunday in March. According to President "Pop" Brewster, of the local cycle board of trade, 75 per cent of the 200 spaces have already been engaged while the opening is two months away.

The insidious methods of department-store competition are well exemplified by the following remarks of the manager of the bicycle department of one of Philadelphia's largest general merchandise houses:

"I venture to say that we are doing more holiday business than many concerns handling only bicycles, and which are making a feature of the holiday trade. For instance, we have recently booked many orders for bicycles—intended for Christmas presents—from old customers having monthly, bi-monthly or tri-monthly accounts. No interest is charged by us, whereas if a customer of ours had gone to a bicycle store and bought a \$50 wheel, he would have been compelled to pay cash, or a bonus of \$5 if he asked for time. Many of our customers have tumbled to this fact, and have, besides, told their friends, who have opened accounts with us, for the sole reason, I truly believe, of getting a bicycle on time without being compelled to pay a bonus. The majority of these people could just as readily pay cash, but for some reason they prefer to take their time and save their \$5 besides. We profit in the long run, however, by reason of the other goods we sell these time buyers."

**Hampshire Cycle Co. Retires.**

Northampton, Mass., Dec. 19.—The Hampshire Cycle Company of this city will close out its business. The action was not compulsory, but was taken in the belief that the manufacture of bicycles will not be profitable in the future, except to companies which have large capital. The company was organized in 1895 and its output has borne a good reputation. The company has been well managed and its retirement will throw a considerable number of men out of employment. The stock of the company was held principally by residents of Northampton.

A company with a capital of \$40,000 has been started at Milan for establishing a public service of motor cabs.

**HUMBER TROUBLES BLOW OVER****INVESTIGATION IS ABANDONED****Martin Rucker Gives Security for His Heavy Overdraft—Small Sum Carried Forward.**

The poll of the shareholders taken at the meeting of the Humber Cycle company held in London on December 3 for that purpose, resulted in the defeat of the motion adopted at the meeting of directors held on December 8 to appoint a committee of investigation to inquire into the company's affairs, and into the acts of Managing Director Rucker. The majority of shares voted in opposition to the motion was 42,536. The annual report, which showed a general decline in business of the company, was adopted.

**Serious Reduction in Profits.**

The report of the directors of the company states that they very much regret the serious reduction in the profits, which is owing to the falling off in sales. In order to meet this condition of affairs, various economies have been effected in the working expenses, and the directors intend to still further pursue this policy during the current year.

The accounts show that the trading profits, after discharging working and management expenses and making provision for bad and doubtful debts, and with balance brought forward from last year, make a total of \$127,305. From this has to be deducted directors' remuneration, law costs, etc. This leaves a balance of \$100,715. To this sum the directors have transferred \$10,000 from the reserve fund for equalization of dividends, making the disposable balance \$110,715.

**Small Sum Carried Forward.**

The balance is recommended by the directors to be appropriated in the payment of interim dividends on preference and ordinary shares for six months, announced in June last, and a further dividend on the preference shares, making 6 per cent for the year, leaving a beggarly \$4,465 to be carried forward. No depreciation has been allowed on the machinery, etc., owing to the exceptionally bad year.

**Security for Rucker's Overdraft.**

With reference to the paragraph of the auditors' certificate (in which the auditors point out that the managing director's commission account was overdrawn to the extent of \$12,895), the directors explain that the remuneration of the managing director is dependent largely upon the result of the trading. It has, consequently, been the custom for him to draw, from time to time, sums on account of commission on profits, which he continued to do, although on a reduced scale, during the past year. Owing, however, to the unexpectedly large decrease in the profits, it was found, upon arriving at the result of the year's working, that his commission account was overdrawn by the amount named. The directors are pleased to state that security has been given for this amount.

**To Make Motor Vehicles.**

As foreshadowed last year, certain expenditure—about \$14,000—has been incurred in connection with motor work, which has resulted in the directors being able to place Humber motors on the market, and it is expected that a considerable trade may be done in connection therewith in the future.

A large number of new agents have been secured, and they have confidence in the current year's accounts showing much more favorable results.

## AND TRADE REVIEW

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries, \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

Copyrighted, 1898. All rights reserved.

### PROSPECTS FOR THE COMING YEAR

Everybody in the trade looks for a large volume of business in the coming year. Their hopes are solidly founded, for all the elements which conspire to bring about a season of prosperity are at hand. The buying capacity of the people is at the high point; there is an abundance of money in the country; industries which have languished for a long time are showing astonishing signs of activity; and, what is of more importance than all else, the belief is current that these happy conditions are not transitory or illusive, but destined to last for a long period.

It is this large faith in the future which sustains makers and agents and causes them to be cheery in advance of a season that, with less propitious omens, would produce alarm. Prices are low, but they have not yet reached that degree in descent where the industry is threatened with the extinction of all but the rich. There is still a safe margin in the manufacture of bicycles if rash speculation is closely guarded and sober judgment is exercised in marketing methods. On the other hand, there are certain forms of manufacture which by the friction of competition have become so worn that the profits are microscopic. The whole trade is aware of the difficulties which beset pedal, hub, and small parts makers, particularly when they seek the custom of people producing cheap bicycles. On the whole, however, the manufacturing end of the business is in sound condition. Goods are sold earlier, more safely and in undiminished quantity in the home market, while abroad they are in strong and increasing demand.

The agents, who are in sympathetic mood with the makers at all times, have a surprising confidence in their ability to make headway next season. So far from being discouraged at the low prices which rule, they cherish the hope that the lowered lists will provoke an unusually heavy demand. They are certain of selling to better advantage, both in the matters of time and profit on investment. In buying stocks they have gained some valuable experience during the past few years. As business risks for the makers to carry they are vastly improved, needing less and less help in the way of extension of paper each year. Formerly they had little else than enthusiasm to offer as security for a bill of goods consigned; now they have ratings in the books of the commercial agencies and are anchored quite as securely as the houses from which they buy. They are alert, cautious, modern.

### TRADE PAPERS AND CYCLE SHOWS

What the Cycling Gazette—the scavenger among trade journals—says about the editors of this paper is delivered at a safe distance. Let it go. Readers of the Cycle Age are not looking for that class of reading, or replies to it.

On the subject of national cycle shows the Gazette says: "The satisfactory demand for space and the widespread interest the shows are creating prove conclusively that the trade is willing and the public anxious that we return again to the custom of placing the very newest models on exhibition for a week in the two greatest cities of the country." The Cycle Age does not deal in flimsy, irresponsible assertions of that kind, but has printed

impartially what many manufacturers have had to say on the subject, and the whole trade knows whether they are for or against shows. The majority are against them."

The Gazette further says:

And another thing that strikes us forcibly is that if \$70,000 is to be made out of a cycle show at which space is sold at reasonable rates and exhibitors are well taken care of and protected against the ravages of outfitting concerns, wouldn't it have been a reasonable and proper movement for the Age's editor, while he was the Board of Trade's secretary, to have taken up the show project and organized exhibitions in New York and Chicago, thus at once benefiting the Board, while some reason for its existence still remained, and keeping out of the field such speculative gentlemen as Mr. Sanger, et al., who are willing to supply a want and pocket the earnings or pay the losses, as the case may be?

This shows very plainly that the Gazette looks upon the Board of Trade as an organization which was called into existence to make money for itself without regard for the permanent interests of the trade. The Board held the more responsible view that however possible it might be for its directors to prey upon the weakness of the trade by again resorting to cycle shows and playing the part of the trade sharks who snatch a bite here and there by working upon the mutual misgivings of competitors for trade, it was not in conformity with its purpose to rob its members for the idle satisfaction of filling the Board's exchequer. The directors were not embezzlers of the trade's money. Neither did they want to take two dollars from one pocket in order to enrich the other pocket with one. They were neither lunatics nor embezzlers, as the Gazette would have them be.

"The promotion of cycle shows is a legitimate business; may success attend the efforts of the managers," adds the Gazette in conclusion. The promoter's "legitimate business" is to make money out of the cycle trade, not for it. The cycle trade's business is to make money for itself. The majority of the trade have declared that the two things cannot be combined. That arraigns the show promoter against the trade. The Gazette sides with the promoter by its own confession. The Cycle Age is with the majority of the trade.

Local shows, on the other hand, are generally regarded with favor. Their value has not yet been thoroughly tested.

If the promoter of national shows can make his individual enterprise a success, he should do so. That is his business. But the trade has no reason whatever for helping him along against its own interests. A cycle trade paper has no business to help the promoter against the trade.

### SETTING THE PRESS ARIGHT

The daily press must be counted among the factors which have an effect upon cycle trade. At one time its services were of great benefit. The attention which was given to the cycle in the daily newspapers removed prejudice and created sales. But the daily press blows hot or cold according to the interest that the reading public is supposed to take in a subject. When the price question in regard to bicycles began to overshadow the more general questions of speed and utility and construction, the daily press made it part of its work to run prices down to an unprofitable level.

When the novelty of bicycle performance commenced to wear off, the daily press echoed the voices which cried the decay of the bicycle industry. The war diverted the public to subjects of more momentous importance. It became very clear that the bicycle was not first among subjects for talk. It is still of interest, but nearly everything that can be said about it has been said. On account of their mutual competition the newspapers cannot drop it from their columns, but they are in trouble to invent something to write about it. As a sporting instrument it does not lend itself to variegated writing like base ball, golf or other games. The sameness of the pedal-sport offers no inducements to the word-slinger; no large class of readers can derive special gratification from being able to understand and explain cycle phraseology, because there is none, except what is borrowed from the horse races. Cycling is too common to have a language of its own. Thus the very popularity of cycling operates against it so far as publicity is concerned.

Chainless machines presented a variation of the theme for a while, but have already entered among the acknowledged and therefore hackneyed facts which make tiresome reading. Mecha-

ical pacemaking machines have given a little zest to the appetite of the cycle column readers. But altogether there is a danger of tedium in those columns, and tedium is a mortal sin in newspaper work. It is to avoid this threatening tedium that daily newspapers are now catching at every straw that will allow them to say something about bicycles without causing their readers to fall asleep. In their difficulty they have found no line of thought so well adapted for this purpose as "the decadence of the bicycle."

This tendency of the daily press it is which must be reckoned with as a factor in the cycle trade. The bicycle trade requires no irrelevant publicity, no more than refiners of sugar or makers of shoes. Bicycles are henceforth a staple article like watches or sewing machines. To make bicycles a fad again and to boom their sale beyond certain reasonable limits would be a hopeless task. The marvel and the romance are no more shedding luster over bicycle enamel. Steel tube lightness and ball-bearings are work-a-day realities. There is more live interest in tires than in any other part of bicycle equipment, simply because tires are still considered imperfect.

In the long run the daily press cannot injure the bicycle industry by proclaiming the decadence of the bicycle, but temporarily it can cause a set-back if it continues to distort the healthy transition which is taking place into a sign of decay. It is in reality a sign of strength, but the public at large cannot be supposed to interpret the sign with better understanding than does the press itself, and thousands of sales may be lost in 1899 if little stupid reading notices as well as lengthy and grave articles are permitted to appear in print promiscuously bearing the message that cycling has seen its best days.

More sewing machines are sold and used today than when their mechanism and performance were the subject of wonderment and comment. More watches are used than in the "halcyon" days when the first steps were taken to manufacture them cheaply by automatic machinery and when half of the population were adepts on watch "movements." Hundreds of other articles, the products of modern ingenuity and skill, have been nine-days wonders and have afterwards settled down to an ever-broadening usefulness. And the press has had nothing to say to discourage people from purchasing them. That it has chosen to act differently in the case of bicycles seems to be properly a condition of affairs to which the attention of managing editors might be properly drawn by the trade. If each manufacturer and dealer will explain to the press in his locality the harm that is needlessly and unintelligently done to the trade by the reprinting or rewriting of articles in which cycling is represented as on the wane, a large share of trade which might otherwise be lost for the season of 1899, may probably be saved.

\* \* \* \* \*

At the end of the fiscal year, June 30, 1898, the exports of bicycles and bicycle parts were shown by the government statistics to fall only slightly short in money value of those for the fiscal year of '96-'97, although a very considerable price reduction had notoriously taken place. The same encouraging condition is noticed now by comparing the exports for the ten months ending October 31, 1898, with those for the corresponding period of 1897. The figures are respectively \$5,958,213 and \$6,139,844, and when the reports for the entire calendar year shall be accessible, it seems almost certain that the total for this year will be found to come within \$300,000 of the 1897 mark, or in the neighborhood of seven million dollars. In other words, despite the steady export of American bicycle-making machinery and price reductions by foreign manufacturers, the American bicycle has continued to make friends abroad. The number of them which has been sold in 1898 must exceed that sold in 1897 more than fifty percent, and when the healthy and cautious business methods are considered which have been followed by our manufacturers in the home market, it is almost a certainty that practically all the sales made abroad have been made at a good profit.

\* \* \* \* \*

Just to emphasize the reigning conditions in parts of the country which in other years have been regarded as rather barren soil for bicycle cultivation, let it be known the southern

banks, which usually have been large borrowers from New York at this season, have found it necessary to notify depositors that they are so crowded with funds that interest cannot be paid on balances. In the west similar conditions have prevailed for months past. Two leading western states have announced that school funds, hitherto much in request by borrowers, must now be kept unused, because the legal rate of interest required by statute cannot be obtained. The western borrower can now easily procure all the capital he needs at 3½ to 4 per cent. Indeed, so changed are the times that those who were formerly among the heaviest western borrowers are now become lenders. Thus, in the state of Kansas, where up to within twelve to eighteen months the banks were strained to the utmost to do their local business, these same institutions are now so abnormally crowded with deposits that they are totally unable to use their funds locally and are eager buyers of commercial paper in the open market. Such is the wonder wrought by rich crops and good prices for agricultural products.

\* \* \* \* \*

Representative manufacturers are noting that the wholesale business is opening earlier than in any previous season. Shipments of samples and stock to agents have in some cases been actually made, and it seems that manufacturers in the light of previous experience consider this brisk determination of the agents an unfailing sign of a large volume of business in 1899. The general prosperity of the country undoubtedly has something to do with the fact noted. Coupled with the low prices it brightens the dealer's prospect for holiday trade. Hereto comes that it has been accepted as certain that no construction changes of great importance will appear in 1899 patterns, so that early ordering is not attended with risk of missing a sensational improvement, and, furthermore, the relations between agents and those manufacturers who have treated their agents in a business-like manner during this and previous years have been cemented to a degree that induces stock orders where trial orders and negotiations were formerly the rule.

\* \* \* \* \*

That a certain article has never been sold in a town, and seldom if ever called for, does not necessarily argue its lack of value as a sideline. An occasional sale of such article does not interfere with other stocks and helps to swell the sum total of profits. The solicitations of traveling salesmen should not be allowed to determine of what a dealer's sidelines shall consist, local conditions and opportunities being weighed in the balance with good judgment. Neither is a visible demand essential to the adoption of novelties in sidelines. Oftentimes a sufficient demand to make a particular venture a success on a modest scale may be created by judicious reference thereto, without additional expense, in the regular advertising space, supplemented by good store display and personal efforts.

\* \* \* \* \*

When the government of a nation signals its people to expect the dawn of a new era of prosperity is the time to prepare for participation in its bounties. The authorities say that the general exports from the United States in 1898 will exceed those of any earlier year. Only twice have the exports in a year passed the billion-dollar mark; in 1898 they will be a billion and a quarter. The imports for the year will be less than in many years. The result will be the largest favoring balance of trade in the history of the nation.

# THE KING IN YELLOW

The time and money expended by the dealer in popularizing the wheel he represents is capital invested.

That capital will return dividends according as the bicycle he handles shall establish its value before the people.

The bicycle is a machine that deals with complex problems of mechanics and motion. Its builders must possess a deep acquaintance with the possibilities and limitations of the art—and, knowing them, must apply them rightly.

The makers of Stearns Bicycles have studied the needs of the business—their every improvement is toward the simplifying and perfecting of the bicycles they build.

The dealer who desires to maintain a successful business will build the structure of that business upon a good and permanent foundation.

The agents for Stearns Bicycles have found in the wheel they handle the full pledge of its value.

# MILWAUKEE TIRES

PUNCTURE PROOF

**Pneumatic  
Single Tube**

**Resilient  
Easy Riding**

F. B. Marshall, Architect, Milwaukee, Wis.  
MILWAUKEE, Wis., Dec. 1, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.  
Gentlemen: Replying to your inquiry as to my experience with your puncture-proof tire, I desire to state, that it has exceeded my expectations, and has proven eminently satisfactory in every respect. This is the first season I have ever finished without a puncture. Yours truly,  
(Signed) F. B. MARSHALL.

HOMESTEAD, PA., Dec. 13, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.  
Gentlemen: I received your letter a short time ago requesting me to give you my experience with your tire the past season but neglected to do so until today. I am not in a position to give the mileage covered while riding your tires, but wish to state that your tire has given the best of satisfaction and I appreciate its fine qualities and can recommend it to any one. I have ridden your tire from the time of purchase up to December and have ridden it through the yards of the Homestead Steel Works over cinders and scrap steel and other things of that nature found about a steel works and liable to puncture a tire. I have not had a single puncture during the season and there is no rider who has used a wheel about the premises without receiving one or more punctures every week. I consider it the best tire made. I have had experience with a great many tires, and find your tire to be the only tire that would do the work.

Of course, it is very hard to convince people of the facts. I remain, Truly yours,  
(Signed) WM. GLUCK.

DOUD SONS & CO.,  
Manufacturers of Flour Barrels and Stock.

WINONA, MINN., Nov. 25, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.  
Gentlemen: Replying to your favor of 19th inst. as to how I like your tires, I am pleased to say that I like them very much. I have ridden a pair of them on my wheel for the past four or five months constantly, and have never had a sign of a puncture, which is a great pleasure in riding, and I have no hesitation in recommending them. Yours very truly,  
(Signed) R. T. DOUD.

PETTIS DRY GOODS CO.  
INDIANAPOLIS, IND., Dec. 10, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.

Gentlemen: In giving you a statement of my experience with your Milwaukee Patent Puncture-Proof Tires, I will state that they are the best tires out. Judging from my experience with your tire I do not believe that it could be punctured by ordinary usage. I ride on an average of 15 to 20 miles every day. They seem to run easier than other tires and are not so easy to slip on asphalt pavements. It is a reliable tire and worthy of great success. Yours truly,  
(Signed) GUY SHUMM, Ass't Advertising Manager.

Representatives Wanted. Write for Prices and Other Information.

## EXORBITANT EXPRESS RATES

### Tradesmen of All Kinds to Combine and Lower Charges by Using Fast Freight

Retailers of bicycles, more than any other class of tradesmen, will welcome the news that at length a determined effort is being made to compel the express companies to moderate their extortionate charges for carrying goods. The bicycle makers, too, will wish the enterprise the fullest measure of success, for though they are often indifferent to the results of the harsh practices of the carriers, since they seldom pay the bills for transportation, yet their interests are so inseparably bound up with those of the agents that whatever threatens or improves the fortunes of the retailers exercises a corresponding influence upon their own affairs.

#### Volume of Express Business Increasing.

The campaign against the express companies will be conducted by the Merchants Association of New York, which is seeking an equitable adjustment of rates, in view of the increasing volume of merchandise sent by express. Emphasis is laid on the fact that by reason of radical changes in modern methods of doing business express service has become indispensable to merchants, who have been compelled to ship hundreds of packages by express which formerly went by freight. At the same time the price of merchandise thus shipped has steadily fallen, while in general express rates have not decreased. It is further stated that today merchants of nearly all classes are compelled to pay from 5 to 15 per cent of the value of goods for express charges, where formerly only a fraction of 1 per cent was paid. Express charges, it is asserted, are from three to more than 200 times as much as corresponding freight charges.

#### Fast Freight to Supersede Express.

It is the purpose, therefore, of the association to bend the energies of the entire mercantile class of the United States to substituting for the express companies an efficiently organized fast freight service, which can perform practically the same function as the present express companies at far less cost and with much greater benefit to the railroad companies by whom the service is performed, and, for small package service, to bring about the substitution of the United States postal department in place of the express companies.

#### Elastic Scale of Charges.

The association proposes to show that the express companies sometimes value the terminal service as low as four cents for individual shipments and sometimes as high as several dollars for precisely the same work. While they have a public schedule of rates, they charge what they can get, and under the stress of competition will do for 8 cents or 10 cents what they would otherwise charge from 25 to 50 cents for. It is desirable that the express companies should show to the legislatures of the several states what the conditions are that warrant an elastic scale of charges, varying several thousand per cent for precisely similar service.

#### The "Terminal Charge" Racket.

To let light into the "terminal charge" stronghold of the express companies the association can produce the records of more than 20,000 individual shipments, if necessary, which will show that the market value of the terminal services per-

formed by the express companies, as shown by the rates of competing local express companies, is only about one-half of what the express companies charge. The express companies, themselves, under those conditions of competition, cut their rates one-half; but when competition does not exist their charges increase in proportion to the weight of the package to the extent of several thousand per cent for a service whose cost is not increased in the slightest degree. To illustrate this the railroad companies receive \$1.44 for carrying about 100 pounds 900 miles. The terminal charges of the express companies upon the same package are \$2.17. It requires a high degree of assurance to attempt to justify this terminal charge as equitable.

The express companies increase their terminal charges in proportion to the distance traveled by the package. Can the ingenuity of man demonstrate that the cost of that terminal service is increased because the railroad transports that package one thousand or ten thousand miles?

#### Methods to be Pursued.

The purpose of the Merchants' Association is to require the express companies to justify practices of this sort. To do this it will shortly have organized, in every election district in each of the states where it proposes immediate action, a committee of the most reputable and influential constituents of the respective assemblymen, every one of whom will be a sufferer from the exactions of the express companies.

It is the purpose to point out these abuses to the legislatures, which are able to apply the cure, and to organize the business interests of this country, in every state if necessary, so that the legislatures shall not longer overlook the evil effects of permitting such abuses to continue undisturbed their pleasant and profitable occupation of "standing up" the public on the one side and diverting the just earnings of railroad properties on the other.

#### Railroads Have a Hard Time.

The association believes that, as a whole, the railroads of this country are not overpaid for the services they render to the public, and that they are fairly and justly entitled to a remunerative rate upon the greater portion of their traffic; and that if such remunerative rate were established under such conditions as to be uniform and certain it would be one of the greatest benefits that could be conferred upon the people as a whole. For there is no greater fallacy than to believe that very low rates of transportation, in themselves and without reference to whether they are performed at a profit, are desirable. It can easily be shown that so far from being desirable they are a curse.

#### How the Trouble Was Precipitated.

The exactions of the express companies have been imposed in such petty amounts that individuals could not afford, however they might resent the imposition, to resist it; but the last straw was piled upon the patient camel's back when they undertook to impose upon shippers already burdened almost beyond endurance the payment of the stamp tax required by act of congress upon express shipments. A similar duty was imposed

upon the non-prosperous railroad companies, already staggering under deficits and insufficient earnings, paying little or nothing to their stockholders, and supplying to the public a service of great efficiency at rates so small as to be astonishing. The railroad companies did not attempt to avoid their just share of the public burden, but the express companies did attempt to evade and are still evading it, and they were able so to do simply and solely because by the oversight of legislatures which have set down their foot upon extortionate and prohibitory charges for transportation service by public carriers, the express companies have hitherto been independent of all legal restriction.

#### Some Curious Revelations.

In conducting this controversy the Merchants' Association is circulating widely a statement of the reasons for legal regulation of express companies under the title, "The People Against Transportation Abuses." A point is made on the authority of the last census that while the various companies were capitalized at \$55,000,000 in 1890, their actual investment was less than 10 per cent of that amount. They place the capital of the Adams Express company at \$12,000,000, giving their investment as \$1,128,915, their 8 per cent dividend on capital stock thus virtually being 80 per cent on the investment, besides having accumulated a surplus of \$15,000,000, of which sum \$12,000,000 has recently been distributed to the stockholders. The American Express company is said to have an actual investment of \$1,276,619, on which they pay \$1,080,000 in dividends annually, in addition to accumulating a surplus. The nominal capital of the United States Express company is given as \$10,000,000, with an actual investment of \$700,000, while the figures of the Wells-Fargo company are given as capital \$6,250,000, on an investment of about \$725,000.

#### What the Railroads Receive.

It is further shown that the railroads get only 40 per cent of the express charge for rail transportation, while the companies get the remaining 60 per cent for terminal transportation, which after paying the cost of the service is said to yield an annual profit of 150 to 175 per cent on their actual investment. These are a few of the reasons given for requiring a more equitable adjustment of rates in the interest of the merchant and consumer, and it bids fair to be a bitter struggle between good fighters and powerful interests on both sides.

#### Parts Jobbers Abandon Their Scheme.

New York, Dec. 19.—The committee recently appointed by the local jobbers of parts and sundries to sound the trade on the question of forming an organization to promote harmonious relations between members and to establish a scale of prices for small and large quantities, reported last Tuesday that it was not feasible to form the contemplated association, and so the scheme has been formally dropped.

#### Bankrupted by Elbridge Company.

A petition in bankruptcy was filed December 15 by Reuben B. Sweet of Elbridge, N. Y., who was formerly connected with the Elbridge Cycle company, which suffered financial embarrassment. He made himself personally liable for the debts of the company and has already paid a number of obligations so contracted. He seeks to be discharged in the United States Court from the judgments now standing against him.

A promoter is asking Conneaut, O., people to take \$20,000 of stock in a proposed bicycle manufactory at that place.

## COMMERCE IN FOREIGN MARKETS

### IMPORT DISTRIBUTING POINT

Hong Kong is gradually becoming an important distributing point for American cycle exports. Within the last three months, the agent of an American house obtained an order for 1,200 sewing machines from an English firm and at the same time an order for a considerable number of bicycles. A careful survey of the economic conditions of Hong Kong reveals two facts: First, a general, permanent increase of trade; second, unusual activity in mercantile circles, owing to the great demands made on the local market by the large American squadron and army on this coast.

Our forces of occupation have done more than conquer a country; they have made an impression on Asiatic markets that can never be effaced. When our fleet first arrived there were a few sample cases of American tinned milk, fruits, meats, whisky, beer, etc., in the big English and German wholesale houses. The imports from America were made up almost wholly of California flour and American kerosene. Today every steamer and ship from America brings cargoes of American goods. While their ultimate destination is Manila, they are handled by European firms and come before the public in such imposing quantities that first curiosity is aroused, and demand follows.

Our merchants never seem to realize that Hong Kong (the feeder of southern China) is an absolutely free port, and that goods manufactured in the United States come from a country in which a tariff prevails. If the American manufacturer wishes to compete in these markets, he must deduct from the price of his goods the extra amount he usually adds on account of this protective tariff.

### LECTURING THE ENGLISH TRADE

Now and again a trade journal is found in England with sufficient courage to proclaim the true state of the cycle industry over there. It was recently written that there are some in this English trade who assert that the demand for bicycles is on the decrease, and that British manufacturers are being beaten by foreign competitors. Others, more optimistic, aver that the trade has reached a certain point at which it will stand for a time, and then either decrease or increase in importance according to the abilities or enterprise of those who control the industry. Certainly, no one can look upon the almost wholesale reduction in the prices of bicycles which has taken place during the past few months without some feelings of alarm.

One is inclined to think that the leaders of the cycle trade at length realize that the days of big profits and fat dividends are gone by, and, noting the keen competition which is springing up all around, are prepared to face it and fight it, and sell good goods at prices yielding a profit sufficient to pay an honest dividend on fair capital and without so much of the swagger and boom which unfortunately has been part and parcel of a good percentage of the cycle trade in the past. This means settling down. There will be less braggadocio in the future than there has been in the past. There will not be so much buying of shooting boxes or trips to various resorts on the Continent, not so much hobnobbing and scraping to the patricians, but there will be a more earnest endeavor to work.

English manufacturers are awaking to the fact that too long have they neglected foreign buyers. Content with a big profit from local and comparatively safe purchasers, they have been prone to give the foreigner the go-by, since he is a long way off, and his check may be uncertain. They have neglected to send out competent travelers abroad, and have in ninety-nine cases out of a hundred only dealt with the foreign agent, who comes, almost on his hands and knees, to annual exhibitions, and has been invariably snubbed. Trade of America is completely lost; at the present time it is almost lost in France, Germany, Italy, Spain, Russia, and other countries of Europe. With the colonies a fair but a diminishing trade is being done and at last, now that the manufacturers find it is necessary to compete with foreign makers, they find also they must give a larger output, which cannot be consumed alone by England, but which must be distributed over the world.

The trade has arrived at a point of its career which means its making or marring.

### DISPLAYS FOR CAPE TOWN INVITED

The Colonial-American Importing company of Cape Town, South Africa, writes under date of November 8, that it believes it is in a better position to look after the interests of the American bicycle manufacturers than any other party there. The company has men on the road looking after the trade of the American manufacturers and will soon open a permanent exhibition of American products and manufactured goods in Cape Town. This exhibition is to be centrally located and to be made attractive for visitors so that it will be an advertisement to all who exhibit. Manufacturers will be charged only the actual rent of the building divided according to the space each one's display takes up. For the work of introducing the goods a commission of 5 per cent for all goods sold will be charged. The Canadian manufacturers already have such an exhibition there and are doing very well. They are taking a lot of trade that was once done in the States. This Canadian exhibition is showing some very fine machines. The Colonial-American company is doing all it can to hold the trade, but it must have the support of the manufacturers of the United States if the position of the United States bicycles is to be maintained. The makers are therefore invited to send samples for exhibition purposes, and the company promises to give them every attention and to push sales.

### GERMAN DUTY WILL NOT BE INCREASED

There is now little fear that the German government will increase the duty on American bicycles. It has once practically discountenanced the project. The subject has been taken up and discussed by the chambers of commerce at Bielefeld and Chemnitz, and other important commercial centers, and condemned. At a meeting of manufacturers during the recent show at Leipsic, a motion favoring the change was suggested, but so overwhelming was the opinion that there was no chance of success, that the motion was withdrawn. The German dealers and manufacturers who attended the Stanley and national shows in England were unanimously of opinion that the movement is dead. The trade has heard a great

deal more than it should about a project which had no chance of success from the start, merely because the German manufacturers kept up a continual agitation in the press.

### SPACE AT THE PARIS EXPOSITION

The area allotted by the French government to the American exhibitors at the Paris exposition of 1900 has been increased over 40 per cent. This concession was only made after the French officials had been informed by our representatives that the value of the manufactures of the United States amounted to 35 per cent, or over one-third, of the total value of the manufactured products of the world; that our agricultural resources represent nearly 40 per cent of those of all countries combined; that in railroad transportation the mileage of the United States exceeded that of the whole of Europe; that our mines produce more than those of any nation on earth, and equaling those of all Europe; and that there is a steady export trade of pig iron to Germany and England; that the wealth of the United States amounts nearly to 400,000,000,000 francs, or twice that of France, equal to that of Russia, Austria, Italy and Spain combined, and 25 per cent more than that of Great Britain. These and many other facts, indicating the importance of our nation and the basis of our demands at the exposition, were laid before them. The French press published the startling figures presented, and they were known throughout Europe. Within 48 hours the French government officially requested the exposition authorities to concede to the United States the demands we had made. It was the greatness of our country that secured the results achieved.

The phenomenal growth in our foreign trade since 1893 must be attributed to some extent to the stimulating influence of the World's Fair, which so conspicuously introduced and advertised the merits of American manufacturers and other products to the world. There was a factor at work to produce this remarkable growth in our foreign trade, which is the greatest factor in all branches of trade. This factor is advertising, and, in this instance, advertising in the most advantageous and influential manner—viz., by exhibiting our manufactures and products beside those of other nations. A strong stimulus and growth have also been imparted to our home trade in every department by the exposition of 1893.

If the Columbian exposition of 1893 has assisted in producing such results, the Paris exposition of 1900 will produce far greater results, chiefly in our foreign trade. That exposition will offer to exhibitors of the United States an opportunity to present their exhibits to many times the number of foreign purchasers who visited the Chicago exposition. The number of foreigners who attended our exposition of 1893 did not probably exceed 100,000. The number of individuals not American who will attend the Paris exposition will probably be 4,000,000. Consequently the opportunity for exhibitors of the United States to present their goods to foreign buyers at Paris in 1900 is safely 20 to 30 times greater than at Chicago in 1893. This argument should be a most pertinent inducement to all exhibitors of the United States to display their goods at the Paris exposition.

## RECENT PATENTS

### Soldered Mechanical Joint—Ball Bearing Roller Gear— Spring Cushioned Handle Bar—Automatic Pump

**German Mechanical Joint.**—It is common in brazeless or mechanical joints to use fastening means which put a severe expansional strain on the surrounding lug. In this joint, known in Germany as the "Naturverband," or "natural joint," no expansive strain is placed upon the lug beyond that which would have effect in an ordinary brazed joint. The interior of the lug is hollowed out after the lug has been bored. A tapering sleeve is driven down inside of the tube end and by compression in dies the tube and ferrule are partially collapsed so that when the tube is placed in the lug the hollow formed by the collapsing process and that made in the lug will match each other, forming an open space between the tube and lug wall, the large end of the space being toward the outer end of the lug. Small holes leading to this open space having been previously drilled in the lug, some form of easily fusible metal is poured in a molten state into the space, forming a tight joint. Soft solder is a suitable metal to use for the filling-in process. The collar which will lie around the tube in a finished joint making it im-

possible for the tube to be withdrawn under any circumstances there is but little tensional strain placed upon the soldering metal so that with its very slight tensional strength it is able to do all that is required of it. The joint as shown or in a similar form is used by several German bicycle manufacturers. In its original form an externally visible bead in the tubing indicated the place where the solder was poured in. The inventor is Reinhard Felsche, Magdeburg, Germany.

**Ball Bearing Roller Gear.**—The invention is a development of roller gears such as are used to take the place of bevel gears in propelling chainless bicycles and aims at the reduction of friction between the teeth of the driving gear and the pins on the pinion. The driving gear has the approximate form of an ordinary spur gear. The pinion which runs at or nearly at right angles to the gear, is fitted with radial studs on its periphery. Over each stud is set a cup having a circular groove around its outer edge to form a ball race. A similar cup, but inverted in its relation to the stud, is placed on the stud above the first cup, a row of balls having been placed between the two. The outer face of the second cup is countersunk, allowing the screw which binds the cups to the stud to come flush at the head end. The two cups when in place form a ball race, which keeps the balls from falling out yet al-

lows the balls to project enough to form the contact surface with the driving gear teeth. The balls when the gear is in operation will roll in two directions; that

is, they will roll circumferentially around their races to accommodate the motion of the teeth of the driving wheel and will roll laterally in their races to accommodate the motion of the pinion itself. This double motion of the balls in a race which embraces the balls for more than half of their diameter seems bound to cause the balls to slide as well as to roll; and sliding balls are no more anti-friction features than sliding teeth or pins. Wear on the cups may be taken care of by occasionally turning the cups in their relative positions to each other. The inventor is F. G. D. Holmes, Phillipsburg, N. J.

**Automatic Pump.**—It is common in the automatic inflator devices attached to the bicycle, which have had but partial success, to have one or more pump cells built into the inner tube of the tire either left unsupported or supported by a solid piece of rubber. In the first place the semi-inflation of the inner tube prevents the complete pressing together of the pump cell walls, while the pressure of air in the inner tube prevents the re-expansion of the cell and the perfect drawing in of fresh air. In the second case the action of the pump cell is hindered by the pressing in of its walls on increasing

pressure in the inner tube, and since the solid supporting piece displaces the center of gravity of the wheel from the axis successive jars are caused as long as the pump is in operation. The inflation of a flat tire by this process is slow and uncomfortable by reason of the small delivery of the pump and the violent shocks. In order to obviate these objections the inventor places the pump cell outside of the inner tube. The tube is contracted for a distance at any point, and its walls made heavier along this contracted portion so that it there possesses greater elasticity than at other points. In the free space between the contracted tube and the outer cover lies the pump cell which

has at one end an opening into the inner tube and the proper valve for the discharging of air. At the other end of the cell is an opening which is extended by means of a tube through the tire and rim of the wheel. The walls of the cell are secured to the inner surface of the outer cover and to the inner tube so that they are automatically extended after having been pressed together. The walls of the cell may, however, be made to have sufficient elasticity in themselves to make unnecessary their attachment to the tube and outer cover. Since the air which the cell contains is forced through the delivery valve into the inner tube when the pressure of the former is only a little higher than that of the air already in the tube, the pumping action of the cell is independent of the pressure which may exist at any time in the inner tube. The elasticity of the contracted portion of the inner tube will at all times offer a certain excess of resisting power, so that the resistance of the delivery valve will be overcome and the pump cell emptied as long as the tire is sufficiently pressed together for this purpose. All these devices are of doubtful value, as the inventors seem to be working on the wrong principle. Tires should be so easily repaired that automatic pumps would be unnecessary. The inventor is Joseph Kersting, of Berlin, Germany.

**Spring Handle Bar.**—On the upper end of the stem is arranged a head plate having upturned flanges on its ends. A similar plate, though free and inverted, with end flanges which fit inside the flanges of the head plate, is hinged to the latter by a transverse bolt running through the two. A clip which hooks under the front side of the upper plate passes over the central part of the handle bar tube and is retained by a screw passing through its

ear and screwing into the plate underneath. Around the center of the bar is a threaded annular groove the threads of which mesh with the threads of a screw laid in a groove in the top of the upper plate. This screw may be turned by a screw-driver to adjust the tilt of the bar. Running downward from the top of the upper plate is a bolt with a nut at its lower end and a surrounding spiral spring retained between the nut and the plate. The spring limits the swing of the upper plate and thus cushions the handle bar. The inventor is W. A. Marbach, Cleveland.

#### Another Firm of Assemblers.

The organization of a new assembling company in Peoria, Ills., is about completed. A half dozen workmen, formerly connected with the Ide company, along with several capitalists, were in conference recently and in a few days it is expected the new company will be formed. It is the intention to use the old watch factory building for the work. It is expected that the business will be in running order by the first of the year.

The first petroleum bicycle made its appearance in Vienna November 28.

## CONDITION OF MOTOCYCLE PROBLEM

### Summary of Progress Made Toward Producing a Mechanical Wagon of Unlimited Range

There is no doubt as to the demand for mechanical vehicles. The public is ready to buy, but where is the wagon to sell?

Some of the papers say that this public demand for automotors is due to the influence of the mechanical press, but if anyone will look back for fifty years he will find quite the same interest expressed in automobilism then as now, and the troubles with the early mechanical wagons were just the same as those existing today, and the real reason that the motorcycle has not "arrived," is simply because it doesn't exist, so far as a wagon of unlimited range is concerned.

#### Facing the Situation.

For limited ranges the electrics, although seriously handicapped by their weight, are usable machines. They are clean, silent, and powerful. They are compatible with that degree of elegance which the American demands. But 25 or 30 miles is their limit; after a run of that length the electric carriage demands a stop of not less than three hours, if the accumulators are to be efficiently recharged.

But the electric carriages are clean and do not leave a trail of offensive odors behind them, and although they are very expensive they make a fine appearance, and in certain fields they are wholly satisfactory. True, they would have a much larger use were they not so heavy and costly. But the electric carriages and the electric delivery wagons may be fairly said to be acceptable; if they were not acceptable buyers would not be paying from \$2,000 to \$3,000 apiece for them.

Here we stop. The electric wagons begin and end the list of clean, silent, and inoffensive mechanical vehicles.

I am perfectly well aware that it is regarded as treasonable for an ardent advocate of automobilism like myself to say that there is no such thing on the market as a clean, silent, and inoffensive motorcycle of unlimited range. Nevertheless I make that assertion here, and I am fully convinced of two things: First, that the American public will never accept the explosion engine driven wagons so long as they are dirty and deliver vile odors in abundance; second, that the correct thing to do is to face the situation, to fully recognize, both in the factory and in print, the faults which all who are informed in the matter well know are now present in all automotors of unlimited range, and so take the first step towards producing a really satisfactory road wagon to go any distance.

#### Electric Vehicles in Use.

We began here in the United States to work on motorcycles in the '90s. What have we done?

It was told me at Hartford the other day that the Pope company had sold about 35 electric carriages, mainly abroad. I did not understand that these carriages had all been delivered. Riker has furnished Altman of New York with six electric delivery wagons, has sold two to the Gorham company, and has partly filled orders for thirty or forty electrics in France and England. The Electric Vehicle company has thirty-five electric cabs and broughams in operation out of the hundred which were to have been running the first of last May, and which are slowly being finished. The Fisher Equipment company of Chicago is, as I am told, sup-

plying a considerable number of wagons to purchasers. Several physicians have bought electric carriages, and express great satisfaction in their use.

All of this shows well for the electrics, and this good showing is due simply and solely to the cleanliness and elegance of these wagons. In point of fact the electrics are far from ideal creations; they are too heavy for pneumatic tires, they cost too much, and they do not run far enough. But they are clean and still, and fine, and these virtues overbalance their faults, and they find purchasers.

When we come to American explosion engine driven wagons, there is very little evidence of their acceptance.

The Duryea brothers, Charles and Frank, have produced some fine gas engine driven wagons, fully equal to anything ever produced anywhere, and when driven with deodorized gasoline the Dur-

Duryea's Three-Wheeler on Muddy Road.

yea wagons give off very little offensive odor. I have never been able to obtain any exact information in regard to the sales of Duryea wagons, but I do not believe there have been more than twenty or so of them sold. If I am wrong, I shall be happy to correct the error. The Springfield Duryea company has spent about \$70,000, and neither of the Duryea brothers are now personally connected with the Springfield company. Charles Duryea is building 3-cylinder explosion engine tricycles at Peoria, Ill. The three cylinders give a much more nearly constant torque than two cylinders, and are far superior for hand driving to a single cylinder. The single cylinder Otto cycle gas engine depends so much on fly-wheel momentum that it makes a weak drive in mud or snow, as the fly-wheel velocity must be maintained and this is, of course, impossible when the wagon travels at a slow rate. With three cylinders the wagons are strong in mud or snow. Duryea's information to me is not quite explicit. It seems to be as follows:

"The picture herewith shows our 700-pound motor trap as it appeared on a

rainy day in October on Malvern street, Peoria, Ill. For a full week the sun had not been visible, and rain had fallen every day. This street is black loam, without gravel or other supporting material, and the wet weather preceding had rendered it very muddy. It was selected as being the muddiest street available, and was in worse condition than is commonly found, except in the spring of the year, when the frost is coming out. The depth of the mud is shown by the photograph, and the vehicle, after being photographed, started easily and freely, showing that much deeper mud could be traversed. It is on this point that most of the motor vehicles yet shown have failed. They have been so heavy they had not power sufficient to push themselves even through ordinary mud. Our experience during seven years of work in this line has shown us the necessity of building a vehicle that can traverse the average road and this necessitates passing through considerable mud. Being light, our trap does not sink deeper than horse vehicles, and the high power is ample to drive where horse vehicles go."

#### Deodorized Gasoline.

I believe Duryea's increase of the number of cylinders is right, and I also believe that six cylinders would give better results, cost less, weigh less, and be in

every way more satisfactory than three cylinders. But it certainly requires a very strongly driven wagon to travel such a road as is shown in the illustration.

Duryea writes that his Peoria wagons give out little or no smell, when properly managed, and I rode on a Duryea wagon, Frank Duryea's last Springfield model, early this year, which gave out no odors perceptible to the passengers. This wagon used deodorized gasoline, as previously mentioned. If the Duryea wagons can be regarded as inoffensive on the score of evil smells, then they come near to filling the requirements of the American public at large.

Winton, of Cleveland, has sold, as I am informed, somewhere about 25 wagons. These are good strong wagons, but not clean. The best evidence of the good qualities of the "Winton" are found in the fact that his sales have been made principally through the recommendations of users to prospective purchasers.

The Victor, Chicopee Falls, has three experimental wagons on the road, which I was not allowed to see, and in regard to which no information was given be-

yond the statement that the prospect was encouraging.

The Pope company, which does everything on a magnificent scale, must have spent well towards half a million of dollars in its search for the satisfactory mechanical wagon. I have no authoritative information, but I know what such things cost when handled on the Pope scale of operations, and I am confident that the motorcycle must have a debit on the Pope books of not very much less than \$500,000, all told. In return for this very great expenditure the Pope company has its electric carriage to show, and their explosion engine driven parcels carrier. They also have, not ready for description, a 2-passenger gas engine phaeton, and a novelty, which is really a revival of one of the earlier forms of the gas engine, which is now being licked into motorcycle shape. The Pope policy does not permit public notice until manufactures are ready for sale, hence it is impossible to speak except in the most general terms in regard to the Pope experimental work. It is of great interest, costs a great deal of money, and will undoubtedly result in final success. Up to the present time I am not informed that the Pope company has sold any explosion engine driven passenger wagons.

The Haynes & Apperson (Kokomo) factory has sold some vehicles, explosion engine driven; the number was not stated in reply to a request for exact information. The Boston Hayes & Apperson company is now engaged in completing its first wagon.

In regard to other gas engine driven wagons, I have no definite information.

#### Not Fundamental Novelty in Motors.

There are a considerable number of new gas engine driven wagons in course of construction, none of them, so far as I am informed, showing any fundamental novelty, all using the Otto cycle, and none of them being odorless.

From all of this, which is not very far from the actual condition of the explosion engine driven wagon in the United States, it appears that this vehicle, as offered up to date, does not meet the views of American purchasers.

#### Equal to Best Foreign Product.

This lack of American disposition to buy gas engine wagons is not due to inferiority of American wagons. The De Dion wagons, 4-wheels and tricycles, have met with no more favor than our own production. I endeavored to obtain some information as to sales from Mr. Skinner, who has been handling the De Dion in Boston, but he declined to make any definite statements. The De Dion machines are very strong and fast, but are not the shape to suit us. They carry the passengers too near the ground, and the 24-inch wheels do not meet our ideas, although they are probably right from an engineering standpoint. The De Dions are noisy, and do not carry the passengers in comfort and worst of all emit unendurably offensive odors.

Two attempts have been made in New Jersey to use a carbonic acid gas driven motor for road wagons. The carbonic acid gas motor is a very old invention, has frequently been exploited, and has never met with any real success. There is nothing in the past history of this motor to justify any hopes that its use will prove a success in road wagons.

Many people believe that compressed air can be successfully used in driving motorcycles, and such a wagon has been built by Hoadley, or Hoadley & Knight, at Worcester, Mass. This carriage is very large, seating six persons, and it is heavy, though not heavier than the electric carriages. I have been unable to obtain any detailed information in regard to this carriage, and do not believe that its builders regard it as an unqualified success. It

would be difficult to find a motor for a road wagon offering fewer obvious advantages than compressed air, because a supply of compressed air is obtainable at very few places. The use of compressed air in piston and cylinder engines involves some peculiar features, and these things, together with the difficulty of obtaining a fresh supply of compressed air when the tank becomes exhausted, make a hopeless case for the compressed air driven road wagon. The whole history of compressed air driven vehicles, which is more extensive than is generally known, is composed of a series of disastrous failures, up to the present time. Now Hoadley & Knight are engaged in applying compressed air to street railway car propulsion in New York—and the outcome remains to be seen.

#### The Diesel Motor.

The much mentioned Diesel motor, which gives power with less fuel expenditure than any other form of heat motor, does not show anything encouraging when considered as a motorcycle driver. The Diesel engine works on the Otto cycle, and is heavier and more expensive than a steam engine and boiler to furnish the same power; these points are against the Diesel motor for road wagon use, but the most serious objection to the Diesel motor seems to me to lie in the extremely heavy initial pressure on the piston at the beginning of the working stroke. This is no less than 500 lbs. to the square inch, and this great pressure, intermittently applied to the piston, causes a plainly felt shock at the beginning of each working stroke, which can hardly fail to produce an unpleasant effect in carriage driving. This high initial pressure is accompanied by a correspondingly high temperature, which is favorable to the perfect combustion of gasoline, which is the fuel employed, hence the Diesel motor exhaust is almost odorless. The Diesel motor depends wholly for efficiency on the maintenance of conditions, which steam engine builders go to great expense to avoid by compounding their engine cylinders. Under these conditions the Diesel motor does not seem at all likely to be used on road wagons, where all jar, shock, and vibration must be avoided.

The initial gas engine piston pressure is somewhere about 175 lbs. with the compression commonly given, and this is most economical of fuel. By giving less compression a smaller initial pressure results, and this gives a smoother working motor. Frank Duryea, in his last Springfield wagon, made the cylinder clearance equal to one-half the piston displacement, and so obtained about 125 lbs. initial piston pressure. This gave his motor a very smooth action, and prevented the extremely unpleasant "kick," or sudden forward impulse of the carriage which is so disagreeably in evidence when single cylinder motor driven wagons are running at slow speeds. Of course, this very large cylinder clearance and low initial pressure are unfavorable to fuel economy, but comfort and elegance of transportation go before fuel economy, when the loss is only a small fraction of a cent per mile.

#### Will Steam Engines Prevail?

Leaving the steam engine out of the play, there is no motor at present in sight which is so suitable for a road wagon as the gas engine, and it seems to me that the first step towards the best form of gas engine road wagon motors, is to multiply the cylinders to such an extent as to produce a continual torque; this gains two great advantages: First, the motor will drive the wagon strongly through mud or snow or uphill. Second, the cylinders need not be more than 2½ inch bore, and so can be perfectly safe without cooling water, if provided with

splash lubrication, all as is now a matter of common practice. Five cylinders appear to be the proper number to be applied to driving the wagon. Then, if electric ignition is to be used, it is probably cheaper and better to generate the current by means of a sixth cylinder and a little dynamo, than to try to drive the dynamo from the main engine shaft.

HUGH DOLNAR.

#### The London Motor Car Exhibition.

No striking novelties were shown at the recent motor vehicle exhibition held in Agricultural Hall, London, though there were several types of French cars shown, none of them, however, built on handsome lines. Speed, more than elegance, seems to be the great desideratum on the Continent. A Vallee car shown had a "low" speed of twenty-five miles and a high speed of forty miles per hour. Of course, it was only a box of machinery on wheels, and was intended for racing pure and simple. The workmanship of motor cars made in England was in advance of that of any of the imported cars, the Daimler models being especially noticeable for their attractive lines and finish. The show was unsatisfactory for the reason that the vehicles were not exhibited in operation, as at the recent Boston show, where the various contests were especially interesting.

#### Motocycle Hill Climbing Contest.

Paris, Dec. 4.—On Sunday last a motorcycle mounting contest was held in the outskirts of Paris at Chanteloup. The winner accomplished the ascent, a distance of 1,800 meters, in 3:52, representing a speed of thirty kilometers an hour, on an 11 per cent grade. The first three were: Jenatzy, electric automobile, 3:52; Jamin, Bollee tricycle automobile, 4:02 4-5, and Osmont, electric tricycle, 4:18 2-5. The race will probably become an annual event. The winning carriage is of the same type as the first cab put into service in Paris. The contest brought together almost eighty competitors.

#### Vienna's First Motor Cab.

The Egger-Lohner electric car is the first public motor vehicle to be introduced into Vienna. It has forty-two batteries, weighs half a ton, and has ninety-five volts capacity. A twenty-seven kilometer speed is claimed, with variations down to the merest crawl. A slow reverse drive is also possible, and the electric brake is stated to work instantaneously. The foot brake is for cases of emergency and also for cutting off the supply of electricity. The steering is by the back wheels, but this will be altered in the next cars, front wheel steering being substituted.

A company has been formed with headquarters in Paris to operate motor transportation lines in France. It has been granted authority to run omnibuses from Antibes to the Cape, from Nice to Mentone, from Nice to Fontain, and from Nice to St. Martin-Vesubie. Fares are fixed at the rate of 2 cents per kilometer.

Two motor wagons of six seats and six-horse power were sold in Paris, December 5, at public auction. Two hundred persons attended the sale. The wagons were bid in for \$2,050 and \$1,940 respectively.

The municipal council of Pau, France, has voted \$400 for the organization of an automobile race from Toulouse to Pau, in January.

# INFORMATION FOR BUYERS

## CHAPPUIS SEAT AND HANDLE CLAMP.

To obviate the necessity for using a wrench, either rightly or without the skill necessary to avoid rounding off nut corners and unsatisfactory tightening, and yet to permit the rider to make whatever handle bar or seat adjustments he desires without the handling of any tool or device separate

from the parts to be adjusted, E. H. Chappuis & Co., Marysville, Cal., offer their hand operated clamp. Thumb latches control all the movements and adjustments of the seat post, saddle, handle bar stem and bar, it being possible to raise either the seat post or the bar stem or to tilt the bar, or to move the saddle forward or back, by merely lifting the proper latch, making the adjustment and then releasing the latch piece. The clamps are slightly and the adjustments when once made are positive, being held by engaging corrugations which cannot accidentally slip. All parts are readily accessible and there are no springs which can rust and thus lose their value. The ease with which the bars can be entirely removed from the machine allows the rider to protect himself against

theft when he is compelled to leave his bicycle standing in public places by taking the bars with him.

## BIG SHIPMENT OF TUBING.

Quite recently the Shelby Steel Tube Co., of Shelby, O., shipped a carload containing 150,000 feet of tubing to one of its customers. It was the largest single car shipment of tubing ever made in this country or abroad. The stock was forwarded to the Chicago Handle Bar Co., which concern will use it exclusively in making handle bars. The value of the shipment was \$15,000, and the bill was discounted by the purchasers. The Shelby people have been given a contract by the same firm for another carload shipment, to be made early in January. The tube company's ability to handle such orders promptly is not surprising when it is known that the capacity of its mills is in excess of 54,000,000 feet of tubing a year. The company states that three days after an order for a carload of tubing is placed with it the shipment can be made, and that the three days' delay is not owing to unreadiness to deliver, but because that time is consumed in loading the stock into the car.

## J. P. THOMAS'S HUBS AND HANGERS.

Believing that there is a demand for bicycle parts of the best possible grade and which have features that recommend themselves to the builders of first class machines,

J. P. Thomas & Co., 439 Thirty-first street, Chicago, are placing on the market hubs and hangers for which are claimed superior easy running qualities and first class material and construction which make them desirable parts for those makers who do not sacrifice grade at the altar of expense. The feature of the bearing, as illustrated in the accompanying sectional view of one of the hubs, is the revolving sleeve. This sleeve is interposed between inner and outer rows of balls, the inner cone for the outer and the outer cone for the inner bearing being held by the sleeve. The sleeve rotates in the same direction as the hub barrel and has a speed of from 25 to 40 per cent of that of the hub, according to the accuracy of adjustment. The advantageous claim made for the sleeve is that by rotating within the hub it overcomes the resistance to pure rolling motion of the balls, which resistance in relation to ordinary bearings is termed sliding friction. The further claim is made that while dirt and hard stresses may cause the plain ball bearing to bind and drag, the revolving sleeve in the Thomas bearing allows that bearing to turn with equal ease under hard or light stresses. The construction of the hanger bearing is similar to that of the hub and both are made with view to avoiding the mistake of spoiling a good idea or principle with poor design and workmanship. The bearing is highly dust proof and needs oiling but once in a season. In exterior appearance the parts do not vary from standard patterns. It is stated by the makers that the bearing runs with from 25 to 40 per cent added ease over other bearings because of the fact that the revolving sleeve reduces the amount of sliding friction to

that degree. The hubs and hangers are now ready for delivery in both large and small lots, and are built to fit any ordinary bicycle. Choice of frame angles at the hanger bracket may be had.

## IMPROVEMENTS IN GRAHAM TIRE.

The Graham detachable tire, which can be cemented on to any crescent shaped rim instead of requiring a specially made rim with beaded edges or special grooves and mechanical methods of fastening, is a novelty in itself, but the Graham Tire Co., of Toronto, Canada, has now made this tire still more unique by putting several new wrinkles into use for next year. The most important improvement is perhaps the use of corkaline strips in the thick parts and in the flap which covers the central clinching groove, thus reducing the weight by 1½ pounds to the pair and at the same time making the tire even more easy riding than ever. The flap is now made a part of the tire instead of being cemented to the cover as last year, and a very thin wire runs from edge to edge all the way round, thus preventing any possibility of the flap curling and interfering with the inner tube. The clinching grooves are made more dovetail and when the tire is clinched it is impossible for it to come undone. Special rims are not required with the Graham tires, and since there is no side-wise splitting strain they permit the use of one-piece crescent rims. Manufacturers and repairmen will therefore find in them an economical way of fitting a detachable tire without making any changes in the rims. The numerous inquiries from manufacturers indicate a good season for the Graham company next year.

## IMPROVED TRICYCLE FOR CRIPPLES.

Since the wide adoption of the bicycle for other purposes than that of mere sport, pleasure or pastime, other branches of vehicle building have profited by the great advances that have been made in bicycle construction. A notable example is presented in vehicles for cripples, especially those who have full use of their arms but only limited use of their lower limbs. Up to a few years ago such machines were very crude, heavy, and so hard to operate that the rider could maintain but little speed. Now machines for cripples are being built which by having incorporated in them some of the features of bicycles furnish the cripple with means for easy and fairly speedy self transportation. A late vehicle of this type is shown in the accompanying

drawing. The machine was built in Miller's Repair Shop, 214 E. Ferry street, Buffalo, for the use of one of the proprietors of the shop who is himself a cripple. The front wheel is eighteen inches in diameter and the two rear wheels twenty-eight. The front sprockets have each twenty-four teeth and the rear sprockets each twenty teeth, thus gearing the machine to thirty-three and a fraction. The steering head being vertical

and the swing to the forks being backward, the steering wheel will run steadily with but little attention from the operator except when the latter wishes to make a turn, which he then accomplishes by the long steering rod held between his knees. Every precaution has been taken in building the frame to brace it thoroughly without adding unnecessary weight. The owner states that he has been able to run the vehicle at a speed of ten miles per hour on a smooth macadam street and to take some quite steep grades. The finish is in enamel and nickeling with striping and ornamentation, giving the machine the same appearance as regular cycle work. Other machines in various styles will be made upon order.

## NEW DEPARTURE COASTER AND BRAKE.

A coaster and brake device whose mechanism is contained entirely within the hub of the driving wheel of the bicycle has just been brought out by the New Departure Bell Co., of Bristol, Conn. The device is a modification and improvement of the well known New Departure brake which was put on the market in 1897, and adopted by many manufacturers. In the present hub the brake has been transferred to the left side and mechanism inserted in the right end which allows the wheel to run forward while the sprocket remains stationary, constituting the coasting device. Every action is automatic and there are no levers, toggles or connections to operate by hands or feet. When the rider wishes to coast he simply stops pedaling and keeps both feet on the pedals and may resume pedaling at will without the pedals jumping forward, all the while having control of the machine through the brake. By a slight backward pressure on the pedals the brake is applied and as soon as the pressure is removed

the brake is automatically released. The braking action is always positive and uniform, whether on dry or wet roads, as the mechanism is wholly within the hub where it cannot be affected by external conditions. The bicycle can be wheeled forward or backward whether the coaster is "on" or "off," and there is no change in appearance and action from the ordinary bicycle. The hub is the same size as regular hubs and can be assembled in the wheel in the usual manner, so that it can be applied to various makes of bicycles economically and with no change in the frame or crank hanger mechanism.

## CHANGE IN LEAGUE TIRE AGENCIES.

The New York Belting & Packing Co. has arranged with A. G. Spalding & Bros., 147-149 Wabash avenue, Chicago, Ill., to act as their distributing agents to the trade in the west and middle west. Spalding & Bros. will attend to all replacements and repairs of League tires sent to Chicago. This arrangement does not apply to bicycle manufactur-

ers, whose trade will be handled as hitherto, by the New York Belting & Packing Co. direct through the New York office. A similar arrangement has been made with George F. Kehew & Co., 129 Pearl street, Boston, Mass., to represent the League tires to the trade in New England and to attend to all repairs and replacement for that section. Manufactures will continue to be handled direct by the N. Y. Belting & Packing Co. from their New York office.

#### PUSHING "FAULTLESS" ROLLER BRAKE.

The Sundry Co., of Baltimore, Md., is actively pushing for the coming season the new models of its "Faultless" roller brake, which,

while the principle of construction remains the same as formerly, has been improved upon in the matter of workmanship and finish and is now offered in a durable and very attractive form. The brake body, both for the foot and hand patterns, is made of one piece of spring metal which is clamped to the forks by a simple positive clamp. The frame carries a hard rubber roller which presses on the tire when the brake is in operation and spins on its axle, the motion being communicated by the tire. The brake shoe strikes the roller on its top and gradually slackens its motion, thus also retarding the motion of the wheel, but without causing a harmful friction between the roller and tire. The Sundry company also lists a one-piece coaster which is attached to the forks

by a clamp similar to that used on the brake. Prices on both brakes and coaster have been reduced.

#### THE NEW TUCKER RIM PLANT.

The Tucker Wood Rim Works at Urbana last Wednesday bent the first rims since its removal from Roachdale, Ind. There are 27,000 strips in the factory to commence work with, and 200,000 more ready for shipment from Roachdale as soon as they could obtain cars. Fifteen experts are now at work, and a number of others will come as soon as they finish some orders upon which they were at work at the old factory. In all fifty men will be employed this season at the new factory. Orders for 100,000 pairs of rims are on hand and the factory will, in all probability, have all it can do to get them out, as moving has caused some delay. The plant occupies two buildings, the main one being a two-story structure, 100x50 feet. Both stories of this building are occupied by machinery for binding, planing and sanding rims. The other building is two stories in height and 30x46 feet in size. The first floor is used for packing and shipping and the second for the finishing department. In the power house are two 75-horse power boilers and a 165-horse power engine. In the rear of the main building is the drying kiln, containing four compartments, each 40x8 feet, and each independent of the others. The buildings are lighted by electricity, furnished by a 150-light dynamo, operated by the company's own power. The plant is very complete in every detail. J. B. Tucker, president of the company, and Harry Putnam,

secretary, are the managers of the concern, which promises to add a thriving industry to the little city of Urbana.

#### MORRIS FITTINGS CO.'S LINE.

Three models compose the '99 line of the S. G. Morris Fittings Co., 70 E. Prospect street, Cleveland. Model A, the highest priced machine, lists at \$50, and has 30-inch wheels, 46 inches wheel base, and a 4-inch drop of the hanger. The specifications are standard and the options liberal. The Model B, which is to be retailed at \$35, has the same general specifications as the Model A, but has a 48-inch-wheel base, 2½-inch drop and 28-inch wheels. The third model, C, is made in standard heights of frames, is equipped with Akron India Rubber Co.'s 3M guaranteed tire, Fairbanks-Boston one-piece rims and is sold so that it can be retailed at \$25. The machines are fitted with either the Fauber or the Modan hanger. The company is ready to deliver these machines promptly and is also prepared to furnish the fittings from which to build them.

#### NEVERSLIP NIPPLE GRIP.

A new thing in nipple wrenches is the Neverslip grip illustrated herewith, just being placed in the market by the Buffalo Specialty Mfg. Co., 1445 Niagara street, Buffalo. This wrench is of entirely new form, being cast hollow of steel with a longitudinal tapered slot for the reception of the spoke. The face is slightly convex so that the operator can get a grip on a nipple that protrudes only a little way through the rim without scratching the enamel with the edges of the wrench. The jaws are hardened and will take any size of nipple. The

whole device is nicked and the face polished. The bulb end is made of a size to just fit the hand, and after the grip has been placed on the nipple it is easily revolved by the fingers until the proper tension is secured without readjusting. The makers pack the Neverslip in counter display boxes containing a dozen each.

#### WANT TO CATALOGUE PARTS.

The Sidney B. Roby Co., 67 Mill street, Rochester, N. Y., an old and well established firm of jobbers in saddlery and coach hardware and of steel and iron, has decided to handle a complete line of frame fittings, parts and sundries, and is now completing arrangements with several manufacturers of these goods to job their product. The Roby company will soon issue a catalogue and invites correspondence from parts makers who desire representation in that vicinity.

#### SIDWAY SPECIALTIES FOR 1899.

The Sidway Mfg. Co., 240 Lake street, Chicago, has added a new article to its line of cycle sundries in the form of a combination pedal and stirrup toe clip. The new pedal comprises a plain round barrel in which the pedal pin is mounted on three-point ball bearings of usual construction. Secured to the barrel is a flat plate with a backward tongue extension bent downward on a curve. An extension riveted to the

forward end of the plate carries an S. & G. stirrup toe clip. The combination pedal is readily caught by the foot, it being raised to a riding position by means of the tongue at the rear of the plate. At either side of this tongue saw teeth are formed at the edge of the plate, thus helping the long, flat bearing afforded by the plate to hold the foot securely against slipping on the pedal. The stirrup clip offers the same advantages in the way of being sufficiently yielding not to cause pain to the foot and yet rigid enough to allow the rider a firm pull in hill climbing as does the regular S. & G. stirrup clip, with the added advantage of insuring

against any possible loosening of the clip from the pedal. The pedal as well as all of the stirrup clips for the coming season is furnished in three sizes, accommodating shoes running from No. 5 to No. 10 in size, and the leather stirrup on all clips is furnished in either russet or patent leather. Besides the combination pedals and the stirrup clips the Sidway company also catalogues the S. & G. spring grips which afford resiliency under the pressure of the hand for their entire length, and a direct saddle clamp intended for use on machines in which the frame is too high to allow comfort to the rider when the saddle is secured to the seat post in the usual manner.

#### STOCKTON HUBS AND PEDALS.

The Stockton Mfg. Co., of Newark, N. J., is looking for '99 business with popular goods at popular prices. The well known

Gem hub, which is the company's finest and which was widely indorsed last season, is similar in appearance and principle to the previous pattern. The barrel is turned from solid bar steel and is equipped with bearing parts, the main features of which are the oil reservoir, which makes oiling necessary only once during a season, and the device whereby the balls do not fall out when the axle is removed. Acting upon the ground that "nothing succeeds like success," the Stockton company appreciates the success of its Leader hub during '98 and runs it again for '99. The Gem pedal is distinguished by the bearing locking device which makes it impossible for the cone to move in either direction after the adjustment has once been made and the locking nut tightened. As shown in the illustration, the flange of the cone is notched, the notches engaging corresponding notches in the flanged washer which is held from turning on the axle by a

small interior projection entering a longitudinal groove in the axle. The ball cup sockets and the frame cross arms are drawn in one piece, thus making the loosening of the cup seats impossible. The hub and pedal line is supplemented by the Stahl repair chain links, which have been previously illustrated and described in Cycle Age. They are made in two sizes and are sold in both small and large lots.

#### CHAINLESS UNION WHITEHEAD.

The Union Cycle Mfg. Co. of Highlandville, Mass., will continue the manufacture of the Union Whitehead, with some decided improvements and the best equipment throughout. The list will be \$65. The Union Redhead for '99 is the new member of the line and will be built on much the same style as the Whitehead, having flush joints at all connections; expander fittings to handle bars and seat post; drop forged arch fork crown of a new, light design; Fauber pattern one-piece cranks, and axle of home manufacture, with several previous objectionable features eliminated; best quality Excelsior spokes; Kundtz rims; adjustable or stationary handle bars; Record pedals, and a finish of lustrous black or Brewster green enamel. The list price of this machine will be \$50. The Whitehead will also be built in a chainless pattern, in which the Sager roller gear will be used, the company being convinced that it is the best form of chainless cycle gear extant. Speaking further on the subject, President Stokes says: "Its speed and easy running qualities have been fully demonstrated by Major Taylor in his recent record-breaking feats at Philadelphia. This gear develops the

## STERLING CYCLE WORKS, KENOSHA, WIS.

least amount of friction. It accomplishes what no form of angular gear has done, viz., showing but the friction of a roller and at the same time having the teeth in contact with the roller along their entire length, thus affording an abundance of wearing surface. In all other forms of angular pin gearing the point-contact alone has been secured, the rollers crossing each other as they mesh, and the point of contact being very small, the wear is correspondingly great. In the bevel gear, the surface of the teeth being sharply inclined, they have a pronounced tendency to force themselves out of mesh when under pressure, and the metal surfaces must rub past each other to allow a tooth to enter into mesh, thus adding materially to the friction. The roller gear, having a much more gradual tooth inclination, overcomes the wedging tendency and permits the rollers to revolve into mesh very easily. The roller gear is not nearly as delicate a mechanism as the bevel gear. It is not necessary to advise riders to let it alone as cautiously as they would the works of their watches. It can be as easily adjusted as a chain. We will be in position to furnish roller gears in almost any size, varying from 66 to 108, or even higher if wanted. With an ordinary bevel gear it is almost impossible to change the gear, and it can only be done by sending the machine back to the factory. With the Sager roller gear any rider can have several gears and change them himself in a few minutes without any difficulty. The changes are made by substituting sprockets which are secured to the hub in the same manner as the sprockets of an ordinary chain bicycle." The chainless Whitehead will list at \$75.

#### THE BUESCHER SPECIALTIES.

A toe-clip that will not work loose and turn on the pedal is made by the Buescher Mfg. Co. of Elkhart, Ind., and is shown in the first drawing herewith. It has three bolt holes so that it can be attached to the side-plate by two bolts or by one when there is but one hole in the pedal plate. Another Buescher clip has wings reaching down on either side of the foot to prevent side motion of the shoe. The company's No. 3 toe-clip, which is radically different in principle from these and others on the market, was illustrated and described in Cycle Age of October 20. Another new article com-

THE CYCLE AGE

prised in the line of specialties is the No. 3 instantaneous pump coupling described November 17. A floor pump of new design, though practically similar to Nos. 2 and 9, has been added to the line and designated as No. 16. It has a 22-inch barrel of 1 1/8-inch diameter, having a cast base and three feet of hose. Quality of material and workmanship rather than novelty of form is the claim upon which the company is soliciting and securing business.

#### UNIFORM TEMPERING METHOD.

The main difficulty in tempering small articles of steel by flame, forge or furnace heating is due to the necessity of keeping the heat applied within the narrow limits of 700 and 750 degrees, so that the article to be tempered may be neither hotter nor colder than this temperature when dropped in oil or water. This difficulty has led to the use of lead alloys that fuse at the desired temperature for conveying the necessary heat to the steel. The method is described by the Lozier manufacturing company in its publication, On The Square, being applied to the tempering of ball cups and cones for Cleveland bicycles. Each ball cup is immersed in a pot of molten lead and held there until it has become heated through and through to a cherry heat. It is then quickly taken from the molten lead and dropped into a tank of cold oil. This tank of oil is surrounded by a jacket of cold running water which keeps the oil cold and of the same temperature at all times. "The object in tempering ball cups," says the company's writer, "is to make them so hard that the balls will not wear grooves in them, but at the same time they must not be so hard as to be brittle and crack, crush or crumble under heavy strains or jars. Case hardening simply tempers or hardens the outer crust or shell of the cups and the tempering is frequently uneven. If the cups are not left in the ovens long enough this crust of hardened metal is so thin that it is liable to allow the balls to crush through into the soft steel. On the other hand, if the cups are left in the ovens too long the tem-

pering is too severe, and the cups become brittle and will break. For this reason case hardened cones depend for their quality entirely upon the skill of the operator, and while some are good, many are defective and imperfect. But by the process of lead tempering, the cups can not become any hotter than the molten lead in which they are immersed, no matter how long they are left in it. The molten lead gradually heats the cups through and through and as they are taken from the lead and dropped into cold oil they are slowly tempered almost to the core. Every Cleveland ball cup is tempered exactly alike. There can be no bad ones. After tempering the ball cups are ground true to correct the warping which is a frequent result of the tempering process, but even a perfectly ground cup will not permit absolutely accurate adjustment in the hub unless the cup in the opposite end of the same, besides being equally perfect in itself, is also equivalent at all points with the corresponding points in the first cup. If this condition is not observed the cones must be left loose enough to allow for wobbling." The Cleveland people therefore make it a point to grind both cups at the same time after they are placed in the hubs, using a special machine for this purpose.

#### RICHARDS DETACHABLE SPROCKET RIMS.

The Richards sprocket rim for raising the gear of a bicycle is made in sizes which permit the raising of any sprocket from three

to five teeth, as may be desired. The rim is held on by its own wedging power, the groove in which the teeth of the original sprocket fit being cut on a taper. When the rim is being placed in position the only work necessary is to hold a piece of wood on the teeth of the rim and to drive with a hammer till the rim is wedged tight in place. Three countersunk set screws are then screwed down through holes provided in three of the rim teeth, these screws being not for the purpose of wedging the sprocket, but merely to insure against the loosening of the rim by back pedaling. The rims are made to fit 3-16, 1/4, 5-16 and 3/8-inch sprockets. A screw driver and two extra links of chain are furnished with each rim. Tower & Lyon, 95 Chambers street, New York, are the sole eastern selling agents of the rim.

#### THE NEW KIRKPATRICK SADDLES.

Since 1883 T. J. Kirkpatrick has been an exponent of the hammock saddle, and up till about 1893 the Kirkpatrick saddle was a familiar sight on all kinds of bicycles. The latter day demand for comfortable saddles and the widespread attention that has been given to the production of seats which relieve bicycle riding from the disagreeable feature of saddle soreness and other harmful effects has led Mr. Kirkpatrick to again bring forward the hammock principle and incorporate it in saddles which are up-to-date in appearance and in keeping with all of the modern requirements in saddle design and construction. The new Kirkpatrick saddles, which have been on the market during 1898, are being pushed harder than ever for

the coming season and the maker, the Kirkpatrick Saddle Co. of Springfield, Ohio, feels confident of rapidly increasing business. A second edition of the booklet, "Scientific Saddle Making," in which the principle of the hammock saddle and its relation to the jars and jolts it is intended to compensate are carefully figured out and placed before the reader in mathematical form, has been issued and is being mailed to the trade. Several forms of Kirkpatrick saddles, all built on the double spring hammock principle, but varying in the shape of tops and the form of springs, are offered for '99. The standard pattern is here shown.

#### GROWTH OF NATIONAL CEMENT & RUBBER CO.

E. P. Hubbell, secretary, treasurer and general manager of the National Cement & Rubber Mfg. Co. of Toledo, O., has tendered his resignation as assistant cashier of the Second National Bank of that city, to take effect January 1, and will thereafter devote

his entire time and attention to the rapidly growing business, of which he now owns the controlling interest. The concern now occupies the entire five floors of one of the largest buildings in the city of Toledo, and has agencies in every prominent city in the United States. It also has well established trade in South Africa, South America, Sandwich Islands, and the principal countries of Europe. A branch house has been established in Paris, which is under the management of Elie Weill & Co., who are regularly authorized agents.

The National Cement & Rubber Manufacturing Company sells only to jobbers. It has several salesmen on the road, and states that trade of late has shown a most remarkable increase. The company is to have 100 feet of floor space at the Paris exposition for an exhibit which will be in charge of Elie Weill & Co., and will also occupy space No. 169 at the New York show, and have space at the Philadelphia and Chicago shows.

#### BRECKENRIDGE GAS LAMP DETAILS.

The E. P. Breckenridge Co., Toledo, has placed on the market and is now ready to supply the trade with its new acetylene gas lamp, the construction and action of which were described in Cycle Age in the issue of September 29, at that time the first practical models of the lamp having just been completed. The lamp, a sectional view of which is here shown, is notable on account of the introduction of several features which aim to make generation of acetylene gas

more applicable to and convenient in cycle or carriage lamps. Loose carbon is placed in the lamp in such form that it can be entirely removed from the lamp body by simply lifting out a small tube to which is attached a disk supporting the carbide. The removal of the residue carbide after the supply has become exhausted is thus the work of a single, simple and cleanly operation. The burner tip is arranged to give a broad fish tail flame the light from which is thrown through the lens at an illumination angle of 60 degrees. The water reservoir is back of the combustion chamber and discharges the water through a bent tube running to the bottom of the carbide receptacle. The flow of the water is regulated by a valve which renders it impossible for the water to reach the carbide faster than drop by drop. The water acting first on the carbide at the bottom of the holder, the generated gas passes through the unused carbide before it escapes through the burner, thus being relieved of what moisture it carries and producing a dry and highly volatile gas. The Breckenridge company also manufactures one model of oil lamp which has features selected from the various successful oil lamps formerly made.

#### HOW EQUIPMENT AFFECTS SALES.

How much the equipment of a bicycle affects its appearance and sale is not even yet generally realized. Many a sale is made or spoiled by the looks of the saddle, handle bars, tires and pedals. If these are light,

# Plain Talks on Andrae Cycles

THEY NEVER DISAPPOINT

... I ...

Ever since bicycles have been on the market Andraes have been ridden.

There are few for sale second hand.

Those sold five years ago are being ridden to-day—giving perfect satisfaction.

In five years a good bicycle will make many friends.

An agent wants to sell a popular wheel—it's easier.

We are continually looking out for the welfare of our agents—doing this and doing that to help them sell Andraes.

It's to our advantage to do so.

This year we have the finest line of wheels an agent can get.

14 Models—\$30 up—he needn't lose a sale.

We know there are some people in every town who will not ride any wheel but the Andrae.

If they cannot buy it at home they will buy it somewhere else.

Is there an Andrae agent in your town?

Do you want a money-making proposition to take it?

Mention The Cycle Age

graceful, well finished, yet strong, they lend an additional value to the machine that can hardly be overestimated. Unfortunately all fittings placed on otherwise attractive bicycles do not incorporate these features. When a saddle, pedal, or other fitting does possess them, however, its field is much broadened and it has qualities upon which there are possibilities of working up unlimited trade. This is the idea the Hollenbeck Saddle Co., of Syracuse, N. Y., is working on with its new Rawhide saddle, and the truth of the observation is well proved by the quick success that has been met in placing it among makers of high class bicycles. The Hollenbeck company announces that the following well known concerns will fit the 12-ounce Rawhide either regularly on certain models or as an option: E. C. Stearns & Co., Barnes Cycle Co., Buffalo Cycle Mfg. Co., Heinz & Munschauer, R. H. Wolf & Co., Julius Andrae & Sons Co., Eclipse Bicycle Co., Carlisle Mfg. Co., Magnet Cycle Co., Peoria Rubber & Mfg. Co., Bettys & Mabbett, Bean-Chamberlin Co., Snell Cycle Fittings Co., Olive Wheel Co., Davis Sewing Machine Co., George N. Pierce Co., Sterling Cycle Works, Utica Cycle Co., Kirk Mfg. Co., Viking Mfg. Co., Manson Cycle Co., Ben Hur Cycle Co., Rochester Cycle Co., Northway & Kingsbury, Aluminum Bicycle Co., Ariel Cycle Mfg. Co.

#### COMPLETE LINE OF BEVIN BELLS.

The Bevin Bros. Mfg. Co., of East Hampton, Conn., shows in its cycle trade catalogue a large line of bells, trouser guards,

THE CYCLE AGE

toe clips, spring oil hole covers, foot brakes, nipple grips and lamp brackets. The Bevin Special, made in four patterns, is the highest priced bell listed by the company. It has an electric stroke, rotary movement and is entirely finished in nickel. The mechanism and base are of brass. As illustrated, two forms of clamping devices are used and the gongs are made both with plain and with ribbed joints. Some of the cheaper pattern bells have simple, positive, ratchet movements, instead of the rotary, though the stroke and the sound are similar. The lower illustration shows one of these movements. Tire and spoke operating bells and continuously ringing chimes are also included in the bell line. Of the many patterns of toe clips presented that illustrated here is the most notable. It is made of one piece of steel and has some of the features of the stirrup clip. The sides are yielding and flexible,

THE CYCLE AGE

causing no painful pressure on the foot. It is made in both gentlemen's and ladies' sizes.

#### BOOM IN ROLLER SKATE INDUSTRY.

An evidence of the growing interest now being manifested in roller skating is the fact that the Henley Bicycle & Roller Skate Works of Richmond, Ind., operating the largest factory for the production of these goods in the country, are running night and day to fill orders for the popular Henley skates. The company reports a larger demand during the last 30 days than has been known for many years, arrangements having been made to open a great number of rinks between Thanksgiving and New Year's, to supply which has taxed the great capacity of the Henley works to the utmost. A number of very fine rinks have been opened in

large cities and stocked with Henley skates, and numerous smaller ones have been supplied all over the country. The demand is unprecedented except during the palmy days of roller skate excitement of '79 to '86, and it now seems possible that this reawakened enthusiasm will exceed that in former years referred to and last for a number of years. M. C. Henley is personally interested with others in the operation of the elegant Main street rink in his own city, Richmond, Ind., which was opened recently with success; more than 1,200 paid admissions being received the first evening. This has been running every week day since, both afternoon and evening, and in the morning of two days, with the interest and attendance constantly increasing. Reports show that these conditions have been repeated in other places, rinks having been opened within the past fortnight at Indianapolis, Baltimore, Milwaukee, Evansville, San Francisco, Chicago, Oshkosh, and many smaller places, all of those so far opened having met with success beyond the expectations of the management, the attendance at all fully equaling that of any former year. The hardware trade are handling these goods largely, and many jobbers are putting in large stocks of Henley skates since it has become a settled fact that the business has not only revived, but will be a permanent one for a few years at least.

#### JOBBER'S OF FRAME SETS AND PARTS.

An advance catalogue of complete frame sets for four models of bicycles, and of individual parts and fittings, including the Fauber hanger, independent seat post and handle bar expander, Weston & Co.'s Champion hub, Watson Automatic seat post, Brennan adjustable handle bar, Young's sprocket rim, O. S. and Syracuse pedals, Olmsted saddles, Adams vise, Spot Cash vulcanizer, Invincible brazer, P. D. Q. enameling oven, Schrader valve, transfers, grips, stamped connections, chain adjusters, fork crowns, etc., has just been issued by R. H. Olmsted & Son, 413 South Clinton street, Syracuse, N. Y. This constitutes a handy reference catalogue of all that is needed for the assembling of bicycles. In January this firm will get out a catalogue of bicycle sundries which will be distributed widely, and would be pleased to hear from manufacturers who would like to have their goods listed.

#### BALL BEARING CYCLE HOLDER.

The Bristol Bell Co. of Bristol, Conn., is offering for a second season its ball bearing holder with which bicycles can be held

THE CYCLE AGE

by the rim of a wheel without the slightest danger of the varnish on the rim being scratched. As seen from the illustration the holder, which is constructed to be screwed to a wall or post, has clamping arms fitted with rubber balls. These balls are the only parts of the holder which touch the rim of a cycle being supported. The operation is entirely automatic and the attaching frame is made so that the holder can be adjusted to any desired angle. The holders are finished in full nickel, nickel and enamel or in Tuscan bronze.

#### NATURAL ELASTICITY IN FRAMES.

Comfort in riding and simplicity in construction are seldom intimately associated in bicycle manufacture. Therefore, when these two indispensable qualities are successfully combined with strength and accuracy, the resulting construction is of the greatest interest, not only to the rider but to the agent as well, for the latter's profits are largely cut into if the machine's handles fail to stand up and are continually requiring adjustment or small repairs. Moreover, increased comfort to the rider insures a well pleased customer. During a period of nearly three seasons a form of construction embodying the good features mentioned has been receiving the only absolute test of a bicycle at the hands of hundreds of riders in every part of this country and in many foreign countries. This is a rigid, resilient bicycle frame in which jar and vibration are eliminated, but not at the expense of simplicity or weight. This result is attained not by the addition of some complicated device, but through qualities inherent in the frame itself, which is claimed to be stronger than an ordinary frame, though it weighs no more, and in which buckling is impossible and a breakdown out of question. That none has ever occurred is, perhaps, the best prom-

ise for the future. The natural elasticity and strength of the hickory used in the construction of the Chilion bicycles are responsible for the comfort and durability of these machines, whose makers, the M. D. Stebbins Mfg. Co. of 48 Hampden street, Springfield, Mass., announce that the '99 machines will rank with the best in quality of materials and workmanship. Mesinger saddles will be regularly fitted. None but Cleveland Machine Screw Co. balls will be used. The other details will correspond in grade. The chains used will be of special accuracy, with sprockets milled to fit. A two-piece crank and shaft of remarkably simple construction and the Chilion unbreakable fork crown are other attractive features. The finishes are handsome as well as novel in appearance. They are a distinctive feature, though conspicuous only for their beauty. Accuracy of bearings and of sprockets and chain give easy running qualities. In every detail these machines will show the careful study that has been devoted to the production of as good a bicycle as can be built.

#### IMPROVED PUMP COUPLING.

The instantaneous and effective coupling device for clamping the end of a pump hose to the valve of a tire here shown is an improvement on the one first brought out a year ago by J. E. Boucher and E. P. Wolf of Chicago and is to be sold the coming season by Robert Malcolm, dealer in bicycle

THE CYCLE AGE

materials and sundries at 115 Lake street, Chicago. The clamp is intended for use with foot, floor and power-pumps. The free end of the hose extends through the clamp to the end of the nozzle. The hand piece acts as a lever to draw backward the ring encircling the nozzle, which, being beveled internally, forces together the six portions of the chuck part formed by the long kerfs. These press upon the inclosed rubber hose end and bind it upon the valve and valve stem in an air tight connection. Raising the lever by means of the thumb ears provided readily releases the clamp. The device is stamped out of white metal and is non-rusting.

#### CHANGE IN INDUSTRIAL CYCLE CO.

The Industrial Cycle Co., Wilbraham road, Springfield, Mass., is preparing for an increased output the coming year under slightly different management from that of the past season, Rev. D. A. Reed having sold his interest in the company to the other two members of the firm, D. T. and A. C. Methven. The company was formed three years ago and has been rapidly enlarging its business ever since. The output for '98 was 6,000 bicycles. Plans are being made for the manufacture of 10,000 machines for the coming season, orders now being on hand for 4,000. Some new machinery and equipments will be added to enable the increased output to be handled.

#### SCHRADER ADJUSTABLE SPANNER.

The utility of the spanner in separating and assembling certain bicycle parts is so widely conceded that the adjustable span-

ner wrench manufactured by Frederick Schrader, East Side Station, Bridgeport, Conn., becomes a likely aspirant for popular favor, both among shopmen and riders. The spanner has a curved end which carries a hardened steel pin to enter the spanner notch in the part to be moved. A strong set-screw passing through the body at the point of tangency between the curved and straight portions allows the circularity of the spanner arc to be varied to suit the cup or ring to be turned. The spanner will

operate on rings from 1 inch to 2¼ inches in diameter. The tool is polished and nicked and is small enough to go into the ordinary tool bag.

#### STEARNS CATALOGUE OUT.

The "Yellow Fellow Year Book," being a treatise upon the construction, equipment and prices of the eleven 1899 models of Stearns bicycles, is just off the press and still redolent of the black and orange inks in which it is printed. It is arranged and set up in the attractive style which characterizes all the trade literature that emanates from this house. The half-tone plates of the machines are printed in two colors from wash drawings by Bartlett & Co. A feature of the booklet is a double page illustration showing the mechanism of the bevel gears of the chainless, the crank nanger of the chain driven machines, the Stearns internally clamping seat post, the detachable grip and the Stearns automatic locking stand used in three different positions.

#### TOLEDO METAL WHEEL CO.'S NEW LINE.

The Toledo Metal Wheel Co., Station B, Toledo, are building machines for adults as well as juvenile bicycles for the season

of '99. The former line comprises men's and ladies' patterns listing at \$50 and \$52.50 respectively. The upper illustration shows the ladies' model which in general construction is similar to its mate. The machines have flush joints, tapered D shaped rear forks and a 2½-inch drop to the hanger. The frames are finished in either black or maroon enamel, the first coat of which is

an anti-rust enamel which prevents the tubing from rusting and causing the enamel to scale off. The hangers are of the Fauber pattern with especially designed sprocket. Expander clamps are used for securing both the seat post and the handle bars. The front forks have the best quality of brazed steel sides with nickel plated arch crown. The other leading specifications and options embrace popular features and fittings. The "Favorite" juvenile machines, a boys' and

girls' model of which are illustrated, are made in three sizes, having respectively 24 and 26-inch wheels. The weights run from 18 to 22 pounds, and the prices are \$20, \$25 and \$30. All of the frames have flush joints at the steering head and seat cluster, and D shaped rear forks are used. The hanger is fitted with means for oiling direct to the bearings, and has a three-piece crank and axle arrangement which is strong and in proportion to the other reduced sizes throughout the models. Plain steel drop bars are fitted to the boys' models and up-turned to the girls' patterns.

#### MANIPULATING DOUBLE TRANSFER PAPER.

All of the "double paper" transfers made by the Meyercord Company of Chicago have printed on the back the words: "Varnish transfer as usual, then remove the tissue paper and transfer by wetting the back." By an examination of all sheets thus marked it will be found that the paper consists of a very thin tissue paper attached to a heavy paper. When transferring, probably

the quickest and best way to handle, will be to varnish the sheet or varnish as much of a sheet as is necessary for immediate use, then cut apart, place the ornament on the frame in its position and press thoroughly to the frame, then soak with water, and peel from the edge, tearing the thick paper from the thin and leaving the thin paper with the ornament on the frame. Then wet the thin paper and the transfer will transfer very easily and perfectly. This is the best way to handle and probably the most satisfactory, but the whole sheet can be varnished and the thin paper stripped from the thick in sheet form and the ornaments cut apart and transferred on just the thin paper.

#### MYERS COMBINATION CYCLE STAND.

ages of a light folding cycle support for exhibition and other similar purposes, with a strong, efficient home trainer, has become very widely known and has been granted the compliment of a wide use. The stand is made of flat spring steel and weighs but 4½ pounds complete. It can be attached to either the front or the rear wheel and when once attached cannot be shaken off. As the stand interferes with no running part of the bicycle it is well adapted for show purposes in a cycle store and also as a cleaning stand for individual riders; and being strong enough to support a 300-pound man, the home trainer attachment possesses a double field of practical usefulness. One of the newest attachments which have been devised to go with the stand is an adjustable truing device by means of which the work of truing up a bicycle wheel without removing it from the frame is very readily accomplished. The stand with its attachments is manufactured by F. E. Myers & Bro. of Ashland, O., who also make and market other forms of cycle stands, among them being an independent cycle holder for holding machines in the home or office during the times they are not in use, a display stand for supporting bicycles at a height of eight, ten or twenty inches from the floor, and a cycle rack for use in front of stores, etc. The display stand is made in two separate parts which allows its use, without adjustment or tinkering, with machines of all lengths, including tandems. The nuts on the axles do not need to be removed to place a bicycle on the stand. All of the stands are given an attractive aluminum finish.

#### HANDY REFERENCE FOR PARTS.

The Toledo Cycle Supply Co., 431 St. Clair street, Toledo, selling agents for Crosby & Mayer Co.'s fittings, is sending out a sheet of fittings and parts, with specifications, to be pasted on the wall of the shop as a ready reference. Four diamond and one drop frame are shown in working drawings with measurements and angles given. These include a 23-inch frame for 30-inch wheels with 4 inches drop of hanger, a 22-inch frame for 30-inch wheels with 3 inches drop, a 22-inch frame for 28-inch wheels with 3 inches drop, a 24-inch frame for 28-inch wheels with hanger dropped 2½ inches, and a drop frame model of 22 inches height, 28-inch wheels and 3 inches drop. The parts shown include one and two piece hangers, one-piece stamped head, drop forged fork crown, four-lug seat post cluster, full set of head fittings, handle bar and seat post expander, fork sides and rear stays and chain adjuster. The company will have its large and complete catalogue of fittings and sundries ready for distribution January 1.

#### SALAMANDER FOR CHAIN ILLS.

E. G. Eager & Co., jobbers of cycle sundries and sporting goods, 334 Superior street, Toledo, O., are general distributing agents for Elfin juvenile bicycles for Ohio, Indiana, Michigan and the entire south, Pacific slope and the northwest, and are also sole selling agents of Salamander chain lubricant. This lubricant, they state, will cure all diseases that the chain is heir to; is not affected by heat or cold, will not collect dust, and will go direct to the seat of the complaint and make a stiff joint limber and full of life. It is not a new, untried article, but has been on the market in and around Toledo for the past two years. A number of large jobbers are cataloguing it for '99 and the company is prepared to furnish electrotypes to others who desire to list it among their supplies.

#### LITTLE INCONVENIENCE WILL RESULT.

In the Cycle Age Trade Index recently issued the address of the Grant Ball Co. is given as Elyria, O. The factory and general offices are located in Cleveland, a fact so well known to the trade that the error will cause less trouble than if the company were a less prominent one whose name was not on the books of so many leading manufacturers. All mail should of course be sent to Cleveland.

#### IS MADE BY BULLIS BALL GEAR CO.

The ball gear described and illustrated in last week's issue of Cycle Age is being put

on the market by the Bullis Ball Gear Co., of Rochester, instead of by the Miner & Fisk Co. as stated. A. J. Fisk, who has been successor to the Miner & Fisk Co. for the past year, is manager of the Bullis company, which will exhibit this novel gear mechanism at both the New York and Chicago shows.

#### NUTLESS FASTENING FOR SADDLE SPRINGS.

A new method of fastening the spring ends to the base at the cantle of a bicycle saddle is being adopted this season by Cutting, Kaestner & Co., 241 South Jefferson street, Chicago. The scheme is so simple that it is unnecessary to supplement the accompanying drawing with a description. The little metal pockets or eyes having been pressed into place in the square holes in the metal base, they are covered with leather, giving a smooth finish to the under side of the base plate and doing away entirely with the customary nuts. After the base has been padded and covered with leather, the laterally extending ends of the spring are sprung into place in the pockets. The peculiar new washer used at the pommel is positive in action and prevents any movement of the

front part of the spring. The saddle clamp normally keeps the two sides of the spring pressed apart and prevents any possibility of the ends of the springs coming out of their sockets. By the recently noted increase of floor space and addition of machinery the company has increased its capacity to easily 2,000 saddles per day and already has many good orders on its books, having invaded this season for the first time the territory east of Buffalo. Last year the company sold more than 150,000 saddles and anticipates a very greatly increased output the coming year, as it can devote to the manufacture of its bicycle saddles, tool bags, leather belts, etc., a greater proportion of its attention which last season was conferred upon immense government orders for horse saddles, pistol holsters and sword scabbards. The '99 catalogue of Cutting saddles shows nearly thirty models for manufacturers to select from. An exhibit will be made at the Chicago show by the company.

#### REPAIR CHAIN LINK.

The accompanying illustration shows the detachable repair chain link designed by the Indiana Chain Co., of Indianapolis, to take the place of a broken center link in any chain. It can be put in without the use of tools. It will also replace the old style bolt

and nut in any chain by breaking off one link. These links will be mailed direct to the rider at 25 cents apiece.

#### TRADE NOTES.

J. J. Henson, for two years superintendent of the Iroquois Cycle Co., of Chicago, has taken the position of superintendent of the Acme Cycle Co., of Elkhart, Ind.

The Iver Johnson Arms & Cycle Co. has secured the services of Fred I. Blake as superintendent of the Fitchburg factory. Blake was for many years superintendent of the Spiers bicycle works at Worcester.

The Strauss Cycle Supply Co., 334 Genesee street, Buffalo, has contracted with a number of manufacturers to handle their goods exclusively, among them being the Fauber hanger and Strauss tire. A full line of sundries will be carried.

# THE WHITE

THOU HAST SPOKEN RIGHT, 'TIS TRUE,  
THE WHEEL HAS COME!

Shakespeare (King Lear).

The experience of the past season has demonstrated that the era of the high-grade wheel has returned. THE WHITE is the best-made wheel in the world. Ask at any REPAIR SHOP and you will learn less about THE WHITE than about any other wheel.

**THIRTY-INCH**—We have decided to add to our 1899 line Model "G," fitted with 30-inch wheels. To properly bring out the advantages of the large wheel, much care and skill must be exercised, so that the new features of construction will be correctly cared for. The wheel base of Model "G" is such as will correctly balance the increased size of wheel. No sacrifice of strength or speed has been made. It is an all-round bicycle for all kinds of riders. The price is \$60.00.

**CHAINLESS**—In Model "E" we again offer a bevel-gear wheel, which not only embraces the same well-tried principles of the last year WHITE chainless, but which has in addition all of the small improvements which a year's usage would suggest. Outside of the running gear, the chainless for '99 has advanced in merit over that of '98 to the same extent and in the same manner as our chain models have been improved over those of last season. In nothing have we stood still. Price, \$75.00.

Our Ladies' Chainless is a companion wheel to Model "E." It found great favor during '98 among lady riders, because it offered complete protection against muddy riding habits and torn gowns. The woman cyclist is not naturally a mechanic. Our chainless bicycle Model "F," with all the graces and charms of the regular ladies' wheel, comes nearest to being the PERFECT mount for the fair cyclist. Price, \$75.00.

**SPECIAL RACER**—We offer our Racer for '99 as a wheel which is not only built for its intended purpose, but which is built for that purpose with a knowledge gained from three seasons of widespread use on the track. We have endeavored to produce a bicycle which will gain hundreds of new friends among the racing men, because of its absolute worth. The high-grade material, careful, painstaking workmanship, intelligent design and correct equipment of our "Special Racer" are the foundations upon which its prestige on the track rests. We have given special attention to the two most important parts of a racing wheel—the frame and the running gear. Price, \$65.00.

In addition to the above, we build our regular road chain wheels, Model "A" for men, and Model "B" for ladies; price, \$50.00. Our catalogue contains much that will interest dealer and rider.

**WHITE SEWING MACHINE COMPANY,**  
Cleveland, Ohio.

BRANCHES:  
New York, Boston, San Francisco, London, Paris.

# THE PASTIME AND SPORT

## RACING IN FULL SWING

Australian Sport Begins in Melbourne, Sydney and St. Kilda With Big Fleets—The Events.

The racing season was opened in Melbourne November 9 with the meet organized by the Hibernian Society. The principal events were a five-mile scratch race, won by Walne from Barker, with L. M. Jackson third, and a ten-mile scratch race, won by Jackson from Walne, with Jack Parsons third. Parsons looked the winner when they entered the straight, but Jackson came with a terrific rush and won by a length. The two-mile handicap for \$175 was won by L. M. Jackson from 90 yards. Following are the summaries:

Five-mile scratch—Walne, first; Barker, second; L. M. Jackson, third. Time, 13:05.  
Ten-mile scratch—Jackson, first; Walne, second; Jack Parsons, third. Time, 24:45 2-5.  
Two-mile handicap—Jackson, 90 yards, first; A. J. Berry, 150 yards, second; R. W. Lewis, 110 yards, third. Time, 4:42.

A two-days meeting was held at St. Kilda on November 12 and 19 and attracted about 8,000 people each day. The feature of the two days' racing was a paced tournament over three miles, in which eight of Australia's best riders took part. In the first heat Jack Parsons and Larry Corbett met. Corbett, with a low gear against a strong wind down the straight, had the best of the deal, and beat Parsons by a length. In the second heat Walne met Jackson and defeated him by half a length. Lou Barker and Ken Lewis met in the third heat. Barker jumped Lewis, who gave up, letting Barker win as he liked. Beauchamp (holder of all Australian records from 30 to 100 miles) defeated A. A. Middleton in the fourth heat, winning by two lengths. In the semi-finals, Walne beat Corbett by inches and Beauchamp beat Barker comfortably. In the final Walne beat Beauchamp by a length.

The ten-mile scratch was also won by Walne. Parsons fell. The St. Kilda Wheel race was won by the veteran, G. R. Broadbent, from the 140-yard mark. The five-mile scratch was won by Beauchamp from Barker, with Jack Parsons third. Walne, Payne and Porta hung back and were dropped. The first-class handicap of one and one-half miles was won by Walne from scratch. The summaries follow:

Three-mile match heats—First heat: Corbett, first; Parsons, second. Time, 6:47 4-5. Second heat: Walne, first; Jackson, second. Time, 6:31 1-5. Third heat: Lou Barker, first; Ken Lewis, second. Time, 6:31 2-5. Fourth heat: Beauchamp, first; Middleton, second. Time, 6:08 3/4. First semi-final: Walne, first; Corbett, second. Time, 6:46 3-5. Second semi-final: Beauchamp, first; Barker, second. Time, 6:40 3-5. Final: Walne, first; Beauchamp, second. Time, 6:33 4-5.

Ten-mile scratch—Walne, first; Barker, second; Jackson, third. Time, 24:12 3-5.  
St. Kilda Wheel race—Broadbent, 140 yards, first; McKibbin, 250 yards, second; Stewart, 190 yards, third. Time, 4:29 4-5.

Five-mile scratch—Beauchamp, first; Barker, second; Parsons, third. Time, 11:47 3-5.  
One-and-a-half mile handicap—Walne, scratch, first; Barker, 30 yards, second; Walker, 50 yards, third. Time, 3:22.

The racing season in New South Wales was opened on November 12 and 19. Megson rode very poorly the first day but on the second day he rode in something like his old form, winning the five-mile scratch from Hunt, with Forbes third, and beating Forbes comfortably in a mile match in 2:01 4-5. The summaries:

One-mile scratch—A. C. Forbes, first; Miller, second; Elliott, third. Time, 3:30 2-5.  
Two-mile handicap—F. Hunt, 45 yards, first.

Three-mile multicycle handicap—Campbell and Rennie, 230 yards, first. Time, 6:36.

One-and-a-half-mile handicap—J. Crowell, 75 yards, first; G. Campbell, 85 yards, second; J. Cochrane, 65 yards, third. Time, 3:23 1-5.

Five-mile scratch—Megson, first; Hunt, second; Forbes, third. Time, 12:51 3-5.

One-mile match—Megson, first; Forbes, second. Time, 2:01 4-5.

Half-mile flying stakes—Cohen, 55 yards, first; Cuthbertson, 50 yards, second; Gahagan, 55 yards, third. Time, 1:03 4-5.

One-mile November stakes—Forbes, scratch, first; Hunt, scratch, second; Miller, 5 yards, third; Megson, 10 yards, fourth. Time, 2:14 3-5.

Three-mile multicycle handicap—Cliffe, Grear, and Tucker, 160 yards, first. Time, 5:58 1-5.

## Keenan Opposition Not Feared.

Philadelphia, Dec. 19.—Local League lights are in nowise concerned over the numerous reports from Baltimore and New York anent a combination to down Keenan for the next presidency. Conway Sams, of Maryland, would have extreme difficulty in carrying the election in view of his close connection with the present administration. Kireker, of New Jersey, who is also mentioned as a possible candidate for the presidency, is handicapped by the fact that Tattersall, the present treasurer of the League, who is booked for another year, is also from the mosquito state, and is pulling like a dray-horse for Keenan. In the meantime, those who are engineering the Keenan boom are doing some effective missionary work among the representatives of the smaller eastern and some of the western divisions, and by next February it is expected that everything will be cut-and-dried for a stam-pede to the popular Pittsburgher.

## Banker Loses Three-Cornered Match.

The winter circuit of southern Europe made its last appearance in France at Toulouse on December 4. The next meet was to be held in Spain. The principal event of the Toulouse meet was the three-cornered match between Banker, Tommaselli and Grogna for \$200. Banker won the first heat of 1,200 meters in 2:04. The Italian started the sprint but slipped on the damp track and was passed by the American. Tommaselli won the second heat by half a length from Banker, with the Belgian third, and the final heat was won in the same order. Banker took the lead in the last quarter mile, but at the beginning of the last lap Tommaselli made a fine jump, passing Banker and gaining two lengths. Banker went after him and closed the gap and in the home stretch the two were neck and neck, but at thirty meters from the tape the American's front wheel slipped on the track and the Italian won by a length, with the Belgian third. Five teams started in the 2,800 meter tandem race. At the bell Banker and Tomasselli sprinted away from the field and passed the tape with a lead of almost fifty meters in 4:15. Pastaire and Leynaud were second.

## New York Dealers Against Racing.

New York City, Dec. 19.—At its annual meeting at Rochester last Thursday the board of officers of the New York State division practically declared against the retention of racing control by the League. There was a hot fight over the retention of a racing board by the state division and at the end of the discussion the vote showed 33 against the retention of the state racing board to eight in favor of it, and a resolution was passed striking the words "racing board" from the constitution and by-laws of the division.

## NEW C. W. A. CANDIDATES

Montreal and Toronto Select Favorites for Presidency and Vice-Presidency.

Toronto, Dec. 12.—Although the annual elections for office in the Canadian Wheelmen's Association do not take place for some time yet, Montreal has already put forth candidates for president and vice-president. Louis Rubenstein, the present vice-president and A. B. Rattray, chief consul of the Montreal district, have been placed in nomination for the presidency and vice-presidency respectively. The Ontario men whose names have been so far mentioned are E. B. Ryckman of this city and Dr. J. D. Balfour of London. Mr. Ryckman is looked upon as the stronger candidate. For the vice-presidency no person has yet been announced from Ontario, although the friends of H. B. Howson, chief consul of the Toronto district, think he is entitled to the honor. It is likely, however, that Mr. Howson will be prevailed upon to take another term as chief consul in preference to the less useful position of vice-president.

On a recent visit to this city, Major General Hutton, the general in command of the Canadian military forces, and his staff, galloped over the cycle path built at great expense by the Toronto wheelmen, causing considerable damage to its surface. The cyclists felt much aggrieved at what they considered a very bad example to teamsters and others. Upon his attention being called to the matter the major general promptly offered to personally defray all expenses for repairs which had been caused by the negligence of his staff.

## Six-Day Race for San Francisco.

A 24-hour race will be run in New York on January 6 and 7. It has not been decided yet whether this will be a paced or unpaced event, but the first prize has been placed at \$1,000. Following this Brady and Kennedy will go to San Francisco, where Alfred Ellinghaus is promoting a six-day grind to begin February 6, the prizes being \$2,000, \$1,200, \$750, \$500, \$300, \$200 and \$100. Waller, Pierce, Albert, Schinneer, Stephane, Frederick, Gimm, Schock and Nawn have decided to enter this and will accompany Brady and Kennedy west, leaving New York on January 8 or 9. Miller wants to take part in both contests, but his employers will not consent, as they think the strain would be too great even on Miller's constitution.

## Sturmey Warns the Rebels.

Henry Sturmey, secretary of the International Cyclists' Association, writing to a friend in the United States relative to the position of the I. C. A. toward the racing men suspended by the L. A. W. for riding at unsanctioned meets, warns the seceders as follows:

"In view of the revolt of racing men against the League of American Wheelmen, it appears that there is a certain amount of misconception as to the position of things on this side, which it may be well to clear up at once. I notice that Arthur Gardiner of Chicago, one of the League of American Wheelmen's suspended riders, is proposing to visit Europe, and has stated that the racing men abroad are with the dissentient American riders and that all European tracks will be open to them. In case others may be similarly misinformed, I think it well to point out at once that with the sole exception of Spain and Portugal, Russia and the Eastern European countries, where there are no unions, and practically no rac-

Mention The Cycle Age

Good Company is desirable.  
 Doubt you think the "Morrow-Coaster & brake will be in the swim"? It will be fitted to Barnes, Dayton, Stearns, Pierce, Spaulding, Ivers Johnson, Acme, White, Orient, Reading-Standard, Thomas, Wolff American, Columbus, Eclipse and other makes of wheels for 99. If you want a money maker order your wheel fitted with the Morrow Coaster & brake

ing, every union in Europe is affiliated with the International Cyclists' Association, and all are unanimous in upholding the suspensions and decisions of any of their bodies, so that if these men are suspended upon reasonable grounds by the League of American Wheelmen—an affiliated body—they can take it from me as a positive fact that that suspension will be upheld and that a journey to Europe would be a useless one; for they certainly would not be permitted to ride by any of the European organizations. I write this to save any unnecessary journey."

### WHEELMEN AS PREACHERS

Striving Earnestly to Convert Their Countrymen to a New Faith—Would Relieve Their Burden.

It can be truthfully said that during the very brief period that there has been concerted action to secure an improvement in the road system of this country, a great deal has been accomplished. The wheelmen of this country have been among the most active workers in this cause. There is no need to preach good roads to the wheelmen. Every wheelman is a preacher, a worker and a fighter for good roads, and has spread the propaganda throughout every city and village in the United States. Since the wheelmen have been agitating the question of good roads they have aroused an active interest in this subject among the farmers of the country, to whom the question of good roads is of the highest importance.

The farmers have great reason for taking up this question and one which many of them never thought of. It is due to them, in absolute justice, that the whole business of road construction should be remodeled. Farmers lose by not being able to get to market when the market is good, by the waste of products that can not be marketed at all on account of bad roads, by not being encouraged to cultivate things that require a speedy market, and in a great many other ways. The actual money loss to the farmers of the United States by the bad roads of the country is not less than one-fourth of the total home value of all their products. The total home value of the annual products of the United States farms is about \$2,500,000,000, and the loss by bad roads is about \$600,000,000, so that the farmers lose, or they would lose if they could stand all that loss themselves, one-fourth the value of all their products by the extra cost of getting them to market. These figures are startling and should awaken the agricultural element of the country to a realization of the value of a good road system. It is indeed time the whole country was waking up to the importance of the question.

### FAVORS WHEELMEN'S DEMANDS

Governor Elect of Kansas's Cyclist—Will Push Good Roads and Bicycle Baggage Bills.

Topeka, Dec. 19.—The wheelmen of Kansas have much confidence in the newly-elected governor of this state, Mr. Stanley, who is a bicyclist, and rides between his home and law office in Wichita daily. His wife and two children also ride bicycles and all are enthusiastic upon the subject.

During the session of the legislature two years ago the bicycle baggage bill, and another providing for the employment of convict labor on the public roads failed to pass, and wheelmen are solicitous of the outlook for the coming year. When asked by a representative of Cycle Age regarding his attitude toward these subjects, the governor elect replied:

"I am heartily in favor of giving the wheelmen anything they want within the bounds of reason. Don't understand now that I mean that they are likely to ask anything unreasonable, for I believe that the wheelmen are a satisfied, aggressive,

first class element of American citizenship, and the things which they have been advocating for years meet with my entire approval. I shall recommend to the legislature in my message, legislation in the interests of the whole people, viz.: for good roads. I have not yet determined what I will suggest, but I am convinced that something should be done in this direction. This is a subject to which I think too much importance cannot be attached. We have convict labor, which under the present system of management in many states amounts almost to nothing, and if some man can devise a plan whereby this idle labor can be employed without coming in competition with free labor, he deserves the greatest honor as a public benefactor." Mr. Stanley will undoubtedly also recommend the adoption of the bill requiring railroads to carry bicycles free.

### French Cyclists and Tax Tags.

Cyclists in France are not only taxed, but are obliged to carry a plate on their machines bearing the owner's name and address. In order to prevent people avoiding payment of the annual cycle tax the government is about to introduce another plate which cyclists will also have to attach to their machines. This plate will be issued annually when the tax is paid and will constitute a receipt for the same, which will free the owner from molestation. But woe betide those cyclists who do not pay their tax, and whose machines do not bear the outward and visible sign of such payment. They will be subjected to many pains and penalties. In accordance with the decision of the Council of State the manufacture of said metal plates or labels is about to be put to contract. The number of "plaques" to be made for the year 1899 will be 634,000.

### Jacquelin the Favorite in Moscow.

A big race meet was held in Moscow on December 3 and 4. An international event at one and a half versts was run in five heats, three semi-finals and a final. Boutilkine won the first semi-final from Singrossi, Jacquelin took the second from Zarn, and Outotchkin won the third from Dei. In the final Boutilkine led throughout until Jacquelin started his sprint and won by half a length, the Russian running a close second. On the second day was run a three-versts race for the prize of Moscow. Jacquelin, Singrossi and Boutilkine qualified in the three semi-finals. Jacquelin won his heat and semi-final in such fine style that he was the favorite, but in the final Singrossi and the Russian ran him to the pole, the former winning with Boutilkine second. The act was greatly hissed by the spectators.

### NEWS IN BRIEF.

Willy Arend has opened a tobacconist's store in Berlin.

Otto Ziegler, Jr., contemplates racing in Paris in 1900 during the international exposition.

Charles Miller is filling a three weeks' engagement to ride the home trainer in a New York theater.

Parlby will race at Moscow in company with Bourillon, Jacquelin and Singrossi on December 24, 25 and 26.

Five days of 24-hour, middle-distance and sprint racing, extending through two weeks, have been arranged for Madison Square Garden by the American Cycle Racing Association.

A novel contest between motorcycles and human pacing is to be held at Madison Square Garden next Saturday night. Jay Eaton and Teddy Goodman are to follow two of Fournier's petroleum tandems, changing pace as often as they desire, and Harry Elkes is to have the best teams of pacing men he can get together on triplets

and tandems. Fournier thinks he can go the full twenty miles under a two-minute gait.

Joyeux sailed for home last Saturday and Edouard Taylore started yesterday for a visit to Paris, to return in the spring.

A. A. Chase has just won a 100-mile road match for \$875 from W. H. Hands, who had a handicap of 7:30 and led for the first thirty miles.

Arrangements are being made for the construction of a quarter-mile board bicycle track in Augusta, Ga., for next season's racing.

Bald is reported to be training in West Baden Springs for a match race with Tom Butler at Madison Square Garden on New Year's eve.

The manager of the Prince track in Paris announces that the next 72-hour race will be held May 19 to 21, the event to be made an annual affair.

Michael, McDuffie, Elkes and Taylore have been selected to compete for the indoor middle distance championship at Madison Square Garden early in January.

Waller, who won second place in the six-day grind, rode a bevel-gear chainless during the second half of the contest, having borrowed the one that McDuffie was riding when he fell in his exhibition ride.

Sentimen in St. Louis seems to be against the proposed 142-hour race which Brady and Kennedy are trying to promote for that city, and the health commissioner and leading physicians will protest to the authorities to prevent it taking place.

At the Ohio Centennial, to be held in Toledo in 1902, one week will be devoted to the cyclists of the land. The local cycle board has persuaded the centennial commissioners that such a week would be appreciated and a grand carnival will be arranged.

The growing lack of interest taken by manufacturers in racing matters is shown by the difficulty the contestants in the six-day race had in securing retainers. Even Miller could not induce any maker to pay him for riding his tires and the victor therefore rode a pair of French tires which he brought back with him from Europe.

Recalling the great Milwaukee boom that was launched at Indianapolis during the last League meet, the beer city seems to be preserving a most remarkable silence just now when Boston and Buffalo are pulling so hard for the meet next summer, which is to be located by mail vote of the executive committee of the League next month.

Pierce, who finished third in the 142-hour race, is a poor Canadian whose wife is so ill that the doctors say she can be kept alive only by a trip to the west, and it was in the hope of winning a sufficient sum from the race that he entered, for he is himself opposed to six-day racing, but manfully said before the start he would be willing to ride to death if he knew by so doing his wife could have her health restored.

Springfield, Mass., Dec. 19.—The wheelmen of western Massachusetts will endeavor to secure, through the assistance of the state division of the L. A. W., the passage of a law providing for the taxing of bicycles in the western counties of the state to secure funds to build cycle paths. It is proposed to have cycle path commissioners in the different counties who will have absolute control of the paths. Doubt has been expressed as to the constitutionality of the proposed law and if it should be rejected on this account an effort will be made to secure funds by some other means. The cycle path advocates will introduce into the legislature this winter an amendment to the present law to provide for punishment for malicious injury to cycle paths.

The National Cyclists Union of England has completed its first twenty years of existence, having been formed in 1873 as the Bicycle Union. In years past there was much friction between the racing cyclists and the ruling body, caused primarily by tactlessness, the needless cause of the present split between the L. A. W. and the racing men in this country. Within the last five years the N. C. U. has undertaken the management of professional cycle racing, and as a consequence there has been a development of this branch of the sport. For two or three seasons past the N. C. U. has agitated for "universal lighting." It has not hitherto been possible to secure a general enactment covering the whole of England; but the reform is being gained piecemeal. Nearly thirty country councils of England and Wales having adopted a by-law as suggested.

## DID YOU EVER NOTICE

how a snowball grows in size as it rolls along? It's all simple enough—nothing but holding fast at each revolution to what the last revolution attached.

Precisely so in business—old customers must stick if the business ball is to grow. What makes them stick? A good many things, but the foundation is always the same—sound, reliable goods—goods that keep your promises—goods that work and wear.

**League Tires are business-holders**—light, lively, lasting. From tube to tread everything is first class—not an ounce of dull, heavy rubber, not an inch of cheap, short fibre fabric. Every "Get there and get back" tire is a running advertisement for some one—why not for you? Call or write.

### LEAGUEKIT

is a thoroughly practical repair tool. Plug goes in easily, without plyers, small end first. Pulls back into place with string Can't fall into tire. Makes either plug repair or cement repair. Write for prices.

**UNION CYCLE MFG. CO., - Highlandville, Mass.**

Most of the newspapers of the country having had their hysterics over the alleged brutality of the last six-day race, it is interesting to read the comment of the New York Sun at the close of the event. Editorially it says: "The contestants were not cripples and maniacs when they left the Garden. On the contrary, they were constitutionally uninjured, and one and all seemed satisfied with the result."

The suggestions of the wheelmen of New York for the building of a special path for cyclists on the Brooklyn bridge has been pronounced unfeasible by the chief engineer of that structure, who says that it would add too much extra weight and that suitable approaches could not be constructed.

The committee in charge of the preparations for the international race meet to be held in Montreal next summer propose to raise a purse of \$2,000 or \$3,000 as a prize in a contest between the Orient, Dunlop and some German pacing team if these can be brought together.

Conway Sams, chief consul of the Maryland division L. A. W., and, it is said, aspirant for League presidential honors, has drawn up plans for the establishment of central headquarters for Baltimore members of the L. A. W., to be used as a club house.

Khyber Pass has become a Sunday resort for the cyclists of Peshawur, India, who start up the mountains Saturday and return Monday. The roads are excellent, but great care has to be observed to avoid collision with camels and their drivers.

Fred Titus is at present singing in the chorus of the "Belle of New York" in Chicago, being content to start at the bottom in a new profession and work toward the top, rather than to emulate "our Eddie."

The cycling editor of the Syracuse Standard takes the following optimistic view of the outlook for racing next season: "Makers are quietly arranging for teams, meet promoters are already arranging the programme for another season, the cycle riders feel certain of success in their efforts to divorce racing from the League, and the track owners generally are falling in line for the formation of a controlling organization. The sport of '99 will be of the best character and will tend more towards the sprinting nature than during the present season in all probability. Pacemaking teams will be supplanted by motor-cycle pacing to remove expense and first class instead of second class foreigners will come to America for sprint racing."

The youngest prince of the royal family of Sweden is a very ardent cyclist. He is often seen taking long trips out into the country, sometimes traveling incognito. He is also fond of riding centuries.

Walter Sanger—"Wooden Shoes" of un-paced fame—has permanently retired from racing and is now interested in the manufacture of handlebars in Milwaukee.

## AND TRADE REVIEW

VOL. XXII—No 9.

CHICAGO, DECEMBER 29, 1898.

NEW SERIES No. 58.

### ACID CLEANED FRAMES BARRED

#### UNION TO WITHHOLD ITS LABEL

**International Organization of Bicycle Workers May Make Serious Trouble for Chicago Factories.**

The leading man of the International Union of Bicycle Workers has announced his intention of compelling the factories in Chicago to use the union label. If the factories will not come to time in this respect he will drop persuasion and employ force. He says:

"Toledo bicycle manufacturers long ago recognized the value of the union label, and that is the best organized city in the United States. While manufacturers in other cities, and especially in Chicago, are running short-handed and are afraid of the future, in Toledo they are running night and day, and we claim it is because the union label is placed upon all bicycles made there. Many bicycles are now made in penal institutions, and organized labor is agitating for a law forcing all such products to be labeled 'convict made.' This will help the manufacturer who employs free labor, and should be an argument why he will be benefited if he permits his workmen to organize. We will not permit the use of our label on wheels polished with acids, as we do not care to take such responsibility. Several of Chicago's big factories use this system, but when the public discovers the fact bicycles made by them will be boycotted very effectually."

#### No Label for Acid Cleaned Frames.

Presumably the allusion to the use of acid is intended to have special reference to frame cleaning. There is no acid used in polishing. Frames get greasy from handling in the fitting and brazing rooms, and are dipped in a mild solution of sulphuric acid and then plunged into an alkaline solution which neutralizes the acid, saponifies the grease and permits its easy removal. The process is common, but is not injurious.

#### Pamphlet on New Shop Methods.

It is further announced that arrangements are also being made to publish a pamphlet containing a full account of the new methods that have been introduced in bicycle factories in order to cheapen the cost of the products. In the sight of the union it seems to be a crime of the first magnitude to cheapen cost of construction.

#### Holiday Trade Was Brisk.

Philadelphia, Dec. 27.—The retail holiday trade of the present season, from the point of view of the local cycle tradesman, has been decidedly encouraging as compared with that of last season.. Busi-

ness during the week preceding the great Christmas holiday was so brisk on "the row" as to make it necessary for most of the principal establishments and many of the smaller ones to keep open evenings. The fact that the majority of the cycle houses on Arch street carry side-lines of goods which are in most cases suitable for gifts appropriate to the season naturally had much to do with this welcome, if short-lived, boom, the profits whereof will go a long way toward tiding the dealers over the dreaded "between seasons" which is not due to terminate until about March 1.

#### Proposed Taxation of Bicycle Business.

In a revision of the state revenue laws of Georgia a bill has been brought before the legislature wherein a tax of \$200 is imposed on every company selling or dealing in bicycles, by itself or its agents, in that state, and all wholesale and retail dealers in bicycles manufactured by companies that have not paid the tax. The company or dealers are required to furnish the controller general a list of agents authorized to sell bicycles of their manufacture, or under their control, and must pay the controller \$5 for each agent for the fiscal year, or fractional part thereof, for each county in which the agent does business for the company. The result of such a law in that state would, according to an objector to the proposed restrictions, be that two-thirds of the dealers would be forced out of business. Citing Columbus as an example, he says that two of the prominent dealers would move their business to the adjoining Alabama towns, thereby avoiding the tax and still, no doubt, sell bicycles in Columbus.

#### Death Caused Change of Plans.

In confirmation of the rumor that the Elgin Sewing Machine & Bicycle Co., of Elgin, Ill., was preparing to go into the manufacture of motor vehicles, the company states that such was its intention, but owing to the death of Assignee Dewitt Campbell a fortnight ago, the plans have been changed. The Chicago Title & Trust Co. is assignee now and the plant and machinery are to be sold.

### NO POOL AMONG TIRE MAKERS

#### RUMORED COMBINATION DENIED

**From the East Comes the Statement that a \$30,000,000 Company is Being Formed.**

Tire makers laugh when asked to speak to the theme of the reported combination among the leading houses. The daily newspapers have it that the B. F. Goodrich Company, Morgan & Wright, the Hartford Rubber Works and the New York Belting and Packing Company are to pool issues, form a company with a capital stock of \$30,000,000, half of which is to be 7 per cent. preferred stock and the remainder common stock. It is also alleged to be part of the plan to smother competition in the manufacture of hard rubber goods, and to this end some other concerns are said to have been invited to join the combination.

#### Flint's Little Scheme.

As if this were not enough, the sensation mongers add:

Of perhaps greater importance than the organization of this new trust is the fact, which became known to-day, that it is the intention to make an alliance with the old rubber trust for the purpose of getting control of the crude trade. To effect this they will send representatives to the rubber districts and possibly buy up certain territory. If this can be done they believe it will be possible to dictate the price and market requirements and virtually control the trade. It is said the factories embraced in the two combinations use the greater part of the rubber output of the world, and will be in a position to say much about prices. The principal work in organizing the new trust, which is expected to be placed on its feet in two weeks, is being done by Charles R. Flint, who organized the United States Rubber Company.

#### What the Tire Makers Say.

The reply of Morgan & Wright to these assertions is not flattering to the hopes entertained by Flint or his credulous dupes. This firm says:

It is an old story. It has been brought out so many times that it is becoming tiresome. Our firm will not join any trust or combination. We suspect that this late version of Mr. Flint's project has been given to the press for the purpose of ascertaining how it would be received. There are a few hard rubber goods makers in Trenton who have pooled issues and aspire to get larger firms to join them. So far as our tire business is concerned we shall remain independent to the end.

#### Fake Pure and Simple.

Our name appears in the list of companies forming the proposed combination without any authority from us. It was purely gratuitous, probably upon the part of some enterprising newspaper man who either did not take pains to get the facts or was misinformed. THE B. F. GOODRICH CO.

#### Sieg Strike Settled.

The strike of the employes of the Sieg factory in Kenosha, Wis., was settled last

Saturday through the assistance of the state board of arbitration. On Tuesday more than 100 of the strikers resumed work at their former wages, notwithstanding the statement of the previous management that while it had no desire to cut the men below living wages, it could not afford under existing conditions to pay according to the former scale when there were plenty of men willing to work for what the company could offer. The difficulty between the men and the management arose two weeks ago apparently from a change of superintendents, the new factory manager having without notification cut the wages of some of the men who had previously accepted a slight cut. Screw machine hands demanded \$1.50 per day. The polishers, who were cut to \$2 and \$1.75 per day, asked the regular union scale rate of \$2.50. All but two or three of the men went out on strike.

### IS FORCED TO PAY

**Loop Hole in Bicycle Protective Policy Unavailing—Insurance Methods Annoy Makers.**

Lyman D. Wood, of Columbus, O., secured a verdict of \$52 against the Toledo Bicycle Protective Company on December 16 in a suit brought to recover the value of a bicycle which he had insured with the company and which had been stolen. The company claimed that according to the contract it could not be held responsible for the loss, since the owner had been careless in leaving it in front of a business house for several hours. The jury, however, brought in a verdict in favor of the plaintiff as above, the amount representing the \$34.50, the cost of the bicycle, \$16 for the rental of a substitute machine for eight weeks at \$2 per week, caused by the failure of the protective company to make good the loss, and \$1.50 as interest on the principal.

A feature of the bicycle "insurance" business that has escaped most riders who have taken out contracts or policies and has caused considerable annoyance to the trade, is the fact that instead of insuring the owner for the full cost of his machine, the company agrees only to replace the bicycle with another of the same make or one "of equal value." The managers of these companies approach the manufacturers and demand agents' prices on such machines as are purchased by them to replace those stolen from the persons insured with them, thus inducing price cutting and at the same time getting a much higher premium rate than appears on the face of the contract.

### Keim Suffers for Electric Lamp Co.

A Supreme Court jury returned a verdict recently of \$1,144.17 against John R. Keim of New York city in an action brought by the Union Bank of Buffalo. The suit was instituted to recover the amount of a promissory note made by the Eclipse Electric Lamp company, now defunct, of which Mr. Keim was a director. The bank discounted the note and under the law Mr. Keim was held as one of the board of directors. The suit has been on the different court calendars for some months, Mr. Keim's counsel says, and it is his belief that Mr. Keim was singled out as the only one of the stockholders who had any money. It is generally believed that Mr. Keim's recent purchase of the Spaulding plant was the cause of the suit being brought against him. The Eclipse Electric Lamp company was organized a year or more ago and worked in connection with the Spaulding Machine Screw company, in the manufacture of bicycle lamps.

## DISCUSSING AMERICAN GOODS

### EXCLUDED FROM PARIS SHOW

#### Spirited Comparison of Merits of Our Bicycles With Those of Home Manufacture in France.

A war of words is going on in Paris through the French cycling papers as to the comparative merits of French and English bicycles against the American machines. Those taking part in the interesting discussion are a firm of leading French manufacturers, upholding the French goods, a French agency firm representing four prominent United States manufacturers, advocating the superiority of the American product, a well known American exporting house having branches in Paris and elsewhere advocating the priority of American inventions, and a French firm taking the part of arbitrators.

#### American Agents Wanted More Space.

The long-drawn-out fight grew out of the fact that the Chambre Syndicale des Fabricants de Velocipedes, corresponding to the Board of Trade of Cycle Manufacturers in this country, of which the first mentioned party above is a member, granted only two exhibition spaces in the Salon du Cycle to the second party, who had applied for four stands. The American representatives complained that this was unjust, as they represented four American makes, whereas French makers of but one line were awarded two or three stands—a fact that plainly showed the French makers feared the competition of the Americans.

Replying to this, the first party stated that the great imports of bicycles from the United States were due only to the uninterrupted overproduction here, and that French makers of first-class machines had no reason for alarm, since the mechanism of the American bicycles is so complicated and delicate that no cyclist or tourist yet born can learn to clean, adjust and keep them in order, and that an American machine once broken on French soil cannot be repaired. It was also maintained that the American parts and fittings, for these reasons, cannot contribute to establish any permanent changes in construction. "France is not Cuba," he writes, "and one cannot take it a l'American," as the English learned after flooding France with their machines, which have had to recross the channel, France having produced bicycles equally good and cheap. "So," he says, "it will be with the American machines, and within eighteen months they may pack up and go."

#### Favors Using Automatic Machinery.

The arbitrating party entered the discussion at this point with the following well put statement: "We recognize the superiority of the American machinery for the making of bicycles, and those of our countrymen who have purchased and are using such machines are acting wisely, because buying American machines to make French bicycles is like buying the guns that will throw bullets to stop an invasion, but to buy American bicycles is like getting American bullets from American guns; therefore, let us buy American machinery but not American bicycles, because, having then the same material and facilities, we can ourselves manufacture equally good bicycles." In this statement the concession of the superiority of the finished product of our own makers is obvious.

Following this a French firm, through a large advertisement in the paper, asserted that it had already sold 20,000 bicycles in one week for the coming season, but that American bicycles were selling as five to

every one of English or French manufacture.

Either because piqued by the discussion it had called forth or because the alarm of its members had been increased by the facts the discussion had brought out, the French manufacturers' association at its last meeting decided not to allow the firm of American representatives to have any space at all in the Salon du Cycle instead of the two spaces to which it had taken exception.

The American agents, who had gone to considerable expense in advertising the exhibits they expected to make at the show, promptly instituted suit for damages against the Chambre Syndicale.

### Humber Affairs in America.

An investigation of affairs at the Humber factory in Westboro, Mass., has been made by a representative of the English stockholders. He was armed with a power of attorney which gave him authority for a searching examination of the books and plant. In his work he was assisted by an English machinery expert. Both have returned to England for the purpose of submitting their joint report to the directors of the parent concern. While not anticipating the action which may follow the reading of this report, it is entirely proper to state that the condition of affairs is so far from hopeless that it may almost be stated as a certainty that business will be resumed. In the event that the English stockholders should decline there are Westboro men of means and experience who stand ready, in fact pledged, to make a reasonable offer for the plant and good will of the concern.

### Raleigh and Gazelle Companies Combine.

The troubles of the Raleigh Cycle company of England are now stated to be nearing a settlement. It is believed that the appointment of the receiver might have been avoided but for a desire to effect certain changes which during the life of contracts still existing was impossible. Mr. Bassett has resigned his position and Frank Bowden, whose retirement from office two years ago was due to ill-health caused by overwork, has assumed the management and a scheme of reorganization has been definitely settled upon. The Raleigh and Gazelle interests are to be consolidated and worked by means of capital raised by an assessment of 2s 6d per share.

### Public Interested in an Ice Bicycle.

Considerable interest has been created in eastern Wisconsin by the inventor of an ice bicycle who has been making trials of his runner-shod vehicle on the Milwaukee river and the lakes about Oconomowoc. There is apparently nothing new about the invention, however, which consists in substituting for the usual rear wheel of a bicycle a wheel having twelve ice dogs attached to the steel rim and fastening a runner in a steel frame at each side of this driving wheel. A sharp runner is also clamped to the rim of the front wheel, which must of course be made stationary, and steering is effected with the usual handle bars.

### Dreher Suffers the Penalty.

Toledo, Dec. 26.—Frank Dreher pleaded guilty to using the mails in pursuance of a scheme to defraud, and Judge Hicks fined him \$250. Dreher is the man who offered "high grade bicycles for \$3.90 each."

The seventh annual bicycle and automobile show was opened in Paris on December 15 by the French minister of commerce.

**DECREASING INTEREST RATES  
NOT DUE TO SLUGGISH TRADE**

**Permanence of Low Rate is Doubted by  
Financiers—Encouragement  
to Thrift.**

The opinion has been expressed in high financial circles that the present low rate of interest is not likely to be permanent, with an implication that it is desirable that it should not. The decreasing rate of interest, however, bears so close a relation to normal economic development that there will be some hesitation about regarding the present rates as the result of temporary causes.

**Business Exceptionally Active.**

A low rate of interest might be due to a lack of demand, but in most cases the lack of demand is due to a depressed condition of business which is likely to keep capital out of the money market. It cannot be said at the present time that business is sluggish. The bank clearings, the railroad earnings, the production of iron and steel—these are merely a few of the indications of an exceptionally active state of business. There must be a full normal demand for capital. A much more usual cause of low rates of interest is the amount of capital in the money market. With the growth of wealth in the world there is a decrease in the earning power of money. That interest is lower in London and New York than in remote communities where little capital has yet been accumulated is a sufficiently familiar illustration of this tendency of interest to go down as the volume of capital goes up. Capital has been increasing rapidly in this country, the rate of interest has been going down, and the present movement does not seem to be abnormal nor exceptional.

**Observation Proves the Contrary.**

There have been fears that a low rate of interest would discourage saving, and prove inimical to the accumulation of capital. This is one of those a priori propositions that do not bear very close examination or a comparison with facts. It would be quite as logical to say that a low rate of interest promoted saving, because a man would need twice as much capital at 3 per cent as he would at 6 to provide him with a given income. A comparison of saving habits of former times with those of the present, or those in countries where interest is high with those in countries of low interest, will not sustain the idea that the saving habit declines with the rate of interest. Thrift is most apparent where the rate of interest is low.

**The English Cycle Agent's Condition.**

On an average the English agent handling medium priced machines, listing between \$55 and \$62.50, has only about \$7.50 gross profit on every sale. His maker does not supply a toolbag, nor tools; just a tire inflater that is no better than a syringe, as he mournfully complains. He pays for the crates in which his machines are shipped—50 cents apiece—and for transportation charges about 85 cents. He gives customers a better saddle than is fitted at the factory, exchanges the handle-bar when asked to do so, makes a present of spanner and lamp—and is hounded by traveling men till he attends the shows. The picture is drawn by one of him.

**Charges Fraudulent Transfer of Stock.**

A petition in equity has been filed in the district court in Des Moines, Ia., against E. D. Kenyon et al. by the Sterling Cycle Works, which alleges that on October 5, 1898, a judgment was rendered

in the district court in its favor against these defendants for \$112.83; that the plaintiff has caused the issuance of two writs of execution against the defendants, and that each was returned unsatisfied. It is now claimed that the stock of the Kenyon Bicycle company, consisting of thirty shares at \$100 each, has been transferred to Elvira Kenyon, S. J. Beans, W. C. Beans and A. S. Kenyon, and that such transfers were fraudulent and for the purpose of hindering and with the intent to delay and defraud creditors, particularly this company. The Sterling company asks to have the conveyances decreed fraudulent, and that the title to said stock be decreed and established in the defendants in order that the plaintiff may levy upon the same for the purpose of realizing its claim.

**CHAPMAN CONTROLS COLUMBUS CO.**

**Horace L. Outbids a Stranger Who Offers \$9,600—  
Benjamin Chapman May Return.**

Horace L. Chapman has purchased a controlling interest in the Columbus Bicycle company. In all likelihood, therefore, his son Benjamin, who has been so long and conspicuously identified with this concern, will again re-enter the field from which he recently withdrew.

Mr. Chapman bought the stock owned by John A. Pfeifer, who assigned some time ago, paying for the same \$9,650. The stock was sold to James Ross, the assignee, and was bought in by Mr. Chapman, after some very lively bidding.

The first bid was \$6,000, this being made by Mr. Chapman. After some little time a stranger bid \$6,500. Mr. Chapman bid \$7,000, at which the stranger went him \$500 better. Mr. George Urlin made a bid of \$8,500 after Mr. Chapman had raised his bid to \$8,000. Again a halt was made, but after a few calls Mr. Chapman bid \$9,000. The sum of \$9,200 said the stranger. Then \$9,300 was bid by Mr. Chapman. \$9,400 said the stranger. "I will bid \$9,500," shouted Mr. Chapman. Another wait and then the stranger bid \$9,600. Mr. Chapman only raised this bid \$50, but it was enough, and the stock was sold to him.

The value of the 52 shares of \$100 stock has been placed at various figures. The stock was appraised at \$22,500. The company is capitalized for \$31,200, but the last appraisement amounted to \$111,506.54.

**Building Motor Vehicles in Mexico.**

According to an ex-Chicagoan who has a flourishing business in the City of Mexico but is now on a visit to his native city, motor vehicles are being manufactured on a commercial scale in Mexico, where great interest is being taken in mechanical propulsion of carriages. "One firm," he says, "turns out from fifty to sixty a year, retailing them at \$500 to \$700 each. Gasoline is used as the motive power. The demand for motor vehicles is good and I look for a thriving business in the new machines."

**Pope Company Sued by Bilgram.**

Hugo Bilgram, the well known bevel gear cutter of Philadelphia, has sued the Pope Mfg. Co. for infringement of his patents issued for a machine for cutting bevel gears.

Work is soon to begin at Newport News on the construction of two steamships with carrying capacity of 11,000 tons each, to be put into service between San Francisco and Hong Kong. These will supplement the service of the Pacific Mail Steamship company and will make an average speed of eighteen knots.

Totals .. ..	\$9,278,020	\$7,155,645	\$4,407,330

**Chainless Bicycles in Demand.**

The bicycle dealers of Pittsburg report having sold many more machines for Christmas gifts this season than ever before at this time of the year in the history of the business. A noteworthy feature of the trade is that the demand for chainless machines exceeded the call for the usual type nearly two to one.

### ALMANACK CYCLE CONSTRUCTION

There are expressions used in trade parlance which are beginning to chafe the industry and diminish the working capacity of salesmen. They sit on the cycle trade like an ill-fitting collar on a true-pulling horse. There is especially one such expression which it is time to replace or remodel. When the load is light it merely worries the faithful animal; but with heavy pulling it makes sores, which are not easily healed.

"Our 1899 models are now ready for inspection!" This has for months been the refrain of business announcements. "Patterns," says the purist, in preference to "models," but "1899" is the unavoidable prefix. "Our models for 1899 trade," "our models for next season," that is, are the variants which indicate impatience at the term, but few indeed are those—mostly matter of fact jobbers—who simply sweep the tradition of compulsory season changes to one side and present their goods to the trade without reference to supposed expectations of phenomenal progress or implied confessions of past mistakes.

Recent catalogues are teeming with apologetic explanations of the reasons why goods offered in the market this fall are essentially similar to those which were offered last fall. It is sometimes made a boast that no change has been found necessary; but through the boast is heard the apology. Evidence is plentiful that the manufacturer thinks the public will expect changes, and that the manufacturer would make them if he could possibly see his way clear to do so. In other words, the manufacturer realizes that a percentage of the public and of the retail trade will still consent to pay something for seasonable novelty, but not so much as to compensate the manufacturer for the trouble of producing it unless something clearly more valuable than novelty alone is involved in the change. What troubles the fidgety manufacturer is the supposed attitude of the public. This attitude may not be exactly as supposed. The supposition is indeed fictitious so far as the better part of patronage is concerned. But whatever there is of the attitude and of the supposition has only one prop—the continued use of the term, "1899 models." It implies an obligation to present a novelty. Behind the back of this term, the impression steals its way into the mind of the purchaser that goods which present no changes of importance are not entitled to the moderate price asked for them.

If the term had been abandoned three years ago the price of bicycles and of accessories and sundries would have been 25 per cent. higher than it is today. The trade would have been 50 per cent. richer. Grant that the term has a small value for retail selling purposes in March, April and May, the shadow of the subsequent year's model—the shadow which coming events cast before them—begins to spread its dark mantle as early as June. In June, July and the rest of the year prices are depressed and sales are retarded by the expectancy of what "1900 models" may be like. During three months the "1899 model" has a lease on fashion with a small minority of the public. During the nine months thereafter, when these models should have a ready sale at maintained prices, the brief illusion is heavily paid for. An irresistible argument against full prices is based upon the tradition of season changes and the term of expression which legitimizes it.

This regularity should be broken. It should be possible to send out "new models" in the fall, or at any other time of the year when conditions require it. This year the prosperity of the rural population which culminated in the late summer and the early fall created a large late demand for bicycles. The profits from it could have been greatly increased if "new models" could have been offered for its satisfaction instead of "1898 models."

Only the absolute abandonment of almanack regularity in bicycle construction and eradication of the public's anticipations in this respect can restore the effectiveness for trade purposes of those changes in construction that the manufacturer sees fit to make, and can relieve him from the need of making changes which are immature or of which he does not clearly perceive the intrinsic advantage. In order to accomplish this end it seems clear that all phraseology should be avoided which perpetuates the undesirable condition.

In their advertising matter manufacturers can do very much to abolish the common season terminology, if they choose. The press can do as much, and the Cycle Age as its share offers the New Year's present to the trade: that it will hereafter—beginning with the next number—completely eradicate from its reading matter all reference to new patterns as being limited to any particular season. There will be no "business policy for 1899," no "prices for 1899," outside of the advertising pages.

So leavened with terms that smack of season talk, season prices and season construction is the trade that considerable vigilance is required to uproot them, but the work can be done, and dealers may co-operate for the good of themselves by editing their local advertisements on the same plan which the Cycle Age will follow in its reading matter. By energetic pursuance of this plan it is believed that they will be rewarded by better prices in the summer and fall and ability to keep a larger stock without much risk of loss by depreciation if it should come about that they are obliged to hold a part of their stock from one season to the next.

### LANCING A PIMPLE

It is time to lance the pimple who edits the Cycling Gazette—the scavenger among trade journals. Being on the fringe of that group in the fourth estate which disdains responsibility for its writings, he naturally sees no special reason for adhering to the truth if a lie adroitly slipped into print will equally serve his purpose.

As a practitioner of malignant mendacity the pimple is facile princeps—which done into a language that will not perplex his intellectuals means that he is "the brightest of them all," or the most complete pimple ever protruded. Here is a specimen of his art:

And now to dispose of subjects concerning the Cycle Age, let us touch upon the anti-show letters which are being run in weekly installments. From reliable sources we have learned that these letters were written away last summer, when the show question was as remote as anything possibly could be, and that they were addressed to the Board of Trade's secretary. Perhaps you will notice that no date lines are connected with the various missives as they appear in print.

None of the manufacturing firms which lately received letters from the Cycle Age asking for opinions on the show question will dare to taint their honor by avowing that the printed replies were "faked."

For the Cycle Age has the originals in its possession.

### PROFITS OF MANUFACTURE

Much of the discontent afflicting the labor ranks of contemporary industry may be traced to blind interpretations of the widely and often injudiciously published figures of manufactures. A common error on the part of those whose knowledge of commercial science is bounded by the results of the application of the four fundamental operations of arithmetic to the statistics happening before them, consists in deducting the cost of materials and the sum of wages, combined, from the gross values of the products, and then in assuming that the remainder constitutes the profit of manufacture. No more erroneous or fallacious deduction could easily be made, for only analysis of any branch of manufacture, expertly made, can show how large a part of the gross proceeds from the sales of goods must be applied to miscellaneous or general charges and

overhead expenses. There is nothing which an expert statistician or census specialist avoids so scrupulously as putting questions which, if answered, would disclose the profits of any business; because he knows that if the questions are so framed he will either receive no replies at all, or else partial or incorrect replies intended to mislead. Therefore any and all deductions of alleged profits from whatever source are apt to be mere hazards of opinion.

The year 1890 was unquestionably a prosperous one, and there may have been an average profit of ten per cent in the manufactures of that year. Since then the customary rule has held good—more capital has been invested; there has intervened a long period of depression; the margin of profit has diminished, but the wages of labor have, as a rule, not suffered. The adjustment of commercial conditions is now again about complete, and there has never been a period in the history of this or any other country equal to the present in the United States in the following particulars:

1. So large a product made and distributed at so low a cost in ratio to the capital invested, either in production or in the mechanism of distribution.

2. So low a rate of profit sufficing to satisfy capital and to induce further investments.

3. So high a general wage rate earned by so small a number of hours of work.

4. So large a purchasing power in each unit or dollar of the wages or earnings, when expended for the necessities or comforts of life.

5. In no other previous period has the workman received so large a proportion of the joint product of labor and capital, or its equivalent either in money or goods.

From investigation experts are thoroughly convinced that ten per cent is the maximum margin of profit on all production in this country.

\* \* \* \*

Impressive expression is given to the value of our cycle export trade by stating that it is about one-fifth as large, both in money and volume, as the home trade. So confident a computation requires a few figures in order to make it stick. Let it be said that the gross valuation of the cycle products for the past year was \$44,000,000 or thereabouts; that is to say, 1,250,000 machines were sold at \$35 apiece—the average price at which the bulk of goods, fully equipped, were retailed. The value of the exports will reach \$7,000,000 for the same period. But their valuation is net. Add the trade discount to the exports, and the conclusion is approximately as stated at the outset. Or if exception is taken to this method of figuring, deduct the average trade discount from the gross sales in this country and divide by the net value of the exports—the result will still remain about the same. No notice is here taken of the value of materials, sundries and parts shipped abroad, but even making the freest allowance for this, it will not be necessary to materially amend the original statement.

\* \* \* \*

Consigning goods to foreign buyers is becoming a common practice with cycle making firms which are more eager than wise in extending their trade connections. It is egregious folly to court risks of this character, for if the goods are not readily accepted they are invariably offered at reduced valuation to parties who time their appearance in such transactions by previous arrangement with the original consignees. Recent disclosures show how easily some of our firms are victimized and how severely they have suffered in consequence of their indiscretions. One house made a heavy shipment of bicycles to Europe, failed to satisfy the buyers, reshipped the goods to three different ports, and finally was compelled to sell them at \$15 apiece, completely equipped, which was half of their invoice valuation. On this subject the following letter has been received:

We have a letter from a prominent bicycle dealer in Europe, not our customer to the effect that the trade is in a bad condition over there in many of the chief markets on account of the fact, as he states, that many consignments are made to parties over there on credit or sight drafts, payable there when the goods arrive. When the goods arrive the consignees raise a technical question with regard to them, forcing the consignors to make a liberal allowance before they take the goods, and many times making the net prices of the goods far below the prices they can be sold at with any profit; consequently the party obtaining them becomes the

worst kind of competition, as he is able to sell below legitimate prices, thereby demoralizing the trade generally.

No manufacturer should make a consignment to Europe to be paid for against sight draft when the goods arrive, without having a deposit in New York of at least 25 per cent of the amount necessary to cover the consignment. Still better, they should have the goods paid for in New York.

Chicago, Dec. 21.

MONARCH CYCLE MFG. CO.

Here is the foreign trader's opinion on the subject:

I have this year imported 12,000 American bicycles, being upwards of one-half of the entire import of bicycles in Scandinavian countries. The competition of England and Germany is nearly crushed, and the home manufacturers do not amount to much.

The worst competition I have to fight against comes from America itself, and arises from the fact that American manufacturers and jobbers ship goods here not paid for in full at New York. The goods are refused by the consignees and sold here at auction. The American bicycle trade suffers through this ruinous system. All orders and goods passing through my hands are invariably paid for in full at New York against bill lading, and the credit placed in New York same time as order. Every respectable firm on this side pays that way.

Why, then, ship goods over here not paid for when it is not necessary in order to do the business? It assists unscrupulous dealers on this side, and it will be sure to end disastrously for the exporters and do great harm to the regular trade generally.

Copenhagen.

JENS NIELSON.

\* \* \* \*

Should success crown the efforts which are being made to recruit the retailers for the purpose of making war upon the express companies, against whose extortionate charges all protest, there will be general rejoicing in trade circles. The movement is meeting with surprising encouragement from the cycle trade, which for a long time, through the instrumentality of the National Cycle Board of Trade, has sought to be rid of the oppression of the carriers. With characteristic blindness the manufacturers' organization arrogated to itself the solution of a problem which chiefly concerned the agents. It fiddled with the whole subject of transportation until it became a jest in the trade. It was not perceived—or if perceived then not emphasized until too late—that the agents paid all the costs of shipment, and for that reason should have been leaders in the reform. As petitioners whose chiefest concern—sentiment rather than real—was in lightening the burden of their customers, and not in sharing it, the board transportation committees never had any influence with the railroads on the rare occasions when they appeared before freight classification authorities. Their efforts to persuade the express companies to reduce their rates were for similar reasons impotent. It is the curious fact that throughout the whole history of the board there was exhibited a cynical disregard of the agent's true welfare and the improvement of the conditions which bind him to the maker and cause both to prosper. However, with decent luck, the agent should soon be in a position to favor the manufacturer with benefits proceeding from a reform the latter vainly attempted to secure, for fast freight as a substitute for express has been tested too often to fear a breakdown in the plan which is maturing, and parcels post will cover up any deficiencies which may appear in it.

\* \* \* \*

The show dates should have been much later. But when a promoter cannot get later dates, and is very certain that he will have a large attendance of the public in January, he is in a position to say to the manufacturing trade: "What are you going to do about it? I am in this business to make money. I find I cannot make it in March; hence I will make it in January. Very sorry, gentlemen—for you."—The Wheel.

Why should the show promoter make his needs superior to those of the trade?

# THE KING IN YELLOW

The time and money expended by the dealer in popularizing the wheel he represents is capital invested.

That capital will return dividends according as the bicycle he handles shall establish its value before the people.

The bicycle is a machine that deals with complex problems of mechanics and motion. Its builders must possess a deep acquaintance with the possibilities and limitations of the art—and, knowing them, must apply them rightly.

The makers of Stearns Bicycles have studied the needs of the business—their every improvement is toward the simplifying and perfecting of the bicycles they build.

The dealer who desires to maintain a successful business will build the structure of that business upon a good and permanent foundation.

The agents for Stearns Bicycles have found in the wheel they handle the full pledge of its value.

**FRED KRONER HARDWARE CO.,**  
Wholesale Hardware.  
LACROSSE, WIS., June 8, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.

Gentlemen: In reply to your inquiry regarding our experience with your puncture-proof tires, will say, that our customers, who have used your tires are perfectly satisfied and would not go back to other makes again, as they are now saved a great amount of time and trouble which they formerly had in repairing punctures.

We had a pair of your tires on exhibition in our store, which we road over a board full of tacks some 300 times, and then sold them to a rider who uses them on his wheel and is much pleased with them.

So far as we can see they cannot be punctured by rough usage, say nothing of ordinary riding. We can fully recommend them. Yours truly,

(Signed) FRED KRONER HARDWARE CO.

**MacDONALD & WESSELLS, Wholesale Bicycles and Supplies.**  
DETROIT, MICH., Nov. 19, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
We have thoroughly tested your puncture-proof tires, and found them to be even more than you claim for them. The writer has ridden a pair for the past two months and takes pleasure in recommending them.  
Yours very truly, (Signed) MACDONALD & WESSELLS, per D. MacDonald.

**DAVID AHERN & SON,**  
Sanitary Plumbing,

Steam and Hot Water Heating.

FOND DU LAC, WIS., DEC. 2, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.

Gentlemen: Your inquiry of Nov. 30 received. In reply will say that I have been using a pair of your tires since last May every day, and think they are in as good condition as when I got them. Never had one minutes trouble with them, something I cannot say for the two different makes that I used before I used yours. You have a good thing.

Yours respectfully,

(Signed) JOHN F. AHERN.

**HOTEL ST. JAMES, Geo. C. Rembaugh, Prop.**  
WINFIELD, KAN., Dec. 2, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen I have ridden a pair of your puncture-proof tires about 800 miles without an accident, although I have ridden over every broken bottle that presented itself, and have gone out of my way to run through hedge thorn brush. Formerly I averaged a puncture a week. Your tire is alright.  
Yours truly,

(Signed) GEO. C. REMBAUGH.

## A PROFITABLE SIDELINE

### Electrical Supplies May be Handled With Great Advantage in Small Towns

As a side line for bicycle dealers electrical supplies should command more than ordinary attention. That these goods are not more extensively handled is chiefly due to the false assumption, commonly entertained, that the dealer in them must be a sharp in electrical knowledge. If country retailers will get over this absurd notion they will find the line highly profitable throughout the entire course of the year.

#### Small Opportunities in Large Cities.

In the large cities—those having a population of more than 100,000—the electrical trade reaches a volume sufficient to support dealers handling nothing but electrical supplies, but the many smaller cities and towns with electric light plants cannot support separate dealers in this line. The consequence of this is that the electrical business is largely undeveloped outside of the large cities, for the reason that no one capable of handling the trade is at all interested in the matter. It is the testimony of a manufacturer of electrical machinery who contributes his impressions upon the subject to the *Iron Age* in the hope that hardware men will profit by his advice.

#### Large Opportunities in Small Towns.

The average electrical dealer in smaller places is either a young fellow fresh from school or college, who has picked up a smattering of electrical knowledge, and who, by reason of this, is looked upon by his associates as a budding genius, but who is absolutely destitute of business training or financial responsibility; or he is an electrical workman who has accumulated a little money and is equally without real business experience. It is, of course, impossible for such persons to handle any business with the greatest amount of success to themselves or satisfaction to their customers. Instead of being surprised that so many such people fail, the real wonder is that so many succeed; and the fact that many do succeed proves that the supply business has great possibilities for any man of business experience and sagacity who gives it the proper attention.

In many instances the electrical trade is handled by the electric light stations, but as they are interested only in such supplies as conduce to the extension of their own business, they develop the trade only to a very limited extent. An electric light station is not fitted for carrying on a trading business, and most of them would be only too glad to turn this business over to any dealer capable of taking care of it, and in addition would give this dealer all assistance and information in their power.

#### How to Start in Business.

The selling of electrical supplies does not call for any more knowledge than any other line of merchandise, and is, in reality, not nearly so complicated as many imagine. The way to start a successful business in this line is to employ some young man with a little electrical knowledge, let him attend to the electrical questions, having him under strict supervision to see that the business is handled on conservative lines. A good start can be made with a very small outlay—a few lamps of the style used by your electric light station, some lamp cord, sockets, switches, a few electric bells, batteries,

etc., buying everything in small quantities and expanding the line as the growing business demands. The retail profit on almost all items is large, and in many other ways the electrical line works in well. In the fall and winter months the sale of incandescent lamps is large, and as these are continually being broken or burning out, this fact assures a steady business.

#### All the Year Round Trade.

In the spring and summer months a large business can be worked up in fan motors, this line running rapidly into money with good profits at a time of year when general trade is dull. The man who has a bicycle repair shop is particularly fitted for electric wiring and simple repairing, as most of the troubles in common electrical apparatus are readily located and repaired by anyone with ordinary mechanical ability. Most of these defects show up in the fall when people begin using lights extensively, and the busy season in electrical wiring and repairing is just when the bicycle repair man is enjoying a period of leisure.

#### The Business is Readily Learned.

Most people look upon the electrical business as a matter entirely beyond them, but there is absolutely no reason for such a belief. It would not have been possible five years ago, or even two years ago, for the bicycle dealer to enter on this line, as the manufacture of electrical appliances was largely in the experimental stage. The past two years, however, have practically standardized this line, experience and use have sifted the good from the bad, and there is no more danger of change in this line than in any other line familiar to the dealer.

#### Guide for Buyers.

The National Board of Fire Underwriters issues free to any applicant a book called "National Electrical Code," giving the approved practice in all electrical matters. This, in connection with their "List of Electrical Fittings," will prove a sure guide to the buyer until he can rely upon his own judgment. The difficulty the retail buyer will first experience is to find out where he can buy these various articles to best advantage.

#### Profitable Merchandize.

That the addition of electrical supplies by the retailer would largely increase his sales and provide him with a new line of profitable merchandise is an indisputable fact. The handling of this line will place the electrical supply business in the hands of experienced business men, who are fully capable of taking care of the consumer, and who will at the same time command the confidence of the electrical jobber and manufacturer. This is a condition that is longed for by all electrical jobbers and manufacturers, and would result in a development and expansion of the use of electrical supplies in the smaller cities and towns that is at present but dimly realized.

#### Chain "Fake" of the Century.

The cycle trade in this country has heard enough of the magical virtues ascribed to the Simpson lever chain to read with interest the humbuggery which, in connection with it, the sly Hooley practiced on people whose confidence he

gained. Hooley was recently examined for the purpose of ascertaining his connection with the \$1,250,000 Simpson Lever Chain and Cycle Co. It was shown that the price of the chain patents was \$1,000,000. One of the directors of the company was asked what made him think the patents were worth so much, and he replied that Martin Rucker told him in the presence of Hooley that no bicycle would be made in future without being fitted with the Simpson chain. Hooley sold him 20,000 shares for \$25,000. Not the least interesting part of this witness' examination was the production of a number of telegrams from Hooley, in which it was said: "Everything going splendidly; just received offer for American and Canadian patents for £5,000,000, with a royalty of one dollar." Before the shares were allotted Hooley had bought the patents for \$75,000.

### SHAPING OF TUBE ENDS

Fitting Tube Ends to Cylindrical Surfaces at an Angle by Means of End Mills.

Many cycle builders whose machines have flush joints use a construction which requires that the tube end be formed to fit against the other tube forming the joint. To obviate both expensive jigs and machinery and the somewhat common practice of forming the ends by hand filing, the end milling cutter may be used to advantage. The end mill can be used in an ordinary drill press and the jig necessary for holding the work can be made so sim-

ple that the expense of rigging up will be slight. The arrangement of the jig and its relative relation to the end mill when both are in place on the drill press is shown in the accompanying illustration. The mill, B, is a regular end mill of an outside diameter equal to that of the tube to which the formed tube joints, which in the case of forming the forward ends of the upper and lower frame tubes will be the steering head. The thickness of the cutting wall should be in the neighborhood of an eighth of an inch. The casting forming the jig is arranged with a vertical hole down through its center in which hole an accurately bored steel bushing, F, is placed to act as a guide for the cutter. From either side of the casting a hole is drilled entering the central hole. One of these holes has the same angle with the vertical hole as has the lower frame tube with the steering head of the bicycle frame for which the tubes are being formed. The other hole has the angle of the upper bar with the head, and for bicycles in which the seat mast and steering head are parallel, this angle is also the proper one for forming the rear end of the upper frame tube. A transverse slot through the jig receives a pin, E, which acts as a stop for the tube, C, when it is first placed in the jig preparatory to the forming process. As soon as the tube has been pushed down to the pin, the screw, D, in the side of the jig is

tightened sufficiently to hold the tube in place. The pin, E, is then withdrawn and by a movement of the operator the mill, B, is lowered and the cutting commenced. The cutting obtained by this process not only leaves the tube end with the proper amount of metal taken out, but with the ends of the tube wall beveled to fit accurately against the tube it is to join. A little practice with the device will enable the operator to turn out the work very rapidly. The vertical hole through the center of the jig should extend clear through the casting so that the stubs cut off from the end of the tubes may fall down out of the way.

**TRADE MOVEMENTS**

**Big Water Cycle Company Formed—Connecticut Concern Sells Out—Small Spaulding Settlement.**

The International Water Cycle company of San Francisco has been incorporated with a capital stock of \$250,000, of which \$130,000 has been subscribed. The directors are Franz O. Winqvist, Henry J. Gerdau, Emil Olssen, Thomas Le Huguet and J. F. Pfetch.

The entire property and assets of the Hopkins & Allen Manufacturing company, of Norwich, Conn., manufacturers of fire arms and bicycles, have been bought by a syndicate and an entirely new company will be organized. The manufacture of bicycles will be discontinued.

Most of the merchandise stock of the Spaulding Machine Screw Co., of Buffalo, having been sold under the receivership before the sale of the plant at mortgage sale to John R. Keim, which wiped out most of the assets, there is only \$7,500 on hand, which, with the book accounts, is all the assets that remain to be divided between the creditors.

A demurrer in an action for \$12,000 damages for trespass entered against Sheriff McCormack, of Laporte county, Ind., for seizing the machinery of the Allen Mfg. Company, which made bicycles in the Michigan City prison, under writ of replevin secured by the receiver, has been overruled. The judge held that under the Indiana law a sheriff can take property only on a writ of replevin from a defendant in a suit and is liable to action for trespass if he oversteps himself.

Oscar S. Lear, a bicycle dealer of Columbus, O., has established a branch in Cincinnati. Just now he is handling nothing but typewriters there, but in the spring will put in a stock of bicycles. During the past summer he operated a store in Springfield, which was closed temporarily some weeks ago for the winter, but in the spring it will be opened again.

The copartnership formerly existing between Kelly & Haworth, in Greentown, Ind., has been dissolved, and the firm is succeeded by the Kelly Mfg. Co. in the manufacture of tire repair tools.

**TUBELESS CLINCHER TIRES**

**English Designs Involving Two Principles—How Air Pressure Seals Meeting Edges Air Tight.**

In the illustration is pictured the construction of a new English tubeless tire of the clincher pattern. The edges of the tire are made of flexible canvas formed into square section and covered on all sides with a thin layer of rubber. The rim is made with parallel upturned edges and a depressed center, so that while shoulders are formed on which the square edges of the tire rest, the edges do not touch the rim where they come together. The distance between the two edges of the rim is slightly less than the normal distance across the two squares so that when the

tire is in place on the rim the joining faces of the square edges will be pressed tightly together. The squares being unsupported at their joining corners, the increase of air pressure inside the tire, upon depressing the interior of the tire toward the axis, suppositiously, causes the joint to become still more tight and the tire to be still more securely held on the rim. The natural tightness with which the tire fits the rim allows it to be ridden deflated without danger of coming off and the square edges being higher than the rim prevents injury to the tire when it is ridden deflated.

The unsupported center of the above tire is a new point in the development of tubeless clincher tires. In the lower illustration is shown a section of a popular

English single tube tire, the Trench, in which the large contact surface between the joining edges of the tire is attained by means of triangular projections above bases which have the same approximate form as an ordinary clincher double tube tire. These projections thus give practically the same results as the large square bases of the tire first mentioned, with the exception that the compressive power is not as strong at the top of the joint as at the bottom, where in the case of the square bases the pressure is the same both at top and bottom or with a slightly stronger pressure at the top of the joint. In the lower tire as in all forms of such

tubeless clincher tires with the exception as stated, of the square based one, the bottom of the tire lies flat on the rim from edge to edge.

**Reduction Due to Automatic Machinery.**

Announcement is made that Humber & Co., Ltd., of England, who have heretofore strongly maintained that it was impossible to build good, serviceable bicycles to sell for less than \$100, will make a specialty the coming season at their great Coventry factory of a line of road machines, in models for men and women, to list at \$52.50. The production of these, which, it is said, will be of distinctly Humber quality and bear the Humber trade-mark, to sell at this price, is made possible by the recent introduction of labor-saving machinery.

**Wood Rims in Scotland.**

American firms wishing to push their goods in Scotland should know that wood rims are well regarded; indeed, of late it has been very common to see British

bicycles with their metal rims painted a buff color, and in some cases grained in imitation of wood. Many British manufacturers are fitting wood rims to their new models.

**Profits of English Makers.**

"Kick 'em out," yelled a holder of half a dozen or so shares at a recent English cycle company meeting, referring to his directors. Why? Because, for the first time on record, the dividend had fallen below 10 per cent! This incident in part reveals the temper of stockholders in English concerns. Late company reports are as follows:

	Loss.	Profit.
(a) Smith Stamping Co. ....		\$38,925
(b) Triumph Cycle Co. ....		47,610
(c) Australian Cycle & Motor Co. \$40,000 .....		
(d) Townsend Cycle Co. ....		9,135
(e) Beaton Cycle Co. ....		8,165
(f) Lloyd's Cycle Fitting Co. ...	No dividends.	
(g) Empire Tube Co. ....	20,000	
(h) Coventry Cross Cycle Co. ..		9,190
(i) Progress Cycle Co. ....		16,840
(j) Humber & Co. ....		110,715
Preston-Davies Tire Co. ....		15,935
(k) Singer Cycle Co. ....		135,265
(l) Swift Cycle Co. ....		169,725
(m) Components Tube Co. ....		5,045
Reuben Chambers (fittings)...	9,640	
(n) Rossleigh Cycle Co. ....		33,740

- (a) No dividend was declared.
- (b) A dividend of 5 per cent was declared.
- (c) The fate of this company will be determined in February at a meeting of the stockholders.
- (d) A dividend of 5 per cent on ordinary shares was declared.
- (e) No dividend was declared. The sum of \$6,000 was passed to reserve.
- (f) As a result of orders booked at the shows this concern hopes to pay a dividend next year.
- (g) This concern will be wound up at once.
- (h) A dividend of 5 per cent was declared.
- (i) A dividend of 7 per cent was paid on preferred stock and 10 per cent on common stock.
- (j) A full statement of the affairs of this company recently appeared in this paper.
- (k) A dividend of 4 per cent was declared on common stock and 5½ per cent on preferred stock.
- (l) A dividend of 6½ per cent was declared on preferred stock and 4 per cent on common stock.
- (m) The actual trading profit of this concern was \$300, the directors refunding fees to the amount of \$3,000. The remainder was obtained from dividends on investments of company funds.
- (n) This concern also makes motor vehicles. A dividend of 10 per cent was declared on common stock and 6 per cent on preferred.

**Cancellation of Contract.**

The Cycle Age has been requested to give publicity to the following self-explanatory letter:

To the Editor:—You are hereby notified that the contract and agreement heretofore entered into between the American Electric Vehicle company and the Indiana Bicycle company, whereby the latter company undertook to build the American electric vehicles for this company, was canceled and terminated October 4, 1898, and said Indiana Bicycle company now has no right or authority to build or sell the American electric vehicles or vehicles made in accordance with the patterns or under the patents of the American Electric Vehicle company, and has no authority to deliver said vehicles, although contracted for or commenced during the continuance of said contract. The vehicles of the American Electric Vehicle company are covered by letters patent owned by this company, and any purchasers of such vehicles from unauthorized parties will render themselves liable for infringement.

AMERICAN ELECTRIC VEHICLE CO.  
By C. E. Corrigan, General Manager.

**Pope Bevel Gears in England.**

The Pope company has made arrangements with Brown Bros., a large English supply house, whereby they will carry a complete line of frames and gears for making bevel-gear chainless bicycles. Brown Bros. will supply the English and European trade.

W. J. Bloom, a well known jobber of bicycles and parts in London, is at present in Chicago, and can be addressed from now on in care of Cycle Age.

# COMMERCE IN FOREIGN MARKETS

**OCEAN FREIGHT RATES ON BICYCLES**

Ocean freight rates from the port of New York to some of the principal points of destination and distribution for American bicycles are enumerated in the table here-with presented. The rates are all based on cubic measurement, 40 cubic feet being a ton measurement. One crated bicycle will measure about 10 cubic feet.

- Copenhagen, \$4.85 and 5 per cent per 40 cubic feet.
- Christiania, \$4.85 and 5 per cent per 40 cubic feet.
- Stockholm, \$6.06 and 5 per cent per 40 cubic feet.
- Hull, \$4.85 and 5 per cent per 40 cubic feet.
- Newcastle, \$4.85 and 5 per cent per 40 cubic feet.
- Glasgow, \$4.85 and 5 per cent per 40 cubic feet.
- Liverpool, \$3.03 and 5 per cent per 40 cubic feet.
- Manchester, \$3.64 and 5 per cent per 40 cubic feet.
- London, \$3.64 and 5 per cent per 40 cubic feet (prompt).
- London, \$4.28 and 5 per cent per 40 cubic feet (warehouse delivery).
- London, \$2.43 and 5 per cent per 40 cubic feet (yearly contract).
- London, \$3.64 and 5 per cent per 40 cubic feet (yearly contract warehouse delivery).
- London, via Southampton, \$4.28 and 5 per cent per 40 cubic feet.
- Hamburg, 10 cents per cubic foot, net.
- Rotterdam, 10 cents per cubic foot, net.
- Antwerp, \$3.64 and 5 per cent per 40 cubic feet.
- Havre, 12½ cents per cubic foot and 5 per cent.
- Marseilles, \$6.74 and 5 per cent per 40 cubic feet.
- Trieste, \$6.74 and 5 per cent per 40 cubic feet.
- China and Japan, \$7.88 net per cubic feet.
- Bombay, \$7.88 and 10 per cent per 40 cubic feet.
- Calcutta, \$9.09 and 10 per cent per 40 cubic feet.

**CANADA'S PREFERENTIAL TARIFF**

It is admitted that even with the 25 per cent. tariff advantage it is impossible for British manufacturers to compete with us in Canadian markets. It is further admitted that the disposition to take advantage of the preferential duty favoring Great Britain is offset by a tendency on the part of the Canadian importers to await the outcome of the present reciprocity negotiations at Washington before transferring orders from the United States to British houses. Taking the four months ending with October, during which the preferential duty has been in force, the importations of British goods appear to have slightly increased on the bulk of the list as compared with the corresponding periods of 1896 and 1897.

**LIST PRICES ON ENGLISH CYCLES**

Many of our bicycle makers imagine that the list prices of all English models, with few exceptions, are about the same as are found in this country on machines of equal grade and reputation. In disproof of this belief, the following published quotations of two representative English cycle making firms—net cash to the rider—are submitted:

**Bayless Thomas & Co.'s Models and Prices.**

	Price.
First grade men's machine .....	\$33.50
First grade women's machine .....	36.00
Second grade men's machine .....	60.00
Second grade women's machine .....	62.50
Boys' machine .....	43.00
Girls' machine .....	44.00
Tandem ..	115.00

**Premier Models and Prices.**

	Pounds.	Price.
Men's roadster .....	31	\$105.00
Ladies' roadster .....	29	105.00
Road racer .....	25	95.00
Men's roadster .....	31	87.50

Ladies' roadster .....	30	90.00
Men's roadster .....	31	72.50
Ladies' roadster .....	31	72.50
Road racer .....	26	70.00
Men's roadster .....	32	62.50
Ladies' roadster .....	31	65.00
Men's roadster .....	32	52.50
Ladies' roadster .....	32	57.50

The high prices asked for juveniles, as well as the evident determination to get more for women's models than for men's, are distinguishing features of the foregoing quotations.

**NO BANKING FACILITIES ABROAD**

The defeat of the bill to incorporate the International American Bank leaves American merchants without any banking facilities in the new dependencies, except those which may be provided by private banking houses or by the old methods of buying exchange through London for the benefit of British bankers and British exporters. It is possible that Representative Hill of Connecticut will succeed in his plan for passing the senate bill to incorporate the International Bank after the holidays, but there is some doubt both as to getting time for it and as to getting a majority of votes.

One of the amendments adopted authorized the bank to do business in all foreign countries by means of branches, and another amendment authorized any body of capitalists raising a capital satisfactory to the comptroller of the currency to take advantage of the provisions of the bill. These provisions would have paved the way for American banking in the dependencies. There is nothing to prevent private banks of discount and exchange from establishing branches, but it is doubtful whether they will have sufficient prestige to compete with the great English banks whose immense capital and control of the exchange business have given them the monopoly in nearly all countries of Latin America, Africa and Asia.

The reason for the defeat of the International Bank bill seemed to have been a vague prejudice against granting the power of establishing branches to one bank without granting it to all. It was not exactly apparent whether there was a prejudice against branches as such, or only against granting the power to one bank without granting it to existing national banks. The roll-call in the house showed that seventy-two Republicans were among the 100 members who did not vote. If they had been present and voted for the bill, even with the absent Democrats recorded against it, they would have brought it within one vote of success.

If no legislation is obtained at the present session, it is not unlikely that the entire question of money and banking in the dependencies will be referred by congress to a special commission appointed by the president, or to a joint committee of the two houses.

**EXHIBITION FOR FOREIGN BUYERS**

Congress has authorized the holding of a national exposition of American products and manufactures especially suited for export, at Philadelphia, in the coming year. The main objects of the exposition are: (1) To show to foreign buyers the goods American manufacturers offer for export, and to establish their superiority; (2) to show to American manufacturers the character of the goods they must compete with in the open markets of the world; (3) to show how American goods should be packed, labeled

and put up for export trade; (4) to bring the manufacturers and merchants of the United States in direct personal contact with the principal buyers, merchants and bankers of foreign countries.

The exposition will remain open for five months from May 10.

**AMERICAN DROP FRAME MODELS ABROAD**

American bicycles, particularly ladies' models, are frequently seen on English, Irish and Scotch highways. Many of our high grade models are well represented in the shops of Edinburgh and Leith, as are most of our cheap patterns. One of the best known American firms has only been moderately successful in introducing its models, even at a very reduced price, because the managers have up to the present refused to change them to suit British tastes. Another equally well known firm is able to sell many machines in Leith at a figure slightly in advance of the highest price usually charged in the United States, largely because they have met British tastes and requirements. One particular concession they make is a choice of any tires, British or American, detachable or otherwise.

**OPENING TRADE IN PORTO RICO**

Private advices state that Perry D. Gath, formerly a very successful bicycle dealer here, is now in San Juan, Porto Rico, selling bicycles for a well known Ohio concern. He reports that he is selling more machines there than he did here in 1894, which means a large number to those who know how many he sold here then. A paper published in San Juan, which was received here recently, contained a large display advertisement of Mr. Gath's business. He is selling a good many machines to soldiers and some to natives, who take delight in spinning over the beautiful roads of Porto Rico. Mr. Gath delights in novelty and adventure and is just the man to open up the cycle business in that newcomer of the United States.

**INVENTORS' BANK IN AUSTRIA**

The Austrian government has granted a concession for an inventors' bank. The capital is to consist of \$100,000, in shares of \$80 each. By a resolution of the board of directors this amount can be raised to \$200,000, and to \$400,000 on ratification by the government and stockholders. The aim of the bank is to be the utilization of inventions and patents for the mutual benefit of the inventor and the bank, which may involve the erection of factories for the production of patented articles, the founding and management of trade enterprises for the sale of these articles, and the right of the bank to carry on all other legally licensed businesses which are adapted to encourage the activity of inventors in Austria. The capital for this new enterprise has not yet been procured. The privilege has been granted for six months. If the company is not formed, the concession is withdrawn.

During four months from July 1, last, nearly 1,000 bicycles were stolen in the city of Chicago.

The emperor of Morocco, who only a short time ago purchased a luxurious cycle-wheeled cab from one of the largest manufacturers, has now forbidden the use of the cycle in his domains.

## ELECTRIC TEMPERING

### Small Articles Conveniently Hardened by Electrolytic Bath —Correct Heat Produced Instantly When Required

New methods for hardening metals and otherwise changing their molecular structure seem to be coming to the surface lately with great frequency, probably on account of the unusual activity which has marked the iron and steel manufacturing industries and the ceaseless activity in the laboratories of large plants which the progress of metallurgical science and the exigencies of competition have called forth. An interesting process in this line of work is recorded in patent No. 614,928, granted to George D. Burton, of Boston, on November 29. It refers to a method for tempering, and also annealing metals by immersion in an electrolytic bath. The object of the process is not only to facilitate the operation, but also to avoid scales on the surface of the metal. Briefly described, the process consists in subjecting the metal to the action of an electric arc formed between it and an electrolytic bath until the proper heat is obtained, then cutting off the current and permitting the article to be cooled in the bath, the heating and cooling operations being performed without removing the article from the bath.

#### Tempering Part of an Article.

An important application of the method has reference to the hardening of a portion of a metal tool or other article by immersing only the portion to be hardened while the remaining portion is kept out of the bath, practically unheated and unchanged.

The accompanying illustration shows an apparatus for carrying out the process. It comprises a tank to contain the electrolytic solution, lined with material which is a non-conductor of electricity. An anode plate is placed in the tank at any convenient point and has a contact surface much greater than the area of the article to be heated. It is composed of lead, carbon or other suitable conductive material and is provided with a fixed rod extending above the top of the tank. The plate is protected by a non-conducting screen, and is connected with the positive pole of an electric source. An upright cylinder is supported in a socket in the bottom of the tank and is composed of an outer tube of wood and an inner tube of asbestos, wood or rubber. A wood plunger with a longitudinal groove and a metallic conductive cap is arranged to play up and down in the cylinder, and a depending bracket is hung upon the cap. This bracket has two arms with out-turned flanges at their lower ends, to which a work-holder is attached. The work-holder is made in various forms according to the work to be done, being usually provided with clamping jaws and springs for holding the work against a non-conducting plate while the springs also serve as conductors for the electric current. The plunger—and consequently the work holder—is lowered by a foot-lever and raised by a spring so as to facilitate the immersion or withdrawal of the work from the solution. A conductor is connected at its inner end to the metallic cap on the plunger and lies in the groove thereof. A switch is preferably disposed on one side of the tank and provided with two contacts and a switch-lever. The outer end of the conductor is connected with one of the contacts, and the other contact is

connected with a branch of the main conductor, leading to the negative pole of the electric source. When the switch-lever is in operative position the current passes from the anode-plate through the solution to the work and an arc is formed between the work and the solution, the current passing to the negative pole through the clamping-jaws, studs on the bracket arms, springs, bracket, cap, and conductor in plunger, switch, and main conductor.

#### Suitable for Intermittent Work.

The work remains in this position with the current on until the portion thereof to be tempered is sufficiently heated by the arc, and then the switch is operated to break the circuit. The arc then disappears and the solution immediately comes in contact with that part of the work which has been heated by the arc. The work is held in this position and is cooled by the action of the liquid in the

same liquid in which it was heated. When sufficiently cooled, the lever is released by the operation of the spring, causing the work-holder to lift the work out of contact with the solution. The work is then taken from the work-holder and another article placed therein and the operation repeated.

A special arrangement for annealing by resting the metal articles in contact with a conductor in the bath is provided at one end of the tank. It seems to be of less direct application to the bicycle and allied industries than the tempering process and is therefore not described here.

#### Chemical Composition of Bath.

In regard to the chemical ingredients used in the solution the inventor states that the electrolyte should be of a specific gravity greater than that of water, and it may consist of an acid or an alkaline watery solution, preferably the latter.

The chemical ingredients added to the water produce the necessary density in the bath to cause the heating action to take place, increasing the conductivity thereof and facilitating or enabling an arc to be formed between the metal and

the liquid. A density of at least 1.025 to 1.105 should be used. When it is desired to harden the metal to a considerable degree, the bath should be of a greater density, and consequently of a higher conductivity, say 1.200 to 1.250.

For hardening steel or iron a bath of chlorid of sodium and sulfuric acid may be employed. He has used for this purpose a bath composed of seventy-two gallons of water, three gallons of sulfuric acid, and fifty pounds of chlorid of sodium or rock-salt.

For annealing or softening iron or steel he has used a solution composed of a barrel of water, five pounds of borax, and five pounds of sal-ammoniac. This bath will answer also for the softer metals, such as brass or copper and compositions of these metals.

So far the process seems to have been used chiefly in the manufacture of saw blades for the purpose of tempering the cutting edge without making the rest of the blade brittle, but its availability for other purposes where thin steel articles must be tempered on the surface or in part seems obvious.

### QUICK GEAR COMPUTATION

#### Simple Manner of Instantly Finding the Gear of Chainless and Gear-Cased Bicycles.

It frequently happens that riders and others wish to compute the gear of some bicycle without going through the labor of counting the teeth of both sprockets and of figuring up from the data thus obtained. A method which is approximately accurate and which entails no counting and but little mathematics is as follows: The cranks are first brought to some definite position, say either horizontal or vertical, and while they are in this position a mark is made on the rear wheel rim where it crosses the line of the rear stay tube or any other permanent point which may be used as a guide. The cranks are then turned through one complete revolution and the new position of the mark on the rear rim noticed. If the diameter of the rear wheel be now multiplied by the number of revolutions it has made while the cranks have made but one revolution the gear of the machine is obtained.

For example, suppose that a 28-inch rear wheel has made two and three-quarters revolutions to the cranks' one, the product of this number and twenty-eight is seventy-seven, the gear of the bicycle. As machines are usually geared to more than twice the diameter of the rear wheel it is only necessary to observe through what part of a revolution the mark has advanced over its original position, and this can generally be done with sufficient accuracy by passing judgment with the eye, although if desired the spokes in the wheel can be used as a guide. If the machine has the appearance of having a very high gear the rear wheel must be watched to see if the revolutions made are not three and a fraction instead of two and a fraction. This method of gear computation is obviously very useful in determining the gear of a bicycle in which the driving gear is encased.

### Important Engineering Work.

Good roads decrease taxation, decrease living expenses, increase property values, promote prosperity, and advance civilization. Macadam roads, properly constructed, are the most satisfactory and cheapest roads yet invented. All road work should be done with a view to its permanency. Trained labor and competent engineering supervision are as important in building public wagon roads as they are in the building of railroads.

## RECENT PATENTS

### Up and Down Driving Movement for Tandem—Flush Joint Hanger—Auxiliary Handle Bar Grips

**Tandem Driving Gear.**—The object of this gear is twofold; it dispenses with the second chain and its sprockets and substitutes for the usual rotary pedal motion an approximately vertical pedal path. The frame is substantially like that of an ordinary tandem and to each end of the rear hanger shaft is pivoted a straight bar or link, which has a general horizontal position. To the front ends of these two links are pivoted triangular levers, the upper angles of which are connected to the ends of short cranks attached to the driving sprocket axle ends. The sprocket instead of being at the bottom of the frame is supported by a bracket hung about midway up the frame

and braced by three tubes running respectively to the front seat cluster, the rear hanger and the frame lug which takes the place of the usual front hanger. The pedals are attached to the lower corners of the triangular levers and have an up and down movement, the exact path of which is shown by the dotted lines in the illustration. It will be noticed that the path of the rear pedals is much shorter than that of the front. Without considering the question of the desirability of the vertical pedal movement or of the propriety in a tandem of a movement in which the rear rider's left foot is down when the front rider's left foot is up, it seems that the designer of this machine should have carried out his lever arrangement in such a way that both the front and rear strokes would be of the same length. The inventor is Edgar Courtwright, Tacoma, Wash.

**White's Pin Gearing.**—The front driving gear has a series of pins arranged around its inner face, the pins engaging rollers extending longitudinally but arranged in an annular set around the

front end of the driving shaft. The gear set at the rear end of the driving shaft is similar, the pinned wheel being on the hub of the rear wheel. The pins used are inclined slightly to correspond to the inclination of the driving shaft from a

right angle in its relation to the crank axle. The main features of the gear lie in the prolate spheroidal ends of the pins on the gears and the freely rotating rollers which they engage. The design of the parts is such that before a pin leaves its engaging roller the next pin has picked up the next roller. The inventor claims that as there are always two pins in engagement, the outward lateral pressure of one pin against the roller is counteracted by the inward lateral pressure of the adjoining pin against the adjoining roller. There will be then no tendency to rattling. The inventor is E. E. White, Oshkosh, Wis.

**Brennan's Flush Joint.**—The invention comprises a crank hanger flush joint, in which ample brazing surface is obtained. The barrel is merely a plain shell with holes for the passage of the frame tubes at their proper locations and angles. Inside of the shell is another barrel shorter and smaller than the exterior one and separated from it by out-turned flanges. The interior barrel has frame tube lugs similar to those on an ordinary outside joint hanger bracket. The tubes are inserted through the holes in the outside shell into the sockets or lugs on the inside barrel, their ends having been previously scarfed to conform to the curvature of the barrel. On one of the main

frame tubes a tongue is left to be bent and hooked around the lower corner of the adjoining tube after the two are in place before the brazing. The brazing may be done by running the spelter down around the tubes from the outside, thus obviating heating the metal hot enough to melt spelter loaded inside of the joints, as is required in brazing some forms of flush joints. The inventor is Patrick Brennan, Syracuse, N. Y.

**Changeable Driving Gear.**—In the rear hub and upon the stationary axle are placed two rotary sleeves, each of which extends nearly to the middle of the axle. At the adjacent ends of the sleeves are attached bevel gear wheels meshing with either one or a pair of duplicate bevel pinions mounted in a transverse frame spanning the axle and secured to the hub barrel by means of small screws. The sleeves are on ball bearings, both on the axle and within the hub barrel, and the left one has a spring cam locking

device operated by a small rod or wire running to some hand latch in convenient reach of the rider. The main feature of this locking device is a pair of blocks which by the movement of the cam may be put either in or out of engagement with the hub barrel, allowing the left sleeve to be locked in its relation to the hub, thus locking, through the medium of the intervening parts, the rear chain sprocket with the hub itself and causing the rear wheel to rotate with the same velocity as the rear sprocket. When the cam is held so that the locking blocks cannot engage the notches in the hub barrel, the left sleeve, with its bevel gear,

is caught by means of the operating latch so that it cannot revolve in any direction, and the right sleeve in revolving gives through the medium of its gear both a rotary and an orbital movement to the transverse gears. This orbital motion around the axle has just one-half the velocity of the right sleeve and gear, so that since it is transmitted to the hub barrel the rear wheel will now have but half the velocity of the rear sprocket. The principal advantages claimed for the gearing is that while the use of a differential gear of this sort is not new, this particular construction allows ready adjustment of the parts through the medium of the simple ball bearings and easy removal of parts from either end for cleaning, etc. The inventor is F. P. Snow, Lynn, Mass., assignor to the Stanton Mfg. Co., Boston.

**Cushion Forks.**—To furnish a frame cushioned against vertical jars yet rigid with long narrow vertical loops on which slide blocks to receive the wheel axle against lateral strains the lower ends of the front forks and rear stays are fitted ends. Between the block and the stop at the upper end of each loop is placed a spiral spring. The rear forks are not of tubing, but are each made of several bars of light spring steel, either flat or elliptical in section, and bolted together at several points. The forward end of each of

these laminated fork bars is brazed tight to the hanger, while the rear end is furnished with a lug bored to receive the axle end. The rear axle thus has a vertical cushioned movement in relation to the rear stays and carries the forks up or down with it, the latter not only bending

but bending in a springy manner which aids the action of the springs in the stays. The inventor is I. F. Randolph, Chicago.

**Lady's "Cantilever" Frame.**—The invention is an adaptation of the Pederson "cantilever" frame to the requirements of a lady's machine. The rear stays and the double seat mast clustering

at their upper ends form a sort of pyramid for the support of the saddle. The front forks, which are very similar to those on the regular Pederson frame, are in the form of a truss, the tubes of which are separated at the middle by a crown or bridge. At this point the lower steering connection is made. Double tubes running from the crank hanger to the top of the front fork truss hinge at the latter point, forming the upper steering connection. To brace the frame against shocks, long double tubes run from the lower steering connection lug to the rear end of the lugs of the frame. These tubes, except at their ends, are independent of any of the other frame tubes, thus enabling shocks and vibrations to be distributed along their entire length without being localized at any point. The handle bars are fastened to the fork truss frame. The inventor is N. F. Willatt, London.

**Bearing Adjustment.** — The bearing, whether it be in a hub or in a hanger, uses inverted cups. One cone is stationary on the axle, and the other, instead of being threaded, is bored with a central hole, accurately sized to fit the smooth turned surface of that end of the axle, forming a snug sliding fit. Extending inwardly from the opposite end of the shaft

from the sliding cone is an axle hole. Running transversely of this hole at a point just inside of the normal position of the adjusting cone is another hole in the form of an elongated oval or slot. A transverse pin fitting this slot has its ends secured in an annular ring sliding on the shaft and resting against the inner side of the adjusting cone. A rod

turned to fit the inside of the longitudinal hole in the axle presses at one end against the transverse pin and at the other against a threaded plug screwed into the outer end of the hole. When it is desired to take up wear or play in the bearing, this plug is screwed further in, pushing with it the long rod, which in turn presses the cross pin before it. The cross pin moves the annular ring and this pushes the cone along the axle toward its mating cup, thus tightening the bearing. When it is desired to loosen the bearing the plug is screwed outwardly and the pressure of the balls on the cones causes the reverse operation of the parts to take place. As there is nothing but the balls to confine the movement of the cone in one direction, it seems probable that were this bearing loosely adjusted it would run tight one instant and loose the next, thus causing a very uneven movement of the bearing. The inventor is G. W. Shamp, Buffalo, N. Y.

**Extra Hand Grip for Bars.**—With view to filling a want among riders using low handle bars for some means of obtaining a restful upright position occasionally this invention provides a pair of ring-shaped handles to each of which is secured a half round part of a clamp. The clamp part is provided with ears bored and tapped for the reception of binding screws. The other half of the clamp is

also fitted with corresponding ears. The circular grips are applied to the handle bar one on each side of the center, the clamping pieces binding it to the bar tube. The exact position of the grips may be shifted to suit the fancy of the rider. The inventor is G. T. Bowman, Philadelphia.

With almost unbroken regularity the metallic spring appears as a remedy for puncture evils and deflated tires. Two Canadian inventors, K. D. Sutherland and T. W. Mitchel, of Montreal, are the inventors of an inner tube for double tube tires, in which a metallic spiral spring coil covered inside and out with canvas is used to supplant the ordinary air tube. The spring tube may be used as a part of a new tire or may be substituted for the inner tube of a leaky double tube tire. In all such combinations of metal and rubber in the tread portion of tires it has been found that the metal wears through the rubber and canvas in a very short time.

A toe clip hinged to a plate screwed to the front side of the pedal and fitted with a projecting tongue at its lower corner so that the rider may place his foot well forward upon the pedal and by drawing it backward pull up the clip and catch his toe underneath it, is the recent invention of H. J. Condell, New York. The piece which secures the clip to the pedal is like an inverted L with the lower back end of the clip swung from its outer extrem-

ity. The operating catch is semi-circular in shape and projects through the open center of the L.

C. H. Thomas, of Cleveland, is the patentee of a roller pin driving gear in which the driving gear wheel has short transverse rollers arranged around its periphery in the same manner as the teeth on a spur gear. Ordinary rigid pins around the pinion engage these rollers. The back gear is made in the same manner with the exception that the pins are on the driving pinion and the rollers on the rear wheel pinion.

#### Remedy for Hard Puncture Compound.

Repairmen and riders have frequently been troubled by the hardening of puncture closing compounds inside of tires which have been "doctored." Occasionally the compound gathers in a hardened lump and not only ceases to perform its duty in the matter of closing punctures, but causes a decided bump every time that part of the tire strikes the ground. The remedy for such an ill is very simple, it having been found by experiment that almost, if not quite, every puncture compound on the market is soluble in water. If a small quantity of water is put through the valve into a tire in which the compound has collected in a lump and hardened, and the tire is then worked with the hands till the water has thoroughly mixed with the compound and dissolved it, the original freely flowing and puncture healing properties of the compound may be reobtained. From four to six tablespoonfuls of water is all that is necessary in the average case of this kind.

#### Exceeding the Discount Limit.

"Three per cent 10 days," means just what it says, and the purchaser ratifies the contract of sale of which this is an important part whenever he accepts the goods. He should, therefore, be as scrupulous to observe that part of the agreement as any other. The clause above quoted does not mean: "Send the money when you get ready and take off your discount." The amount of the discount or the delay beyond the date may be trifling, but the times through which we have been passing have been of the kind to demonstrate that it is trifles which make or mar business. As a fact, the aggregate of such trifles is a considerable amount. The practice of exceeding the discount limit on invoices is an indication of a desire to get the best of the house in little things that often proves a forerunner of worse to come.

#### Bicycle Quotations Desired.

Mr. Frank Grimley, of 264 Clarence street, Sydney, N. S. W., Australia, is desirous of communicating with American manufacturers of bicycles, materials, accessories and cycle making machines and tools, with a view to acting as the exclusive agent for firms making such goods, which will then be pushed throughout Australia and New Zealand. Quotations and samples of novelties are wanted. Goods will be handled for the manufacturer on his own account or will be purchased outright. Mr. Grimley's business is an old established one, having been founded in 1864, and he having dealt with American manufacturers in other lines of goods is able to offer first-class references in this country.

Rev. Matt Evans of Oshkosh, Wis., has resigned the pastorate of the Second Methodist church in order to develop his invention of an "automatic pantaloons guard for bicyclers."

## SUBJECTS OF GENERAL INTEREST

CUTTING LOOSE  
FROM THE  
JOBBER

In approving the policy of a well-known bicycle house which recently elected to cut loose from jobbers a contributor to the Iron Age says that one of the words that is made to do much duty in these latter days is "jobber." Once it meant something; today it is applied to all who do a wholesale business, and to many others who are more important in the business world as retailers than as wholesalers. The jobber, in the right meaning of the word, does not exist in this country today in the hardware branch of business, and is growing very scarce in any and all other branches.

The wholesale dealer who is exclusively wholesale, is becoming almost as scarce as the jobber, and one of the reasons for his existence is that he may assist the manufacturer to distribute goods. So long as he handles an article its control is not in the manufacturer's hands. So long as a retailer can buy of the wholesaler he does not concern himself as to the wishes of the manufacturer regarding the selling price; he will do as he pleases.

The makers of patent medicines have given a fair trial to a system by which they permitted their goods to be handled by jobbers who would agree not to sell the goods to any one who cut prices, but the department stores have been as well stocked as before, and demoralization in prices has continued, showing that just as long as there is a "middleman" between the maker and the retailer, just so long will prices be out of the maker's control.

Any retailer who will give even casual study to the policy of the bicycle firm in question must see that it is one which appeals to him, for it was thought out for his interest. He knows under this system that he is buying his goods at the bottom price; no competitor is getting one cent the advantage of him; he knows that the selling price is the same everywhere, and he will have confidence in his own prices. As men are human, there will be cases where some few retailers may cut, but those will be so few that no dealer need worry over them; they will work out their own cure.

COMPOSITION  
OF  
BABBITT METAL

About forty-five years ago an English mechanic of an experimental disposition found that the system of bearings then in common use in Europe—brasses—was frequently the cause of a great deal of trouble, as the brass, soon becoming smooth from wear and having no affinity for the lubricant, would shed it. A great inconvenience was also experienced on account of sending machinery to all parts of the world and having the bearings give out, thus compelling a cessation of all use of the machine until new brasses could be sent for and received by slow-going ships. To partially obviate this, the system began of furnishing duplicate bearings for the highest grade of the machines exported. This, however, was both troublesome and expensive. One English mechanic, Charles Babbitt, discovered that by leaving a recess in the bearings made of brass, and filling it with a mixture of four parts of copper, eight parts of antimony and twenty-four parts of tin, a composition that could be readily melted in a ladle, he secured a better wearing surface, and one which, in case of its becoming worn or melted out by reason of the lubricant becoming exhausted, could be easily replaced by anyone having

very slight knowledge. This metallic composition soon became known as "Babbitt metal."

It was impossible for the inventor of this metal to convince his contemporaries in Great Britain of the practicability of his plan, on account of their conservative ideas and reluctance to try experiments. Their fathers and grandfathers used brasses, and so would they. This was their argument. Finally, despairing of success in England, Babbitt came to the United States, where at that time brass bearings were also commonly used, and began selling shop rights for from \$50 to \$200 each for the use of his formula.

After his death, his secret became an open one, and a great many people began making "genuine Babbitt metal" for sale. This was in accordance with his formula, but the requirements of different carrying capacities, different speeds, etc., and the competition of the manufacturers of it, soon brought about adulterations of the metal by the use of lead and other cheap alloys. A series of letters or numbers was at one time adopted to designate the different qualities, but it was all still called "Babbitt metal," a misnomer, as there was never but one Babbitt metal, and that was the mixture the ingredients of which have been stated above.

UNPRECEDENTED  
TRADE  
ACTIVITY

The commercial activity of the United States at the present time is amazing not only the foreign countries which are the principal competitors of this country in the export trade, but is difficult of appreciation by even our own citizens, so rapid has been the change from the half indifference to the export trade, as exhibited up to ten years ago, to the present aggressive efforts to invade the uttermost markets of the world with the products and manufactures of the United States. From every source indicative of the volume of trade in the United States are derived statistics that tell the same gratifying story of unprecedented activity and expansion.

More business is being done now by the merchants and manufacturers of the United States than at any previous time in the history of the country. When the accounts for December are made up it will be found that the total volume of business for the month was bigger than that for any month of any other year, a fact clearly foreshadowed by the weekly review published by R. G. Dun & Co. last Saturday after only twenty-three days of the month had passed. The enthusiastic and cheerful tone of this report from such a prosaic source carries a subtle conviction with it which figures themselves can hardly increase. The report says:

It is a year beyond parallel and goes to its close with the biggest volume of business ever seen. Enormous transactions at the stock exchange make a difference, and heavy railroad earnings, but when all the transporting and speculative interests are eliminated there is still a much larger business than in any other month of any year. Last month the exports were in volume greater than in any previous month in the history of the country, but this month the three weeks' report shows an increase of 25 per cent against 9 per cent in imports, which would indicate much more than \$70,000,000 excess of exports for December. The payments through clearing houses have been for the week 26.5 per cent greater than last year and 12.4 per cent greater than in 1892, and for the month 17.8 per cent larger than in 1892. Until now no greater volume of business has ever been done in the history of this country than in the closing month of this year.

The exports of the country are vastly greater than they ever were before.

Though imports have increased remarkably, exports have increased so much faster that the balance of trade is running about \$75,000,000 a month in favor of the United States, a condition the results of which have already been seen in the efforts of foreign nations to borrow in the American money market.

The export trade of the United States is far greater than that of Great Britain.

The tonnage of vessels entering and leaving New York harbor is much beyond that in London harbor.

For the first time in the history of the world New York is able to dictate money rates to the London, Berlin and Paris bourses.

LIQUEFIED AIR  
AS A  
MOTOR FORCE

Prof. Charles E. Tripler of Brooklyn, who has been experimenting for some time with liquefied air with remarkable results, believes he now has perfected a means of handling it to make it of practical use. He says:

"I am happy to announce that, after years of experiment, my process for manufacturing liquefied air, cheaply and in large quantities, is not only successful but I have solved the problem of harnessing this great power to machinery. My engine for this purpose works, and it requires only the perfection of a few mechanical details to realize its enormous utility as a motor for all kinds of machinery—for railroad trains, steamships, factories; in short, wheresoever great force is required, from propelling navies to firing their guns and blowing up cities and forts.

"Liquid air is from twenty to one hundred times more powerful than steam, according to the amount of heat applied. Even with the heat of the surrounding atmosphere its expansive force is twenty times greater than steam."

The details of the motor he keeps secret.

TRADE CONDITIONS  
IN THE  
NORTHWEST

The business conditions in the northwest are steadily improving and the outlook for several years of good trade there is excellent. Wisconsin, Minnesota and the Dakotas are more prosperous than they have been for many years. Crops have been large and of good quality, the railroads have plenty of freight to haul both to and from the east, a large mortgage indebtedness has been paid, adjustments to meet existing conditions have been made and the outlook is decidedly encouraging. A large farm mortgage concern in Chicago, which controls loans amounting to more than \$9,000,000 in the corn belt, reports that out of \$609,985 interest payable on these loans in the last twelve months ending October 25, only \$5,802 is overdue more than ninety days or being collected by foreclosure. This is less than 1 per cent of the total interest and only 6-100th of 1 per cent of the principal outstanding.

A partnership has the same power over firm property that an individual has over his own property.

Calcium carbide is still unobtainable in Calcutta, according to the Indian Cyclist. A bill has been introduced in the viceroy's council amending the present petroleum act to make it applicable to explosive solids such as calcium carbide. There is said to be a great feature for calcium carbide in India.

## AUTOMOBILE REQUIREMENTS

### Judges of Recent Boston Contest Greatly Favor Motors Against Horse Traction.

In the report published by the Massachusetts Charitable Mechanics' Association of Boston relative to the recent contest between motor carriages at Charles River park, no recognition is given the Stanley steam wagon or any other vehicle which did not remain on exhibition after the contest. This was in accordance with the rules made known to the exhibitors in advance and therefore presents no grounds for complaint; but should nevertheless be kept in mind by those who are interested in motor vehicles and receive the report of the judges.

The judges of the contest were Isaac H. Davis, a member of the association under whose auspices the contest was held; Prof. Gaetano Lanza, of the Massachusetts Institute of Technology, and Charles H. Metz, president of the Waltham Mfg. Co.

The results of the contest have been fully reported in previous issues of *The Cycle Age*, but the judges of the event set forth the general considerations by which they were actuated in the awarding of prizes, and these are of interest by showing the requirements of motor vehicles with which it is considered most important that makers of such vehicles should comply. These considerations are as follows:

#### Speed and Range of Speed.

In the case of carriages intended for road use, and not for racing, a speed greater than about fifteen miles per hour is not needed; for in the case of country roads, the conditions of the roads would usually prevent a greater speed without injury to the vehicle and the rider; and in the case of city roads, faster riding would be against the law, on account of the danger to foot passengers. Great speed, therefore, would be needed only by carriages intended for racing. Nevertheless, the ability to increase the power exerted at times very much above the normal is a great desideratum, for it may be necessary to climb steep hills, and to maintain upon them a reasonable speed, and one considerably greater than can be maintained by the average horse and carriage. Indeed, the motor carriages should always be able to go faster than the horse-driven carriages, not only because they should expedite travel, but also because they can be better guided.

Range of speed and good control are very important matters. These are especially important when one finds a portion of the road so clear of other travel as to render possible and desirable a high speed, and another part so crowded as to render it necessary to creep along at a very slow and very variable speed, which may even at times become a negative quantity.

In steam carriages it is easy to accomplish this result by throttling the steam more or less as may be needed. In the electric carriages the method of accomplishing this result is usually as follows: The carriages have usually three or four forward and two or three backward speeds produced by setting the controlling mechanism at certain definite positions; then when a speed is needed intermediate between any two of these, the result is obtained by setting the controlling mechanism in the position corresponding to one of them, and then, after moving with this speed a part of the distance, changing to the other. When we take note of the fact that it requires a little (though short) time to develop any one speed, it will be evident that this method gives the driver a very perfect control of his vehicle. Of course the brake may be used in both as an additional auxiliary when necessary. It should be added that those that cannot reverse are at some disadvantage when in a very great crowd of heavy and slow-going teams, or in a blockade; nevertheless in cases where they can turn in their own width this difficulty is less than where they cannot.

These remarks apply also to gasoline carriages, as they are usually built with ranges of speed that give them a good control.

By this is meant that the carriage should be easily turned, quickly started and quickly stopped, and easily guided where the room

is small, as in a crowd of vehicles or in a very narrow street; also in cases where it is necessary to turn quickly, to turn in a small space, or to reverse or go ahead at any speed, these things can be readily done. All this is very necessary in order that obstacles, whether at rest or in motion, may be easily and quickly avoided. It should be observed, however, that all the motor carriages exhibited are decidedly more manageable than a horse and carriage, besides occupying less room, and that the operator guiding the motor carriage knows just what it will do, with far greater certainty than the driver of a horse and carriage knows what his horse will do.

#### Simplicity and Durability.

The special importance of simplicity is that the machinery may not easily be gotten out of order on account of a multiplicity of the parts, or from a need of too delicate adjustment, that the services of a skilled mechanic may not be needed to drive it, and that ordinary repairs may be made as easily as possible, and by the use of such tools only as can be easily carried on the vehicle.

In order to secure durability none of the parts should be so proportioned as to wear out quickly. But in order to be sure of the durability, it is necessary to observe the wear of the carriage during a long period of service, and while it would be easy to condemn features that evidently showed weakness by an inspection of the new carriage, it would need a long trial to pronounce positively that any carriage is very durable.

#### Appearance and Design.

When motor carriages become common, there will be use for those which, though well adapted to their purpose, are not especially handsome. Thus it would not be suitable to have in a delivery wagon the richness and beauty desirable in a pleasure carriage; nevertheless, in all cases neatness and elegance of design are important.

#### Comfort and Cost of Operation.

The motor carriage should be fully as comfortable as those now in use, and not jar the rider excessively.

The cost of operation is, in the case of all the carriages exhibited, so very small an item that it would hardly have any influence upon the user of a motor carriage in deciding which to purchase; it is not in any way to be compared to the cost of keeping a horse. The cost is, in practically all the cases, less than two cents per mile on ordinary roads.

#### Climbing of Grades.

The carriages should be able to overcome as steep, or even somewhat steeper, hills than horses can climb, and to maintain a greater speed than a horse. A severe test of a motor carriage is to have it start from rest on a steep grade, in which case the capability of a motor to bear a very considerable excess of load temporarily is a great help.

#### Description of De Dion Vehicles.

The quadricycle is provided with two seats, the rear seat being a saddle occupied by the driver of the machine, and the forward one being a seat occupied by another rider. These machines have to be started by means of the pedals, which cease to act as soon as the motor begins to operate. The gasoline is contained in the bottom of a combined tank and carburetter; a current of air, whose quantity is regulated, is caused to flow over the surface of the gasoline, and thus becomes charged with gasoline vapor. The mixture of air and gasoline then passes through the mixing valve at the top of the tank, where it unites with a quantity of air sufficient to make the proper explosive mixture. From here it passes through a pipe into the cylinder, where it is exploded by an electric spark.

The engine is single acting, and the cylinder is provided, on the outside, with a series of projecting rings, the object of these being to present a large surface to the air for the purpose of cooling the cylinder, as this arrangement renders it unnecessary to carry cooling water. The engine is vertical, and the crank pin is set in two discs which perform, to some extent, the functions of a fly wheel. The discs are enclosed in a flat cylindrical box made of aluminum. The lower part of this box contains oil, into which the crank pin dips at each revolution. This engine drives the rear axle by a train of gears, this axle being made in two parts connected by a differential train of spur gears, which allow the two rear wheels to

turn at different rates of speed in going around curves.

The steering is done by means of the handlebars in the ordinary way. In the case of the quadricycle the forward axle is fixed relatively to the carriage, and the axle of the front wheels is mounted at the ends of the fixed axle by means of vertical pivots, and the steering gear is so designed as to cause the two front wheels to turn through different angles to the carriage when going around curves. Ball bearings are used throughout the running gear. The weight of the tricycle is said to be about 175 pounds, and that of the quadricycle about 275 pounds.

The report of the judges comprises a description in general terms of each of the exhibited vehicles. Of these, only the Eaton electric Stanhope, which is still in an experimental stage, and the De Dion & Bouton vehicles have not been previously described in this paper. De Dion, Bouton & Co., of Paris, exhibited one gasoline tricycle and one gasoline quadricycle, which are described as follows:

The charge of air and gas in the cylinder is exploded by an electric spark, which can be caused to occur at any portion of the stroke desired. Thus if a high speed is desired this spark would be made to occur near the beginning of the stroke, and if a slow speed is desired, near the end of the stroke. The batteries for the spark apparatus are contained in a metal box hung from the upper bar of the machine, an induction coil is hung on the rear axle, and to the valve-operating gear is attached a circuit-breaker of special design. By suitably adjusting the position of this circuit-breaker by means of a handle, the spark is caused to occur at any portion of the stroke desired. It will be evident, therefore, that any speed above a certain minimum, which they state to be about four miles per hour, can be obtained. For lower speeds, the machine has to be driven by the pedals, and, in starting, the pedals are used until the motor commences to work properly. The switch of the igniter is in the handle of one of the handlebars. In going in a crowded city street, if the speed required is too low for the motor to work, the pedals are used.

These machines, on account of their lightness, would naturally be preferred to the heavier carriages by any one who desired a substitute for the bicycle, rather than the comfort and roominess which can be obtained only with greater weight. They can, if anything gets out of order, be driven by means of the pedals. The tricycle can be easily guided, having only one wheel in front; and also, on account of the small wheel base, it can be turned around in a very small space, and this partly offsets the disadvantage of not being able to reverse and back.

The machine is capable of a very considerable speed, and the whole idea is very ingenious and well calculated for use when a light and small vehicle is desired.

#### Compressed Air Stage Service.

A Chicago syndicate composed of George M. Milligan, George Atkins and J. M. Thompson is preparing to organize a parent company in Chicago and local companies in New York, Brooklyn, Philadelphia, Boston, Baltimore, and Washington, for the purpose of establishing in these cities lines of compressed air motor cars or omnibuses shod with pneumatic tires. The ultimate intention is to put such service into all cities of more than 70,000 which have suitable streets for the use of pneumatic tires, the object being to cater to the short haul traffic of three to five miles at a fare of 5 cents. It is expected that the lines in a few of these cities will be in operation by July 1 next year. The parent company is to be capitalized for \$3,000,000 to \$4,000,000, and it is estimated that the local companies will involve a total capitalization of \$50,000,000 or \$60,000,000.

#### More Capital for London Cab Service.

At an ordinary general meeting of the London Electrical Cab company, Ltd., held early this month, a loss of \$13,039 was announced. It was stated that \$60,000 in 5 per cent. debentures would shortly be asked for, which, with the last call, would be sufficient to pay all liabilities and provide additional working capital. It was announced that all of the cabs would be working by the middle of next month.

## MOTOR VEHICLES VS. HORSES

### Defense of the Gas Engine Vehicle in Its Present Form— An Answer to Dolnar

To the Editor.—The article by Hugh Dolnar on the condition of the motor cycle problem in your last issue calls for a protest. The writer has given the motor vehicle problem as much time and attention as any one in this country, and is thoroughly acquainted with their defects as well as their good qualities. The writer of the article in question tells the truth regarding gasoline motor vehicles, but he does not set that truth in the proper relation to the present state of civilization. It is a well known fact that no mechanical vehicle is perfect, and no reasonable being expects perfection this side of eternity in anything.

The question before the American public is not whether these vehicles are perfect, but whether they are sufficiently near perfection to be reasonably practical, or, to be more explicit, whether they are able to give a better service at less cost than does a horse. There is no denying that so far as it goes electricity is an ideal driving method, but its limitations are such that it is not as good as the ordinary horse for ordinary purposes. This being true, it is not likely that the American public will adopt same to any great extent, for they require better servants each year rather than worse ones. For short pleasure drives on fine streets it is possible that the electric vehicle will have a field, but the constant uncertainty of being able to get back without the assistance of a team will destroy much of the pleasure of using, even though clean, silent, and otherwise satisfactory.

#### The Commonly Used Motor.

Before deciding to take up the gasoline motor for vehicle propulsion, the writer gave the electric motor much attention, but did not then, and does not yet, see sufficient future to the electric motor to warrant its adoption. It is not the purpose of this article to criticize the electric motor. Within its very limited range, too limited for an extended private use, it is everything claimed by your correspondent. On the gasoline vehicle, however, is where he makes his error. He says first, "that the American public will never accept explosion engine wagons so long as they are dirty and deliver vile odors in abundance." This statement indicates that he is not acquainted with the best examples of explosion engine vehicles, or else that he does not realize how dirty and filthy is the present commonly used motor, the horse. The public of today drive behind horses without complaint, and it is certain that any motor, although not perfect, which offers advantages over the horse, will be adopted. This is the true gist of the matter.

#### Public Expects Too Much.

The explosion engine vehicle can do more miles per hour, more hours per day, at less cost and with less care than can the horse; while its objectionable features are not to be compared with the objectionable features of the horse. This is the situation of the problem to-day and I fully agree with your correspondent that the proper thing to do is to recognize it both in factory and in print. On the other side of the water where feeding and horse flesh cost more the motor vehicle is taking with a rush, indicating

that the people will accept its faults because of its advantages. Here, where horses are plenty and easily maintained, they may not be willing to accept quite so imperfect a machine as on the other side, but, like over there, they certainly will accept any machine which meets their needs at less cost and with less objections than the horse. It should be the part, however, of the press to properly state this matter before the public that no false ideas may be entertained. Few inventions have ever been criticised with the same degree of fastidiousness as is the motor vehicle. People expect a horse carriage, without the horse, to be propelled by a small motor concealed in the limited amount of space under the ordinary carriage seat, and operated by a push button. They regard the much advertised electricity as the proper and only solution of the problem, and waste their time and money hoping for and buying something they cannot get or do not want in that line. When they fully understand the facts they will be willing to accept the conditions as they are, and this result will be beneficial both to the manufacturers and the users.

#### Demand for Gasoline Vehicles.

We have sold explosion vehicles to owners of electric ones, and we have on our books to-day unfilled orders months ahead of our capacity. Your correspondent asked for evidence of the acceptance of gasoline vehicles. If he had charge of our correspondence for a few weeks, we are confident he would cry "enough." All Duryea wagons so far built, with the exception of the samples in use, which are not for sale, have been sold. While it is true that they are not in evidence in every village in the country, this fact has been caused by the preference to further develop, rather than sell what was already produced. This policy, however, was the direct result of the mistaken notion of the public that perfect vehicles could be had. The final solution of the problem will be that some one or more makers will turn out such vehicles as they have, will sell them as fast as turned out, as is quite evidently possible from our own experience, and will educate the public to the fact that, although better and less objectionable than the horse, they are not "airy, fairy nor ideal."

#### Noiseless on the Street.

Your correspondent makes the statement that "there is no such thing on the market as a clean, silent and inexpensive motor vehicle of unlimited range." The writer has used both our own and foreign makes of vehicles, has "paced" cyclers for miles, and has been assured by them that no disagreeable trail of odor was left behind. It is a matter of absolute certainty that no odor reaches the occupant of the carriage in ordinary driving, for the motion forward brings fresh air only to the drivers. Such testimony as this should forever settle the "offensive" argument. We are often in receipt of testimony to the effect that, although standing on the sidewalk, the observer was not able to hear the vehicle as it passed down the street, and we have very often proved, by comparative tests, that our motor vehicle cannot be heard as far up the street as the horse vehicle. It

would seem that this should settle the "noise" objection.

In the matter of cleanliness, we consider that there is no comparison between caring for the horse and operating same, and caring for a motor vehicle. The fault here is that horse drivers find the horse so offensive that they have same taken care of at livery stables or by some one hired for the purpose, while motor vehicle users, imagining that all they need to do is, as before stated, "push a button," undertake to do same themselves, and find more or less inconvenience attending. Our men have been accustomed to horses from infancy up, and can therefore perfectly compare the trouble and nuisance of both systems and, while we give the motor vehicle the necessary attention required generally without removing cuffs, we do know that to properly care for the horse requires a change of clothes. This argument also cannot be denied, and should be a sufficient answer to the question of cleanliness.

#### Cheap Vehicles of the Future.

Your correspondent further called attention to the fact that foreign vehicles have not sold readily on the American market. This is undoubtedly true, and its reason is not far to seek. They are built in a much inferior manner, and have not the elegance of design nor the simplicity of construction shown on this side of the water. It is common to suppose that the foreigners lead us in the matter of motor vehicles, but this is far from the truth. American inventors have maintained their reputation on this side, and the best vehicles, as demonstrated, when tried in competition, have been produced in the United States. There has been, however, a decided lack of interest in this matter shown by the press, the capitalists and the general public. This is a matter for which the press is largely to blame, and which, as your correspondent suggests, cannot be remedied better than by placing the situation accurately before the public.

#### Present Vehicles Practical.

The motor vehicle is no 10-cent affair, and cannot be built in a hall bedroom. It is to all intents and purposes a locomotive and, while it has been greatly simplified, it is still an article requiring a large investment of capital to properly produce. The cheap motor vehicle which shall carry passengers with comfort is a thing of the quite distant future. The writer well remembers when in the early '80s people refused to buy \$100 bicycles because "next year they could buy them for \$25," but they waited more than fifteen years to see the fulfillment of their prophecy, and the same will be largely true of the motor vehicle. When such companies as the Pope company, with more than three years' expenditure of time, and thousands of dollars in money, are not able to turn out vehicles in large quantities at low prices, it certainly should be evident to the public that the cheap, silent, inoffensive, push-button affair, which they so confidently expect, cannot be had. If they will then turn their attention to what they are now using and be willing to accept something lighter, cleaner, safer, faster, less noisy, not filthy or unsanitary, higher in price, but cheaper to maintain, they will find that such an article can be had.

CHAS. E. DURYEY.

Electric motor cabs from Paris are to be put in operation on Fifth avenue, New York, to supplant the old stage coaches now running. The coach line has been purchased by three stockholders of the Third avenue street car line and the change will soon be made.

# INFORMATION FOR BUYERS

## THE NEW DEPARTURE ACETYLENE LAMP.

A bicycle lamp that is radically different from any other at present on the market in America is the New Departure here shown. It is being introduced by the Joseph Lucas & Son company, Bristol, Conn., for whom John H. Graham & Co., 113 Chambers street, New York, are selling agents. The lamp is virtually in two parts. The water and car-

bide chambers are contained in a cylindrical tube 7½ inches long by 2 inches diameter, tinned on the inside and divided by a metal diaphragm in the middle. The milled cap at the lower end is removable and the carbide cylinder can be removed and refilled when the charge is exhausted. A perforated metallic cap covers the carbide and a coil spring keeps it pressed down and prevents the carbide from rattling while allowing it to expand under the action of the water. The upper half of the main cylinder contains the water which is admitted to the carbide through a tube containing the worsted wick, the flow being regulated by the small lever shown below the filling cap at the top. The combustion chamber or hood is supported at the top of the gas tube adjustably connected at the side of the reservoir so that the light can be thrown at any desired angle. The hood contains a parabolic reflector and a 2¾-inch lens. The burner is made of lava and produces a fish-tail flame giving a strong light. The tubular generator is enameled in any color to match the machine or is finished in nickel plating, and attaches to the lower frame tube by means of spring clamps, one of which has a thumbpiece for binding it firmly in place. The hood of the lamp is fully nicked and presents a neat and attractive appearance. The weight of the entire lamp is sixteen ounces.

## RATHBUN ECCENTRIC CHAIN ADJUSTER.

The Rathbun Mfg. Co., 130 Second street, Milwaukee, is making a three-piece rear fork end and chain adjuster which furnishes a neat positive adjustment for the chain and a clean-cut finish for the rear end of the frame. The rear fork and stay connection plate is made with the round hole in the

rear end, a slot leading to the hole permitting the entrance of the rear axle. A circular plate with an exterior flange fits in the round hole in the frame fitting and receives the axle in an eccentrically located hole. A plain round plate or washer lies against the inside of the fitting and is made to move in unison with the outside adjusting plate by means of a small hole and pin. The flange on the outside plate is knurled so that the

eccentric adjuster can be turned with the fingers. The swing of the eccentric is sufficient to take up an entire link of chain slack. The eccentric washers are made to take ⅜-inch axles and the frame connection piece is supplied with either round or D ferrules for ¼ or ⅝-inch fork tubes.

## PFLUEGER'S CHAIN LUBRICANTS.

Two kinds of chain lubricant, one "snow white" and the other "ebony black," are made by the Enterprise Mfg. Co., of Akron, O. Pflueger's Snow-flake lubricant is composed entirely of white lubricating materials and will not soil hands or clothing. It is also perfumed with an agreeable odor which is lasting and lends an item of charm to the commonplace task of greasing a cycle chain. The Ebony Black lubricant is suitable to all climates and is not affected by changes of weather. It has good lasting qualities and will not gum the chain nor collect dirt. The lubricants are put up in three sizes of packages, and will be sent either wrapped in heavy silver foil and mounted one dozen on a counter display card, or will be wrapped in foil and each stick inclosed in a wood telescopic box. On orders of generous size the lubricant will be put up under special label at no extra expense to the purchaser.

## MILLER & CO.'S "MAJESTIC" GAS LAMP.

Edward Miller & Co., of Meriden, Conn., have added to their line of bicycle lamps for this season the acetylene gas lamp here shown in cross section. The water reservoir is a flattened spheroid interposed between the gas chamber and the combustion chamber and is filled through a circular opening at the side closed with a screw cap after the manner of many kerosene lamps. The water feed tube passes through the center of the water reservoir and depends into the gas chamber almost to the bottom thereof, and is provided at the lower end with a needle valve operated by a finger lever at

the back of the water reservoir. There is no wick or fibrous material of any kind for feeding the water to the carbide, but the water drops into a central metallic split tube in the carbide box which acts as a distributor. A fish tail burner is used. Special features of the Majestic are the front reflector, which is a section of a perfect parabola; the back reflector, which is hinged to the body of the lamp and gives free access to the inside of the combustion chamber for lighting as well as for cleaning; and the carbide cylinder, which is made of two telescoping parts closed at top and bottom and designed for the use of regular commercial calcium carbide. The lower part of this cylinder is permanently attached to the removable bottom that closes the gas chamber air tight by means of a rubber gasket, and the top part, which must be lowered to be filled, is marked with four divisions showing the amount of carbide necessary for from one to four hours' use of the lamp. An adjustable hanger or bracket to fit either the head or forkside of the bicycle is provided, but the makers strongly recommend that the lamp be attached to the head as in that position the road is better illuminated and the lamp is where it can be easily reached by the rider and its flow of water to the carbide better controlled.

## NEW WEBB HANDLE BAR.

The Sanford & Pollow Co., 235 Lake street, Chicago, who manufacture the Webb handlebar and seat post expander, have lately

placed in the market an adjustable bar also made under Webb patents. The new Webb bar is adjustable without the use of any tools or wrenches and the position of the grips can be altered while riding. As will be noticed in the illustration, a sleeve with taper ends is fastened to the central part of the bar tube. One taper end of the sleeve is radially serrated to match the serrations on the interior taper at one end of the hollow stem head or tee piece. The opposite end of this tee piece is externally threaded and takes a knurled hand nut internally threaded to match and also containing a split bushing internally tapered to correspond to the smooth tapered end of the central sleeve on the bar. The manner of assembling the parts is obvious. When the nut has been screwed tight on to the tee the split bushing is wedged securely against

the taper seat on the bar and the parts are securely locked together. The bars are made in popular shapes and as the adjustment parts are small and compact the appearance is neat and attractive.

## HIGH PRESSURE BRAZING FORGE NO. 2.

In the No. 2 High Pressure brazing forge made by the National Cement & Rubber Mfg. Co. of Toledo, O., the trade will notice many valuable improvements over the High Pressure forge manufactured by this company during 1898, which was remarkably successful. The No. 2 was designed to fill the increasing demand for a brazer that would do all classes of work, such as light and heavy brazing, tempering, welding, melting of metals, etc. It is fitted with the company's improved hydrocarbon adjustable burners and with a heavy cast iron tray supported by a substantial standard. The tank is galvanized iron, tested to 150 pounds pressure, the pipe is extra heavy, and all the joints are tee joints, so located that by removing the plug from the tee any portion of the pipe can be readily cleaned by inserting a wire. The lower burner is so constructed this season that it can be swung entirely clear from beneath the pan, yet when in operation is midway between the two burners but not directly under the melting spelter, and thus prevents the danger of filling up from this cause. Filling the cast iron tray with coke and applying the center burner makes it possible to produce a complete blacksmith's forge, and by the use of the other two burners at the same time, the heat is intense enough to melt brass in crucibles. The company is furnishing with each brazing forge this season a 100 pounds pressure gauge, floor pump, and full directions how to operate.

## DRILLS FOR FACTORY AND REPAIR SHOP.

The Silver Mfg. Co., of Salem, O., has a line of drills running from small hand power post drills to 20-inch swing power drill presses, both the requirements of the small

repair and machine shop of the factory being met in the line of machines. The Advance drill No. 12, which is made for both hand and belt power, is well adapted to the purposes of a cycle repair shop. It is simple and durable but still permits of accurate drilling and reaming. This hand power ma-

chine, here illustrated, has two speeds and self feed. The spindle is one inch and has a vertical movement or run of 3 inches. The greatest distance of the table from the spindle is 14½ inches and drilling to the center of work as large as 15 inches in diameter is possible. The machine will carry

drills up to 1¼ inches and as regularly fitted takes drills with half-inch round shanks. It weighs 125 pounds. Other grades, sizes and patterns of post and bench drills for hand or belt power are also catalogued by the company, all being designed for light accurate drilling for which more expensive machines are generally purchased. For more extensive drilling operations, as those in a large machine shop or factory, two patterns of 20-inch swing drill presses are listed, one of which is shown. It has a square base and a combination lever and screw feed so constructed that either can be used without interfering with the other. The spindle is bored to No. 2 Morse taper and has a vertical travel of 7½ inches. The weight of the machine is 525 pounds.

**U. S. MFG. CO.'S PEDAL FOR LADIES.**

The accompanying illustration shows the design and distinctive features of the Crescent No. 3 pedal now being manufactured for next year's trade by the U. S. Mfg. Co. of Fond du Lac, Wis. This pedal is a combination of the No. 1 and No. 3 Crescent pedals for men, and is for use on ladies' and

juvenile machines. It weighs only twelve ounces per pair in rat trap or fifteen ounces with rubber treads or Straus universal rubbers. These pedals, like the U. S. cyclometers, lamp brackets, etc., are made of the best material and workmanship and are fully guaranteed. The finish is polished nickel on copper.

**THE "FAVORITE" MEN'S MODEL.**

In branching out from the manufacture of juvenile bicycles and placing on the market adult machines, the Toledo Metal Wheel Co., of Toledo, avoids following fads but

aims at the production of up-to-date, high grade bicycles to be sold at moderate prices. The adult drop-frame Favorite, Model 15, has all of the exterior requirements of a stylish machine and is honestly and con-

servatively made, it being offered as a bicycle to stand the test of hard usage and to meet the commercial requirements of '99. The frame is built either with 22 or 24-inch seat mast, has flush joints, arch crown, D-shape rear forks, expander bar and seat post fittings, Fauber pattern one-piece crank hanger and other popular fittings. The finish is black or maroon, decorated, with the further option if desired of light blue. Kelly adjustable or plain drop handlebars are offered and several options in tires are granted. The machine weighs 24 pounds and lists at \$50.

**CLARK NOVELTY CO.'S SPECIALTIES.**

The Clark Novelty Co., of Rochester, N. Y., instead of being incorporated for \$11,000 capital stock, as previously stated, is beginning the production of bicycle specialties and undertaking the manufacture of brass and metal goods of special nature with a capitalization of \$50,000, \$40,000 of which has been subscribed for and paid in full. Two of the bicycle specialties that the company is now marketing are the Clark automatic valve and the Clark rotary bicycle alarm. The valve consists of only three parts, has no springs and no pins and is easy to pump. It is made in both plain and metal base styles, with cap and inside part interchangeable. It has been in the market for the past four years. The rotary bell attaches to the front forkside and has the double clapper fastened to the end of a shaft rotated by a small rubber pulley at the other end which is raised by a silk cord into contact with the under side of the wheel rim, causing it to sound continuously until the tension of the cord is released.

**THE "HANDY" BICYCLE SUPPORT.**

The illustration shows a light, simple cycle support which is made by the inventor and patentee, William H. Hart, Jr., 242 Chestnut

street, Philadelphia. The support is made from a light piece of spring wire with a small attaching piece by means of which the support may be screwed to the outer end of the pedal. When not in use it folds up against the under side of the pedal and is held against accidental loosening by the spring clip which catches the barrel of the pedal. With a little practice a rider can pull the support down into supporting position or pick it up out of the way with the foot. The only alteration required on the bicycle to which it is to be fitted is the drilling of a small hole in one of the outer ears of the pedal. When folded up it is practically invisible and as it weighs but 2½ ounces is not to be included among cumbersome accessories.

**EARLY SHIPMENTS IN CARLOAD LOTS.**

A feature of this season's trade that offers sufficient ground for the prediction that 1899 will be the best year ever experienced in the bicycle industry is the actual shipments being made at this early date of carload lots of machines to agents. The Shelby Cycle Mfg. Co., of Shelby, O., furnishes two examples of this in its recent shipments of a lot of 670 Ideal bicycles in two cars to two Pacific coast agencies and a single lot of five carloads of Ideals, sold on actual orders from agents, for immediate delivery.

**THE DIETZ OIL LAMP.**

The Dietz lamp, though made on the same general outlines as in the past, has been improved in several particulars for the coming season and is offered by its makers, R. E. Dietz Co., 60 Laight street, New York, as the representative summing up of the knowledge gained in fifty years of lamp building. It is made entirely of brass and weighs but twelve ounces. No solder is used except on the bottom of the oil fount. Careful attention has been paid to the arrangement of the drafts in order to secure good combustion and to obtain an intense white flame. The reflector, which is of the parabolic type, throws all of the light ahead and is readily removable for cleaning. The oil

fount is packed to prevent the oil from working out. While green and red side lights are provided as usual, there are no slides on the sides, the reflector instead being hinged so that the lamp may be easily lighted from the front. Experience has taught the makers that a large part of

the tarnishing of reflectors is due to the combustion of the match when lamps are lighted from the side. The lamp burns ten hours without refilling.

**CLEVELANDS HAVE A NEW BEARING.**

The latest result of the enterprise of Superintendent Burwell, of H. A. Lozier & Co., of Cleveland, in bringing out new mechanical features for Cleveland bicycles is a combination roller and ball bearing. As shown in the drawing, the balls carry the strain between the cup and cone as usual, while the rollers act as separators for the balls, keeping them from rubbing against one another, but allowing them to impart their rolling motion to the intervening rollers, such sliding friction as is commonly caused between adjoining balls being obviated by the reverse rolling movement of the rollers. As a practical test of the efficacy of the bearing, it has been fitted to a cup and cone grinding machine carrying a grinding wheel which formerly rotated at a speed of 13,000 revolutions per minute and

which since the fitting of the new bearing has been revolved at a speed of 33,000 to 35,000 revolutions per minute and has been kept running at that speed for several weeks without any perceptible wear on the bearing. The grinder traveling at the rate of speed mentioned, would, in a working day of ten hours, travel a distance equal to 1,041 miles if rolling on a plane surface. Other improvements have been made throughout the '99 machines. The steering head has been increased in diameter, allow-

ing the ball cases to be entirely incased by the tube, the head being straight and flush from end to end. The new handlebar expander obviates the necessity of hammering on the bars to loosen the fastening, a

turn of the expander nut releasing the expander and leaving the bar free for re-adjustment or removal. The same device is fitted to the seatpost. The new spoke terminates at the hub end in a ball about a quarter of an inch in diameter and which

has a shorter extension not in line with the spoke itself. As long as the spoke is tangent to the hub barrel it cannot pull out, but when it is turned so that it is at right

Model 61—Men's roadster. Price, \$50.

Model 62—Women's roadster. Price, \$50.

Model 64—Men's special light roadster. Price, \$75.

Model 65—Women's special light roadster. Price, \$75.

Model 67—Women's regular roadster. Price, \$75.

angles to the hub it can be easily slipped in or out of place. The balls on the ends of the spokes are pressed under heavy pressure on to threads on the spokes and cannot become loosened. The Cleveland bicycles for '99 will be regularly fitted with the Burwell detachable tire. Being mechanically se-

cured it does not depend upon the inflation for its fastening. The crank hanger is similar to that used in 1898 with several slight constructive changes for the better. The regular line of Cleveland models, the leading machines of which are illustrated, includes men's and women's road models, 61 and 62, listing at \$50; men's and women's 66 and 67, at \$75; racer, Model 68, at \$75; men's and women's regular road models,

66 and 67, at \$75; racer, model, 68, at \$75; men's 30-inch wheeled roadster, Model 69, at \$85; racing tandem, Model 70, at \$100, and the combination tandem, Model 72, at \$100. The racer weighs only 19 pounds, but its frame has been increased one pound in weight over the racer frame of '98 and stiff-

fened and strengthened in proportion. The weight reduction has been obtained in the fittings and equipment. A notable feature of the Model 66 is the fork stem, which is threaded at its lower end and then screwed into the crown forging and brazed fast.

ONE-PIECE AXLE LATHE.

The turning or finishing up of the forgings for one-piece crank and axle parts or other axles which cannot be hung between end centers but must be chucked in the middle is work which has caused W. H. Fauber, maker of the Fauber hanger, to produce the machine tool here illustrated. The machine is a simple lathe specially made for the work mentioned, though it may be adapted to any form of axle turning where any but middle chucking is impossible. Secured in the frame of the lathe is an inverted U shaped plate or frame with an annular ridge run-

ning around its inside face. This ridge is matched by a similar ridge formed in a segmental plate fastened to the bed of the machine in such a manner that the two plates and their inner annular ridges form a circular way for a large toothed disk in the center of whose periphery is a depression co-operating with the ridges mentioned. The disk has cross ribs as shown in the illustration, between the main two of which a pair of blocks are arranged to slide, their movement being governed by a double threaded screw passing down through

threaded holes in the blocks. The blocks have on their adjacent ends semicircular jaws which form the chucking pieces for the crank axle to be turned. The disk then corresponds to the live center or chuck of an ordinary lathe and is rotated by means of its

toothed circumference which engages a spur gear on the shaft of the driving pulley of the lathe. The minor pair of ribs across the rotating disk carry a block which may be made to engage by means of grooves cut in its inner end, the annular grooves around the central portion of the jaw adjusting screw, thus locking the jaws in place after they have gripped the axle to be turned. The adjusting screw is operated by a key inserted through a hole in the top of the frame work. The right end cutting tool is in segmental form and as shown in the middle illustration is held in a segmental ring fitting in a hole in the tool carriage plate. The angle of the tool is adjusted by a small set screw and after adjustment it is locked by a screw which tends to bind together the upper and lower parts of the horizontally split tool carriage plate. The left end cutter is shown in the lowest illustration. It is a straight horizontal cutting tool and moves in a slot between the two parts of the left

tool holding plate. It is tightened in a manner similar to the right end cutter and its angle is open to adjustment by means of the semicircular disk on which it rests. This tool carrying plate is adjusted in its relation to the right tool carriage by a set of screws on the front of the lathe. The entire tool carriage is fed inward or outward by a hand screw, also on the front of the machine, and to avoid feeding in too far and to insure uniformity of work, a set screw is mounted in the front block of the frame so that it will come in contact with the inverted U shaped frame and prevent any further movement of the tool carriage in relation to the work holding parts after the desired limit has been reached.

LIBERTY MODELS TO SUIT ALL.

The Liberty Cycle Co., of Bridgeport, Conn., has placed the '99 price for all its road models at \$50 and has designed patterns to suit the varying demands of scorchers, pleasure riders and racing men. Models 61 and 73, respectively the leading diamond and drop frame machines of the line, are built in three heights of frame with

Model 61—Men's roadster. Price, \$50.

flush joints throughout, tapered D-shaped rear forks, arch or square fork crown as desired and are finished in black, dark blue or dark green with rims in natural wood finish or enameled to match the frame. On Model 61, as well as on the "Bogie man" track racer, which lists at \$60, the top frame

# Plain Talks on Andrae Cycles

ANDRAE  
CYCLES  
NEVER  
DISAPPOINT

... II ...

Good, sound, deep thoughts are business helpers.

Suppose you think a bit.

Think over last year's business. In what were you weak? Why did competitors get some trade which ought to have been yours?

Tastes differ. So do pocket-books. You must have a wheel to suit any taste, to match any pocket-book.

We know of no other line of bicycles which will do this as easily, quickly, as the Andrae line.

No matter what price one wants to pay, you can sell him an Andrae that will be better than any other wheel at the same price.

The Andrae line consists of 14 Models, at \$30 up. The higher the price the better the quality, but Andrae workmanship in all.

The Andrae line is bound to make you money. If you get our price you will think so, too.

Mention The Cycle Age

tube is made 22½ inches long, thus allowing the scorcher to assume a stooping position without having to cramp his body, as is necessary on a shorter frame. Model 70 is a conservative model for gentlemen and has only 1½ inches drop to the hanger instead of the 3-inch drop on the other patterns and the top bar of the frame is two inches shorter in order to permit a graceful upright position for those riders who do not favor the hump. The medium length top bar is also a feature of Model 67, which, however,

Model 73—Women's roadster. Price, \$50.

Model 64—Track racer. Price, \$60.

has a 3-inch drop to the hanger in order to meet the requirements of riders who wish to have a low rakish machine but who do not care to assume the scorching position. In thus making road models in three types of frames the Liberty company is able to suit the exact desires of all classes of riders and does not compel the scorcher to ride a machine which with the exception of the depth of the handlebars is suitable for the elderly cyclist, and vice versa. A double diamond tandem with double steering, which may be readily converted into

Model 70—Men's roadster. Price, \$50.

single steering, and a combination tandem, each selling at \$75, comprise the tandem line. The double diamond machine is made in two heights of frame. Model 75, having a 22-inch frame, is illustrated. All machines are fitted with the Liberty one-piece detachable sprocket, which may be removed by simply taking out the locking bolt, without disturbing the chain adjustment or separating the chain, and which has the teeth cut on the same plan as that inaugurated during the season of '98 by the Liberty company. There are only five engaging teeth which do

Model 75—Double diamond tandem. Price, \$75.

Model 77—Combination tandem. Price, \$75.

any work, the other small teeth acting merely as guides for the chain. It is stated that the trial given this form of sprocket has demonstrated its smooth, easy running qualities beyond a doubt. The Liberty direct spoke hub flange, which was first introduced by this company in '92, is retained, it having proven itself so satisfactory in the past that no change is made. It differs from some forms of similar spoke flanges in that the projections for securing the spoke heads are made integral with the hub barrel, there being no brazing or other means of attaching separate parts employed. The

options in gears, bars, tires, saddles, handlebars, etc., are broad enough to satisfy the most exacting.

ORNATE BICYCLE BELLS.

A distinctly new departure has this year been made in the ornamentation of bicycle bells by the New Departure Bell Co. of Bristol, Conn., which has supplemented its well

known lines of New Departure and Bristol bells with the ornate designs here illustrated. The dragon, turtle and rattlesnake bells have the figures standing out in high relief from a mat or velvet surface and the eyes

of the dragon are set with rubies and those of the snake and turtle with emeralds. Another design not shown is that of a lion's head with long flowing mane and ruby eyes. These designs are handsomely modeled, hand

chased and finished in a rich antique statuary bronze with base and clamp to match. In this line of bells the New Departure lock clamp only is used, and the gongs are all of the square beaded pattern, which is this year

enriched by a rope fillet at the junction of the gong and bead.—Another novelty which the New Departure company is placing upon the market is the push button flag bell. On a rich mat background appears the Ameri-

can flag surrounded by a highly polished and finished gong. The stars are silver on a blue field and the stripes are alternate red and silver, the colors being of the correct shade

and in hard enamel which will not crack or peel off under exposure to weather or wear. The alarm is operated by a push button, and turning the gong to the right with the hand rewinds the bell, which is necessary only at long intervals. The L. A. W. bell which has so long been one of the leading designs of this company, has been improved for this season and is more artistic than ever, the center being set with a large, finely cut brilliant amethyst. The League bell is furnished with lock clamp or plain clamp, with dark oxidized background below the emblem or natural velvet nickel-finished as desired.

REMINGTON MODELS READY.

The Remington Arms Co., of Ilion, N. Y., has completed samples of its '99 line and offers the trade six patterns of adult machines, four of which are here illustrated. Models 47 and 48 are men's and women's bi-

Model 47—Price, \$35.

cycles to sell at \$35. They are similar in design to models previously made by the company and while they list at a popular price are constructed with sprockets, handlebars, pedals, seat posts, hubs, cranks, and other important metal parts made of first-class material by competent workmen in the Remington factory. The hanger is dropped 2¼ inches, 1½-inch tubing is used, Dunlop or Kangaroo tires and Sager saddles are sup-

Model 48—Price, \$35.

Model 56—Price, \$50.

plied as regular equipment, and 3-16-inch B block chains are fitted. The company's \$50 machines, Models 56 and 51, are fitted with crank shafts and cranks forged in one piece, though the reliable Remington three-piece hanger equipment is retained on Models 47 and 48. The joints on the \$50 patterns are flush throughout and the rear forks and stays are made of oval tubing which is not cranked as ordinarily but runs straight from end to end. The hanger is dropped 2¼ inches. The main frame tubes are 1½ inches in diameter with the exception of the top

Model 51—Price, \$50.

curved tube in the lady's model, which is one-inch. The Remington patent chain, in which the blocks as usually constructed are dispensed with and which has been well tested during the season past, is fitted to these models. The claim made for this chain is that while it may wear, as the best of chains will, it is absolutely guaranteed against stretching. The seat post is of special construction and has an adjustable sliding cross bar of solid bar steel. The post is held without any of the common clamping devices, it being secured in the frame by a simple wedge piece, the strong point of

which is that the more weight that is placed on the saddle the tighter the post is wedged. The rims and guards are enameled in maroon, while the frames are finished in black, maroon and dark green. Pedals of

home manufacture, the appearance of which is shown in the illustration, will be fitted and a choice of bars to meet all requirements is offered. In addition to the above

THE CYCLE AGE

illustrated patterns, the Remington company will continue to market its models known as 26 and 27, which will list at \$25.

**CUTTING SADDLES, MODELS E AND T.**

Two favorite patterns from the large line of saddles manufactured by Cutting, Kaestner & Co., 241 South Jefferson street, Chicago, are illustrated below. Model E, of which a top view is presented, is a man's

saddle with a long pommel and a wide seating surface. It is built over a steel base padded with felt and covered with leather. Plain truss wire springs are used. The weight is 16 ounces. A lady's padded saddle built over a steel base 7 3/4 inches wide by 9 inches long is offered at a popular price in model T, of which a bottom view is shown. The saddle is fitted with the company's original one-piece coil spring, which will be a feature of several of the '99 Cutting patterns. The strictly cash system of sales which was carried out during the past season by this company has proven so satisfactory that it will be continued for the coming year, thus

allowing prices to be reduced to a point which makes it unprofitable for the purchaser to buy on the long time payment plan.

**WORKING DOUBLE SHIFTS ON WOOD RIMS.**

The Fairbanks-Boston Rim Co.'s factories are running day and night and shipments have been made this month to Hamburg, Berlin, Paris, Cape Town, Johannesburg, and other foreign cities. This, considering that Fairbanks-Boston rims usually command the highest prices prevailing in every

market of the world, seems sufficient evidence not only of the superior quality of the rims but of the very up-to-date and energetic management behind the business. Excellent recommendations of the enduring qualities of these rims are the facts that the late six-day race in New York was won on them and that the McIlraths, who recently returned to Chicago, made their tour around the world on bicycles fitted with the Fairbanks-Boston linen covered rims. The convenient location of the Brantford factory with relation to the supply of raw material and the superb system by which this is rapidly converted into the finished product, are tersely expressed in the words of a traveling man who has just returned from a visit to the Canadian factory, as follows: "All they have to do is to step out in the back yard, saw down a big maple tree, shoot it into the end of the factory and it comes out rims at the other end."

**WHY STEARNS FEATURES ARE DISTINCTIVE.**

By making in their own factories all of the parts and fittings that go into the manufacture and equipment of Stearns bicycles except the raw steel, tubing and balls, and the saddles, tires and tool bags, E. C. Stearns & Co. of Syracuse produce a line of bicycles which embody so many features peculiar to themselves that there is no possibility of mistaking them for the product of an assembling shop. While Stearns machines and fittings are distinctive and not found on other bicycles—a feature wherein lies part of their value to agents—there is nothing "freakish" about them in design of frame or in the mechanics of the bearings. Especial attention of the trade is called to the new section the company is using in its rims for next year. It is of V shape and comparative tests by the company show that it combines great strength with light weight. E. C. Stearns & Co. have a completely equipped wood working plant in which they make all of their own rims from selected rock maple. Each of these rims is carefully inspected and tested, after which it is given the handsome orange finish which is its distinguishing mark. This finish is of the same quality as that used on the finest grade of carriages and effectually protects the rim from the action of the elements, thereby preserving the natural life and strength of the wood.

**CHAIN LINK SOLD SEPARATELY.**

The illustration below shows more plainly the construction of the repair chain link made by the Indiana Chain Co., of Indianapolis, than cuts previously shown. The

main advantage of the link is that it can be put into a chain by any rider without the use of a tool of any kind. The link with its accompanying pins is sold separately for use on chain of any make.

**VINDEX MAKERS READY TO FILL ORDERS.**

The line of Vindex bicycles, as announced for next year by the Reading Cycle Mfg. Co. of Reading, Pa., will consist of three models, known under the trade names of Vindex Light Roadster, listing at \$50; Vindex, at \$40, and Simplex at \$35. All of these models have been considerably improved over last season's models and have been well received, the majority of the company's former agents, as well as a number of new ones, having already signed contracts for the coming season. The Reading company reports that from present indications its business the coming season will far exceed that of all previous years. It has been operating its factory since October 1 on new goods and is now prepared to fill orders promptly.

**ORDERS COMING IN FAST.**

Arthur K. Peck, general manager for the Barnes Cycle company of Syracuse, N. Y., states that the outlook is unusually bright for a good volume of business during 1899. More orders have been booked than ever before at this time and the contracts are of a liberal nature. Orders are coming in from Japan, South Africa, Australia, Germany, and France. The effect of lower prices is to make the manufacturers more conservative, he thinks, and get the business down to a hardpan basis. At present 300 men are employed at the factory and during the height of the season, which will begin soon, the plant will be run full capacity with 650 men. The company has plenty of orders for immediate delivery. There is an increase in the number of orders for chainless machines and Mr. Peck says as many high priced as cheap bicycles are being sold.

**OFFERS A HANDSOME CALENDER.**

The United States Rubber Co., 15 Murray street, New York, have gotten out a very pretty screen calendar, 9x15 inches, in four

panels, showing the four seasons. The original paintings are the work of the best artists in New York, the lithographing in ten colors by leading American lithographers. The rubber company offers to mail one of these calendars to anyone who sends a two-cent stamp, mentioning this paper.

**STEARNS' NEW HANDLE BARS.**

The illustrations below show in a very graphic manner the exact appearance of the handlebars of the Stearns Yellow Fellow, manufactured by E. C. Stearns & Co.,

Syracuse, N. Y. The picturing of handlebars in place on the new machine, which plan is followed out in the '99 Yellow Fellow year book, gives a much better opportunity to judge of their exact relation to the front

end of the frame, the steering head, etc., than when the bars are illustrated as entirely detached. All of the Stearns bars with the exception of No. 21 are 17 1/2 inches wide. No. 10 is an adjustable bar curved slightly

forward and with a 2 1/2-inch downward or upward curve according to which way it is turned. No. 12 is similar in shape but is non-adjustable, being brazed in an upturned position and used only when a front wheel

spoon brake is required. An adjustable bar with 2 1/2 inches drop and a curve similar to that of No. 10 bar but 20 or 22 inches wide is offered in No. 21, while No. 13 gives an adjustable racing bar with a 2 3/4-inch forward curve and a 5-inch drop. No. 20 is a non-adjustable low racing bar with a 7-inch drop.

**EIGHT FEATHERSTONE MODELS.**

The line of A. Featherstone & Co., Chicago, comprises eight patterns numbered from A to H and listing from \$50 down to \$20. Model A, the 30-inch wheel pattern, has 3 1/2-inch hanger drop, and Model B, the

other \$50 pattern, has 28-inch wheels and is equipped as a light road machine or track racer. The \$30 and \$40 machines are built in both men's and women's models. The \$40 patterns have the same crank hanger, seat post connection and fastening and gen-

eral equipment as Models A and B. The hanger used on these models is new and, as indicated in the illustration, is of the two-piece variety but differing in construction from the two-piece hangers used on Models

E and F. Each half of the divided axle is made in one piece with its adjacent crank. The left side piece has a long, square, tapered, longitudinal hole in its inner end

Model A—30-inch wheel roadster. Weight, 26½ pounds. Price, \$50.

Model B—Special light roadster. Weight, 22 pounds. Price, \$50.

Model C—Weight, 25 pounds. Price, \$40.

which receives the correspondingly shaped taper shank on the other section of the axle. The two are locked together by a long sleeve nut which is turned with a key,

there being no projection beyond the outline of the crank hub. As the cones which screw onto the axle sections are independent in their fastenings, the adjustment and alignment of the bearings is not disturbed by the removal and replacement of the axle and cranks, and it is not necessary to remove the pedals, sprockets, etc., to take the hanger apart. The balls are held in place by retainer rings and a sleeve which surrounds the axle. All adult models are fitted with a special seat post binder consisting of a split taper sleeve surrounding the seat post and drawn up against a corresponding taper machined in the outside of the seat cluster connection by a spanner-operated nut on top of the cluster. When it is desired to loosen or pull out the post the nut is unscrewed, a few light taps given the saddle, and the nut pushed down against the top of the cluster. The post may then be withdrawn. An original expander device is used to clamp the handlebars. Pedals of Featherstone make are fitted to the machines and the Featherstone tire made under the G. & J. patents constitutes part of

Model D—Weight, 26 pounds. Price, \$40.

Model E—Weight, 26 pounds. Price, \$30.

Model F—Weight, 27 pounds. Price, \$30.

Model G—Juvenile, 24-inch wheels. Price, \$20.

Model H—Juvenile, 24-inch wheels. Price, \$20.

the regular equipment. Models E and F Special, which in other respects are similar to the regular \$30 patterns E and F, are fitted with a special single-tube tire, the Dart, and sell at \$25.

#### BUNDY ACETYLENE LAMPS.

A booklet just issued by the Frank E. Bundy Lamp Co., of Elmira, N. Y., describes the construction and the action of the generating apparatus of the Bundy acetylene gas lamp. While lamps for bicycles, carriages, fire departments, headlights and for house and physician's use are made by this company, the generating parts are the same in all. The booklet describes the manner in which the Bundy generator aims at the even generation of pure dry gas, non-leakage and absolute water feed control. The manner of feeding the water to the gas so that the sup-

ply shall be the same at all times regardless of shocks or jars which would ordinarily tend to shake down an oversupply is one of the most notable points in the construction of the Bundy lamp. Much interesting and profitable information concerning acetylene lamps is contained in the booklet, which is now being mailed to the trade and to all interested parties who request copies.

#### COASTER BRAKES AND BI-GEARS POPULAR.

The ordinances of Buffalo, N. Y., prohibit coasting in certain prescribed districts of the city in the sense that the feet must not be taken from the pedals. As there are many long hills in the smoothly paved street within the proscribed territory, the announcement that the Automatic coaster and brake, made by the Eclipse Bicycle Co. of Elmira, is to be attached to many of the standard bicycles next season is hailed with delight by the army of Buffalo riders. This device and the Bi-Gear, made by Brown-Lipe Gear Co. of Syracuse, were introduced to the Buffalo public on a rather limited scale last year, but attracted widespread attention and many sales of the machines to which these devices were attached followed, and it is a safe prediction that both devices will be in common demand next season.

#### TRADE NOTES.

The John Lonn Sons' bicycle factory at Laporte, Ind., has just received 12,000 bicycle rims.

The Schumacher Acetylite Lamp Co., 84 LaSalle street, Chicago, will be represented in booth 60 at the Chicago Cycle exhibition, beginning January 7, and at the New York show beginning January 21.

The Coe Mfg. Co., 50 Warren street, New York, has been appointed sole selling agents for the complete line of the Whaley-Dwyer Co.'s stirrup toe clips and other specialties for the eastern and middle states, Maryland, Virginia, and Canada.

The American Machine Co., of Columbus, O., has removed its general offices for that territory to the retail house on South High street, where the company now has two very large rooms and an immense basement to accommodate the business.

The sundry and repair departments of the Julius Andrae & Sons Co., which were formerly located in the downtown salesrooms in Milwaukee, have been transferred to the new Andrae factory, making it more convenient for both the company and its agents, by saving time. Mr. Anderson, who has been in charge of this department for years, has moved to the factory also.

Charles F. Lott, for the past three years connected with the Anderson, Ind., Cycle company in the capacity of buyer and traveling salesman, will be at liberty after January 1 owing to the reorganization and incorporation of the company as the Erie Cycle & Motor Carriage Co., and will upon that date be open to engagement. He is well acquainted with the trade throughout Pennsylvania, Ohio, Indiana, Illinois and Michigan.

The Oriten, the only ten-seated multiplet ever built, is now in England, where it attracted much attention at one of the recent cycle shows. The length of the machine, as given by the Waltham Mfg. Co., is 24 feet and the weight 180 pounds. When this giant was landed at Liverpool no railway truck was found capable of taking such a long article and a timber truck of huge proportions had to be requisitioned from the newest line into the metropolis, the Great Central railway.

With the beginning of the new year the Olive Wheel Co., of Syracuse, N. Y., will increase its force of workmen to 150, the prospects for a big season's business being better now than ever before at this time of the year. Already 2,000 machines of '99 pattern have been completed and on December 22 the company closed a contract for 1,000 bicycles to be shipped immediately to Copenhagen. During the first week in January the company will ship a carload of bicycles to San Francisco.

#### American Cycle Machinery Wanted.

The Cycle Age is in receipt of a communication from a machinery house intimately connected with the English cycle trade, and with headquarters at Birmingham, which desires to secure the representation for Great Britain of some first-class American machinery concern. Further information may be obtained at the office of this paper.

# THE PASTIME AND SPORT

## WINS AGAINST MOTOR PACING

**Fournier's Petroleum Multicycle Proves too Slow for Elkes' Human Pacemakers.**

New York City, Dec. 27.—Motor pacing in open competition and against man pacing had its first trial in this country at the indoor races at Madison Square Garden last night, when Harry Elkes, paced by seven tandems, rode a twenty-mile match against Henri Fournier's petroleum motor, to be followed the first ten miles by Jay Eaton and the last ten by Teddy Goodman.

The battle was actually to have been between the pacemakers and Fournier. The former realized that their means of livelihood hung in the balance, while the Frenchman equally realized that if successful he would probably have lucrative employment for his machines so long as middle-distance racing remains popular.

When Fournier mounted on his funny machine, which puffed around the track like a little toy steam engine, the crowd stared for awhile, and then howled with glee, so incongruous, so out of place on a cycle track, did it seem; but Fournier, gradually turning on a little more power, flew around the track on a trial spin at a speed that opened the spectators' eyes. Eaton and Elkes started from opposite sides of the track, falling in behind their pacing machines as the latter came around to them. Elkes gained from the start, and on the third lap was on even terms with his rival. Fournier seemed unable to attain a high rate of speed as quickly as he had intended and for the first mile steadily fell behind. The pace was fast, 2:00 4-5, for the first mile and 1:57 1-5 for the second. At this point Elkes was a lap in the lead. Early in the third mile Fournier began to draw up on Elkes, when an accident put him out of the contest, to the satisfaction of scores of pacemakers and their friends present. The driving belt connecting the motor and the driving wheel of the Frenchman's bicycle parted and Eaton narrowly averted running into him.

Extra tandem pacemakers were sent on to the track to carry Eaton and Goodman the remainder of the distance, but the task was a hopeless one for them. When Goodman relieved Eaton at ten miles Elkes was leading by nearly three-fourths of a mile. His time at that point was 20:42 1-5.

At twenty miles, Elkes, who had ridden in splendid form, was one mile in advance of his rivals. His time for the distance was 41:41 2-3.

In the sprint races, Frank Kramer, the amateur champion, made his debut as an outlaw, winning the half-mile, with Ertz, last year's champion, second.

Harry Gibson, of Cincinnati, yept Michael No. 2, rode an exhibition half in :59 1-5, indoor record time.

Summaries of the professional events are as follows:

Half-mile, scratch—Oscar Hedstrom, first; Harry Caldwell, second; George Kraemer, third; Nat Butler, fourth. Time, 1:05 2-5.  
One-mile handicap—George Kraemer, 50 yards, first; Oscar Hedstrom, 40 yards, second; Robert Miller, 50 yards, third; Oscar Babcock, 80 yards, fourth. Time, 2:19.

### American Wins in Spain.

George Banker continues to be the drawing card on the European winter circuit, although he must have had some misgivings as to his reception at Murcie, Spain, on December 11, where he suc-

ceeded in winning the 1,000-meter handicap from scratch in 1:17 4-5, broke the track record, and won the tandem race with Tommaselli as team mate. Tommaselli defeated him in the Prix de Murcie 5,000-meter race, in which each rider took his turn at pacing until Tommaselli made his jump as usual and maintained his lead in spite of Banker's efforts, crossing the tape half a wheel to the good. Only one Spaniard took part in the races, and he suffered defeat throughout.

## TO GIVE UP HORSES

**Michael Decides to Stick to Bicycle Racing Under Weinig's Management—Enter His Successors.**

Now comes the announcement that Michael—the mysterious, the vacillating, who is married but has no wife, who though a bachelor sought a divorce in Crown Point, whose bitterest rival is his dear friend Tom Linton, who has repeatedly renounced racing on a bicycle to become the claimant against his newest chum, Tod Sloane, for jockey championship honors—this small but uncertain quantity has thrown over his new trainer, George McLeish, whom he took to Europe with him on his last trip, and under the management of Al Weinig will again enter competition races on the bicycle.

To what this sudden change of purpose is attributable is not made clear, but to any who has ever attempted to learn anything definite regarding the midget this is not surprising. The announcement states that Michael is to appear in middle distance races in San Francisco and elsewhere, starting in February under the management of Messrs. Kennedy, Brady and Tim Hurst. Weinig and Michael left New York last Friday night for Nashville, there to do three weeks' hard training before joining the six-day men at St. Louis on their way to the coast.

While Michael is leaving New York two other riders of miniature stature are arriving to take his place. These are Harry Gibson, of Cincinnati, known as Michael No. 2, and Joe Downey, of Boston, known as Michael, Jr. Gibson has beaten Martin at the middle distance paced game. Downey is an amateur of 5 feet 3 inches, 97 pounds in weight, and uses a 116 gear. He is a wonder in stature and is but 15 years of age. Downey is considered the athletic marvel of the age, for his ability already shown in a mile paced record of 1:46, a five-mile ride in second place back of pace in 9:27, and ten miles unpaced in 25:30. In the anthropometric chart he stands 409.2 in a test of strength where the average full grown athlete stands at but 500. Gibson will be matched with the professionals, Downey against Charlie Earl, the amateur hour record holder.

## Evolution of Cycling Dress.

The evolution in cycling dress for women has been rapid during the past three years. From the long walking skirts first used when cycling was not yet a recognized pastime, the nightmare season of bloomers was entered and passed, and now the sensible and becoming short skirt, divided or not, over bloomers is the vogue. In the same way the knee high boots, with leather or cloth tops, first especially designed for use on the bicycle have been superseded by a boot no higher than a golf shoe which does not wrinkle nor bind the muscles of the leg and which is not uncomfortably hot in midsummer and does not take so long as the others to lace or button.

## ENDORSE WHEELMEN'S EFFORTS

**Farmer's Adopt Resolutions at Their National Congress Favoring State Aid for Road Building.**

The Farmers' National Congress, which has just closed its annual session at Fort Worth, Tex., has passed resolutions strongly endorsing the system of state aid to road building, and commending the efforts of the League of American Wheelmen for its general introduction.

The passage of these resolutions marks a signal success for the highway improvement committee of the L. A. W. It means that the farmers, who have so long looked with doubts and misgivings upon the good roads work of the L. A. W., are beginning to understand that this work is in their own interest, and that by working in harmony with the L. A. W. they can bring about the construction of durable highways without being obliged to bear all the expense, as they have so long supposed they would have to do.

The Farmers' National Congress consists of about 450 delegates, representing nearly every state. It is the strongest agricultural body in the United States, a thoroughly representative body of wide-awake, up-to-date, although conservative, farmers, and was declared by William H. Hatch, for many years chairman of the house committee on agriculture, to have more influence with Congress than all other agricultural bodies combined. Its endorsement of state aid to road work will have much weight with the legislatures and with farmers generally, and opens the way for united action between its members and the farmers of the United States.

The passage of these resolutions is the result of the efforts of Otto Dorner, chairman of the highway improvement committee L. A. W., who has attended the sessions of the congress for three successive years. His farmer friends, who were delegates from Wisconsin, selected him to represent that state on the committee on resolutions at this last meeting, and this committee elected him as its secretary and passed the good roads resolutions he presented by a vote of 23 to 2.

The resolutions in full are as follows:

Resolved, That the best interests of American agriculture demand the construction of first-class roads connecting farms with market towns;

That the cost of their construction is too considerable to be borne by farm property alone;

That, as the entire population is interested in, and benefited, directly and indirectly, by good roads, all property ought to contribute to the cost of their construction, through the medium of a state tax;

That we endorse the system of state aid to roads, because it appears to solve the good roads problem in the farmer's interest; it largely decreases the cost of road construction to local communities, provides a means by which the large city taxpayers and corporations owning valuable franchises from the state are made to share in the expense, and properly leaves it optional with farming districts to avail themselves of its provisions or not, as they may choose;

That we believe the state aid system suitable to most states in the union, and commend the efforts of the National Road Parliament, the League of American Wheelmen and the government office of road inquiry to make this system of road construction generally known and understood, and to bring about its general adoption.

**AGENCIES WANTED.  
AUSTRALIA AND NEW ZEALAND.**

Frank Grimley, 263 and 264 Clarence St., Sydney, N. S. W., importer of bicycles and their accessories, bicycle makers' materials and tools, for trade buyers, is open to negotiate for exclusive agency for manufacturers of those lines and to introduce and push the sale of their goods throughout Australia and New Zealand on manufacturers' account or to purchase right out. Quotations and samples of novelties invited. Unquestionable references on application to the proprietors of this journal.

L. A. W. for riding at unsanctioned meets in this country, he will resume racing in France. Regarding the matter, he is quoted as saying: "Why should I pay \$200 to the L. A. W.? I can ride at home. Our riders' organization is so nearly the same as the American Racing Cyclists' Union here and our plan of controlling the sport is so nearly the plan adopted here, that in France I am confident union men will ride as much as they desire. Our U. V. F. is composed of the track owners and promoters. So is yours. Our syndicate of racing men is the same as your union. The U. V. F. works with the syndicate, and the latter has representation in the U. V. F. The tracks in our country give meets once each year for the benefit of the racing men's fund, as yours will another year. The entire plan in France is the same as has been adopted here, and the U. V. F. has only to know that the National Cyclists' Association is the strongest to form an alliance with it. In the meantime, I anticipate not the slightest trouble in racing at home, and shall not worry at all."

#### NEWS IN BRIEF.

Platt Betts, the English rider, will desert the paced game next season and enter the sprints.

J. Frank Starbuck, of Harrisburg, Pa., has secured some one to back him for a racing trip to Australia.

Jimmy Warburton, who was a member of the N. C. T. A. pacing team last season, has gone on the vaudeville stage in London.

Tom Cooper is planning a trip to Europe next summer to enter into competition with the European cracks. It will be his first trip abroad.

Lee Richardson will go to London next year under contract to appear at the Alhambra theater June 4 for a three months' engagement.

Some of the best French cracks have gone away to serve their time as soldiers. They are Morin, Mercier, Boulay, Nieuport, Prevot and others.

Paul H. Nippert, a prominent young insurance man, and a lover of outdoor sports, has been elected president of the California Associated Cycling Clubs.

Eddie McDuffee, Harry Elkes and Harry Gibson have decided to follow Jimmy Michael to San Francisco. Each of the three hopes to arrange a match race with the little Welshman.

Trainer John West, who had decided to leave the race track, will accompany Miller to San Francisco and care for him in the forthcoming 142-hour contest. After that he says he will retire.

Eddie McDuffee has decided to do no riding for records this winter. He expects to go to California in order to arrange a match with Jimmy Michael. He has wanted such a race ever since the fiasco in Philadelphia last August.

A young Englishman named Albert Towner announces that he has determined to undertake the task, in which Teddy Edwards failed, of riding 365 consecutive centuries, beginning January 1. Towner says that he will not vary his route, but intends to ride from London to Brighton and back each day for a year.

W. A. Brady, promoter, is quoted as authority for the statement that a six-day race under the provisions of the Shanahan law will be run in Chicago some time this winter, probably in February or early in March. The long-distance men who are going to the coast to participate in the San Francisco grind are expected to be competitors in the Chicago affair. The Illinois law makes it compulsory on the men and management that the competitors rest every twelve hours or oftener.

A good roads bill is to be submitted to the Illinois legislature during the present session. The bill provides that the governor shall appoint a good roads commissioner which shall select several highways connecting the important cities and towns of the state to be improved at the expense of the state and of the municipalities through which the roads pass. It is proposed to employ convict labor to break the stone to be used for road-building material.

#### MORE IMPROVEMENTS.

Further additions in train service have recently been instituted by the Baltimore & Ohio Railroad in inaugurating a day-light schedule between Chicago, Akron and Cleveland leaving Chicago 10:25 a. m. via train No. 8 and reaching the points named the same evening. This is in addition to through train service with Pullman sleeping car between the same points via train 46 leaving Chicago 7:30 p. m. daily. Fares to Cleveland via the Baltimore & Ohio Railroad are lower than by any other line. For detailed information call at ticket-office, 193 Clark Street, Auditorium Hotel, Grand Central Passenger Station or address B. N. Austin, G. P. A., Chicago.

#### MISCELLANEOUS.

A slight swerve may mean the loss of a race. The long pommel gives just the support needed to keep the wheel steady in a spurt. Eddie Bald, Jimmy Michael and Earl Kiser use it, and they cannot afford to have anything but the best. Once a Christy Rider Always a Christy Advocate.

A. G. SPALDING & BROS., NEW YORK and CHICAGO

#### Crane is a Great Rhymester.

Charles S. Crane, the general passenger agent of the Wabash, is quite a poet, and has written many nice things. Recently he read the poem on the "Music of the Wheels," written by E. E. Coyle, for the Baltimore Morning Herald, which runs as follows:

#### MUSIC OF THE WHEELS.

When you're riding on the railroad  
At a mile-a-minute crack,  
Did you ever note the rhythm  
Of the wheels along the track?  
Is there any great composer  
Of sharps and flats and bars  
Can equal in his cadences  
The music of the cars?

Whether dashing through the meadow,  
Or the tunnel's choking grime,  
You will never hear them falter  
From the measured beat of time;  
Charging wildly 'mongst the mountains,  
Or by the river's bank,  
You will always find them playing—  
Click-clickety-click-clank.

Every air that has been written  
Since the days of wicked Cain  
Finds a fit and perfect setting  
In the rhythm of the train;  
From opera to comic song,  
From Patti down to Cline,  
You can hum all sorts of ditties  
While rushing down the line.

After reading the above Mr. Crane got his typewriter in order, and by screwing up the optical lever ground off the following:

It's too bad to spoil the story  
Told in cadence sentimental,  
But it's not so on the Wabash  
With its famous "Continental."

If you are about to travel  
Please note the following points,  
The Wabash track is perfect,  
And you cannot count the joints.

In its wheels there is no music,  
At a mile-a-minute gait;  
And of course there is no rhythm  
On a track that's up-to-date.

There is no measured beat of time;  
In fact it can't be measured.  
We beat our rivals every time,  
A fact that should be treasured.

#### WANTED

**WANTED**—To know whether the roller chain is better than the block chain.

#### FOUND

**FOUND**—That some of our customers prefer the block chain; others use nothing but the roller chain.

#### FOR SALE

**FOR SALE**—The Roller Block Chain, which combines the rigidity and lasting qualities of the block with the frictionless running of the roller chain.

#### PERSONAL

**PERSONALLY** the manufacturer and the dealer can afford to investigate the merits of a chain that pleases everybody. We show it below with our special coupling link which can be detached without tools.

## AND TRADE REVIEW

Vol. XXII—No 10.

CHICAGO, JANUARY 5, 1899.

NEW SERIES No. 59.

### BOARD OF TRADE TO DISBAND REQUISITE STOCK VOTE CAST

Six Shareholders Meet and Satisfy the Wishes of a Majority of the Members.

New York City, Jan. 2.—Five stockholders fretted with impatience this morning in the rooms of the National Cycle Board of Trade while waiting for a sixth to appear and lend assistance in strangling the organization.

The absentee doubtless had scruples about running to a funeral.

"Let's go ahead without our absent brother," suggested the Man at the End of the Rope.

"But supposing it should slip again?" was the apprehensive rejoinder.

The headman shuddered.

It Was Necessary to Adjourn.

There was nothing to do but adjourn and visit the Poland water establishment across the street.

"This is on me," said the headman, thereby confirming his reputation for wit.

In the afternoon the missing stockholder put in an appearance and was greeted with tumultuous enthusiasm. He had skated across the north river from Jersey with forty-two shares of stock securely strapped to his back; time—2 hours and 11 minutes.

"We will now proceed to do those things which we have left undone," declared the Man at the End of the Rope.

"Are strangle-holds barred?" inquired the new comer.

"The committee on arbitration and laws will answer," blithely retorted the headman.

The secretary made a note of the joke and proceeded to count the shares represented.

"Announce the vote in a loud voice, Mr. Secretary," said the Man at the End of the Rope.

The secretary quailed—he is an ardent sportsman. He drew in his breath. He shot it out again. Then he spoke:

Twenty Shares to Spare.

"I see your finish, gentlemen. Two-thirds of the stock would be 594 shares—614 shares have been voted for the disbandment of the Board."

At the conclusion of the meeting the simple editor of the Wheel begged permission to read a paper setting forth his views on the subject of "Brazing by Immersion," but was told that his head tube was cracked and the spelter in it had run out.

Local Show Spaces at a Premium.

Philadelphia, Jan. 2.—The rivalry for desirable spaces among prospective exhibitors at the coming show of the Phila-

delphia Cycle Board of Trade recently became so bitter that the committee, as in former years, decided to auction off the choice to the highest bidders. The attendance at the sale was excellent and the bidding spirited. Among those present were representatives of not a few out-of-town manufacturers and the agents of two French makers of automobiles. In all, about 120 of the 200 available spaces were disposed of at premiums ranging from \$5 to \$65. Representatives of no less than half a dozen automobile makers, including the two French firms above mentioned, secured spaces.

### IDE PLANT RUNNING AGAIN.

Former Employes Secure Backing and Form a Company—Assembling Begun.

The plant of the F. F. Ide Mfg. company in Peoria is now being operated under the same name by a new company composed of men who were former employes of the old company, backed by some outside capitalists whose names are withheld. F. F. Ide is not interested in the new organization, which will not be a stock company, and it is not the intention at present to incorporate it. Instead of manufacturing the machines complete, the company has placed contracts with eastern makers for the parts, which will be assembled in the Ide plant. The product will be marketed for \$35 and will be built after the pattern of the Ide machines.

The old company sold off most of the machinery of the plant so that there were but a few pieces left in the building when it was decided to renew operations. Additional equipment has been purchased and set up, however, and the plant entirely renovated so that work could be recommenced with the beginning of the new year.

### President of Codling Mfg. Co. Dead.

Lester Goodenough, who was president of the Codling Manufacturing company of Bristol, Conn., died December 26. Though feeling his loss keenly, it is thought the business of the company will not be affected.

### WANAMAKER TO SELL ORIENTS WILL GUARANTEE THEIR PRICES

Interesting Letter Which Discloses Wanamaker's Opinion Concerning the Late Humber Catastrophe.

Orient bicycles will be sold this year in New York and Philadelphia by John Wanamaker. He will handle no other high priced model. Last year he sold 16,000 machines at retail, and this year he expects to sell from 20,000 to 25,000. His line will consist of the Continental at \$25 and \$30 and Orient patterns at \$50, \$65 and \$75.

This information will surprise people who have been led to believe that Wanamaker was heavily responsible for the cut in Humber bicycles which electrified the trade toward the close of last season. But in a letter presented in full elsewhere in this paper, Wanamaker recites the history of this catastrophe so plainly and so defiantly as to leave no room for doubt concerning his part in the transaction. Parts of this letter are here-with reproduced:

Our business is conducted upon the soundest mercantile principles that we can understand, and catch-penny methods of any sort whatever find no welcome here. If there is one man in the United States that, more than any other, knows in his inmost mind and heart the truth of that assertion, it is the late resident director of the Humber company in America. Through him we made a contract in the autumn of 1897 for 2,500 bicycles. The roadster, the most important model in that contract, was to be sold at \$100—other models to be slightly higher.

### Cut Due to the Humber Co.

The early demand for bicycles was disappointing, and an agreement was reached in March for the reduction of the roadsters to \$75, and other models in proportion. The Humber director was more anxious than we for this reduction. Rebate checks were sent by us for the amount of the reduction to all previous buyers, and an allowance of \$5 a wheel was made by the Humber company on the entire contract. This sealed the fate of expected profits on our Humber bicycle business, as the margins were reduced below the cost of distribution.

Having implicit faith in the Humber company, and being assured of their support we guaranteed the price of the Humber wheels to all buyers, to the date of the expiration of our contract and fully expected, because of certain additional assurances, to maintain them until now.

### Did Not Violate the Contract.

We accepted and paid for all the wheels called for by our contract, and fulfilled our obligations in letter and spirit. In spite of a slow market we held our way firmly in consequence of a verbal promise from the Humber company that none of their wheels would be manufactured in excess of orders. Three responsible witnesses can attest to the truth of this statement.

Within a few days of the first of September we were astounded by the statement on behalf of the Humber company that they had accumulated a stock of 860 bicycles which they demanded we should buy for our own protection. The promise not to

manufacture wheels in excess of orders was the rock upon which we based our firmness as to retail prices. We vainly urged the demands of good faith that required the Humber company at least to carry their stock until next spring, and were met with the threat that, if we did not buy them they would be offered elsewhere.

#### Compromised by Humber People.

We refused, as would any self-respecting merchants, to be coerced. The Humber company had our good money. We had a large quantity of their wheels. Then followed the suicidal action of the Humber company. The wheels were sold and on September 10 we knew that roadsters were at stake, and we reduced the price to \$40. We were unwilling to be publicly compromised by another's loose views of square dealing. Various transactions in Humber wheels of which we were ignorant followed, and the wretched scramble about prices was the result. We never owned a Humber bicycle except such as we bought directly from the Humber company.

#### Will Guarantee Orient Prices.

After such a disappointing experience we naturally felt very cautious about making another deal for high grade bicycles, and from our former experience saw that it would be necessary not only to get a bicycle which was as good as the best, but one that was made by a reputable company who kept abreast of the times, and who sold goods at an honest price, and had one price for all.

We guaranteed the price of the Humber and upheld it until we were compelled to cut by the Humber company. We shall guarantee the price of the Orient, and do not believe that we shall be compelled to cut the price on it by the Waltham manufacturing company.

JOHN WANAMAKER.

#### Second Overman Dividend Deferred.

The creditors' committee having charge of the affairs of the Overman Wheel company, of Chicopee Falls, Mass., has voted that the January dividend to the creditors ought to be deferred and the cash in hand be devoted to the purchase of material and payment of labor for the continuance of the business. The committee consists of three of the heaviest creditors, who, with the trustee, represent about \$150,000 of the debts of the company. The creditors agreed last year to give the company two years from January 1, 1898, to meet the \$632,000 indebtedness standing against the firm, one-quarter, or \$158,000, to be paid semi-annually, beginning July 1 last. It was agreed, however, that the company could vary the time of the individual payments, provided that the whole amount be paid by January 1, 1900. The first payment was met July 1, and \$158,000 was paid. The second payment, due last Sunday, is the one which the committee has decided to defer. It is stated that the company could meet the present payment if the creditors deemed it necessary, but a large part of the money would have to be borrowed and the creditors decided that a postponement of the payment would better conserve their own and the interests of the company. The company has apparently a bright year before it, and there is renewed confidence that all the debts will be paid and the concern placed on a sound basis.

#### Tillinghast Patent Case Argued.

After nearly three years of evidence taking in the suits of Theodore A. Dodge against F. H. Porter, et al., doing business as the Reading Rubber Tire Company, for alleged infringement of the Tillinghast patent, No. 486,915, granted November 29, 1892, on single tube tires, the case was argued in the Circuit Court of Massachusetts before Judge Colt ten days ago. The testimony was voluminous, covering 1,200 pages of printed matter, and the courtroom was crowded with exhibits. This has been a bitterly fought case, neither party leaving a stone unturned to sustain or invalidate the patent. The defense attempted to show that the improvements were not patentable. Decision of the court was reserved. It may be many weeks before the result is known.

## PALMER-HUSS TIRE DECISION CLAIMS IN EACH PATENT VOID

### The Decision Does Not in Any Way Threaten the Main Claims of the Palmer Patents.

The text of the decision recently given in the Lozier-Palmer patent interference suit by the Circuit Court of Appeals at Cincinnati has been put in possession of the lawyers. The decision does not in any way threaten the validity of the main claims in the Palmer patents recently purchased by the B. F. Goodrich Co.

It is the opinion of counsel that the Goodrich company is left with a clear and unobstructed protection with regard to the Palmer tire under the patent reissued on July 25, 1898. The company is also left in possession of the Palmer fabric patent, involved in the above suit, except as to the first three claims thereof. This patent has eight claims, the last five of which are unaffected by the court's decision.

#### What the Goodrich People Say.

The Goodrich lawyers contend that all claim of Lozier to any right to interfere with the manufacture of Palmer tires, or to authorize others to manufacture Palmer tires, or to claim a royalty from those making or using Palmer tires, are utterly destroyed by this decision; but he has still remaining to him the patents of April, 1893, on the Huss thread tire, which is a tire having a single layer of threads running transversely across the tread of the tire with an interwoven warp and wool thread reinforcement at the sides thereof.

#### The Point at Issue.

In deciding the issue the court first says the nature of the controversy relates solely to the question whether the Huss patent granted May 14, 1895, for a fabric is valid or invalid, or whether the first three claims of the Palmer patent, issued March 7, 1893, are valid or invalid. The lower court had ruled that the only question in issue was the relative priority of the two inventors with regard to the subject matter of the three claims of the two patents, being bound to assume that the subject-matter was patentable and that one of the patents was valid.

#### Lower Court Ruling Rejected.

The Court of Appeals, after an extensive and technical discussion of the interpretation to be placed upon the statute authorizing this class of litigation, concluded that the lower court ruled erroneously; and that the question before the court was not merely the relative priority on an assumed patentable invention of the parties to the litigation, but also the validity of either patent for any other cause; and particularly that the court was authorized to inquire whether either patent was void because the same patentee had obtained an earlier patent upon substantially the same invention.

#### Priority Not Involved.

The court accepted without question the contention of each side as to the date that Palmer and Huss respectively made their inventions, and as to the specific nature of the steps of each in connection with this matter; but held that this question of priority was secondary to the main question of patentability.

On the matter of patentability the court showed that the Palmer fabric patent was applied for after the application of the Palmer tire patent, which latter was applied for on August 9, 1892, and was issued on January 10, 1893. The court called attention to the fact that the first three claims of the Palmer fabric

patent involved in the litigation with Lozier were substantially the same as certain claims filed originally with the application for the Palmer tire patent, and that the Palmer tire as described in the tire patent would in its preferred form necessarily employ the fabric claimed in the three claims in controversy.

#### Three Claims Unlawfully Allowed.

The court pointed out that on the expiration of the Palmer tire patent the public should be at liberty to make the Palmer tire exactly as described in that patent; but the subsequent issue of a separate patent on a fabric needful in the manufacture of the Palmer tire in its preferred form would debar the public from this privilege for two months beyond the term for which the Palmer tire patent was granted. The court held this to be contrary to the spirit of the law, and that the patent in controversy by reason of this condition was unlawfully issued to the extent of the three claims in controversy.

#### Ruling on the Huss Patent.

With regard to the Huss patent the court shows that Huss bases his claim to priority altogether upon certain work done by him in April, 1892, in his experiments in the manufacture of tires at the Chicago Rubber Works. The court also shows that as the result of those experiments Huss applied for and received two patents of April 15, 1893. The court holds that in these two patents Huss attempted to and did cover all the invention he made in the course of these experiments, and that he is not at liberty to separate part of those experiments or a part of his invention then made from the rest, and, making it the subject of a later patent, obtain a protection which will prevent the public from enjoying the free use of the invention patented in April, 1893, after the 1893 patent shall expire.

#### An Unprofitable Inquest.

The court makes reference to the contention of counsel that the fabric used by Huss differed materially from the fabric patented to Palmer, but declines to pass upon this question at all, saying that inasmuch as the first three claims of the Palmer patent are void, because their subject-matter is fully set forth in the Palmer tire patent and made an essential element of some of the claims of that patent, and that three claims of the Huss patent in controversy are void, because their subject-matter was fully described and claimed in certain claims of Huss' prior patents granted to him in April, 1893, the issue before the court resolved itself into an "unprofitable inquest as to who was the first discoverer of a nullity."

The court orders a decree to be entered, declaring the first three claims of the Huss and Palmer patents void.

#### Would Tax Bicycles in Washington.

Washington, D. C., Jan. 2.—The district commissioners, who have for some time had under consideration the draft of a proposed bill giving the commissioners authority to impose a fee or tax for the compulsory registration of all bicycles ridden in Washington, have reported to the chairman of the senate district committee that they think the bill should be amended to make a specific tax of not less than \$1 per year on each bicycle. Should the bill be passed it would become operative at once and would mean an increase of about \$50,000 yearly in the revenues of the district.

A tax on a business is not rendered invalid by the fact that it is onerous as compared with the taxation of other lines of business.

## THE MODEL BICYCLE SWINDLE CLEVER CIRCULARS SENT OUT

**Bicycle With Lamp, Cyclometer, Bell and Holder for \$3.85 Humorous Trickery With Ambiguous Words.**

The mail order system of doing business has its troubles. So many gay deceivers issue carefully worded circulars with offers of incredible bargains for the gullible, and so many persons are caught by their bait that ere long any small or unknown firm trying to do business by mail, however honest may be their intentions, are likely to be met with profound distrust. In this manner the fraudulent schemers largely benefit the department stores and well established large mail order houses, building up a great bulwark of general distrust which effectually protects the known houses against competition from smaller concerns.

### The Boldest Circular Extant.

The bicycle trade has had more than its share of fly-by-night concerns and the latest swindle of this kind is built up on a circular so cleverly, audaciously and withal humorously worded, that it merits reproduction. As taken from a letter received by a Muncie, Ind., man, it reads as follows:

New York, Dec. 15, 1898.

Kind Friend:—It is our duty to introduce our Model bicycle in every town, and to accomplish this and widely advertise our goods, we are prepared to make any sacrifice, and we make the following special offer to you, which has never been made by any company, bicycle or otherwise.

### OUR CHRISTMAS PRESENT AND SPECIAL NEW YEAR OFFER TO YOU.

For the next thirty days only we will distribute absolutely free 500 Model bicycles throughout the United States and Canada, only one to each reliable person, who will promise to show it around town to his friends; and we have selected you as one to represent your town. With each Model bicycle we also send a beautiful nickel-plated smokeless bicycle lamp with colored glass side lights, also a nickel-plated electric ringing bicycle bell, also a nickel-plated cyclometer, registering 10,000 miles, and a nickel finish bicycle stand.

We only ask you to send up \$3.85 to pay the cost of boxing, shipping, charges, expressage, etc., of goods to your address. Then we will immediately send (all forwarding charges prepaid) a Model bicycle, bicycle lamp, bell, cyclometer, and bicycle stand, and you can keep them without further cost.

The Model bicycle is a perfect charm and is the simplest and strongest made, strictly high grade, modeled after a \$100 bicycle. Frame in one piece, no awkward bolts or nuts visible, latest style drooping handle bars and newest detached steel chain. You cannot ride this wheel and puncture and cut tire. This is not a second-hand bicycle and does not weigh 30 pounds, but is light and easily carried and new from factory, with guarantee for one year. Don't pay \$100 for a bicycle, lamp, bell, etc., until you see this handsome model, and the beautiful lamp, bell, cyclometer and bicycle stand we send. This liberal offer of 500 Model bicycles given away may seem large, but we will do as we say to advertise them. Some concerns spend large amounts in advertising in papers and magazines to introduce their goods. We prefer to introduce ours by making you the above offer, and we know you will advertise them by showing them to your friends in your town, thereby introducing it and creating demand for sales. Take advantage of our offer now; it is only good for thirty days (offer will be withdrawn January 15), and you may regret it, as the above 500 Model bicycles will not last long. Send \$3.85 at once, to pay for shipping, etc., and promise to show it to your friends, and we will ship goods immediately after your money is received. During the year 1899 we expect to do a very large business through the advertising of our goods by you and those who accept our offer. Send money at once; don't delay.

MODEL BICYCLE COMPANY.

### Mistakes of the Schemers.

Model Bicycle company is an ornament to the profession to which it belongs. It has taken up the word "model," which by common consent is used incorrectly in the bicycle trade and, playing upon the famil-

iar understanding of the word as implying a full-sized, rideable bicycle, it expects to find shelter behind the correct meaning which implies only a miniature pattern. The company's little mistake of calling its ware "model bicycle" instead of "bicycle model" is, however, sufficiently grave to land its manipulators in the penitentiary, if caught, but the majority of victims who would receive "the perfect charm"—watch charm—which the company promises would probably take a less serious view and would consider that the joke was on them. Probably the "smokeless" bicycle lamp is part of the equipment of the charm, whose frame is "in one piece," and which "you cannot ride and puncture the tire," and which "does not weigh 30 lbs." Presumably the nickel-plated cyclometer always "registers 10,000 miles" in a lump, and the electricity for ringing the bell must probably be furnished by the \$3.85 purchaser.

The circular speaks for itself. It is so boldly humorous when read with some degree of complacency, that its authors are almost entitled to the "good time" which they undoubtedly expect to have in New York upon the proceeds of their scheme, before the gates of Sing Sing are opened for them through the instrumentality of the prosecuting postal inspector.

### Fichtenburg Ready to Settle.

The creditors of the League Cycle Mfg. Co., of Milwaukee, have been ordered to show cause why the assignee, Henry Herman, should not be allowed to accept \$3,750 from Moritz Fichtenberg, president and treasurer of the company, in settlement of the claims against him. Mr. Herman shows in his petition that he has disposed of all of the assets of the company excepting a claim against Mr. Fichtenberg for moneys amounting to \$16,672.87 and for bills receivable amounting to \$2,300, which he asserts have been wrongfully appropriated by Mr. Fichtenberg. The latter denies the allegation, and in answer to a suit which the assignee has instituted to recover the amounts asserts that the company was indebted to him in large sums, and that the money was paid to him in settlement. Mr. Herman says he has received an offer from Mr. Fichtenberg to settle the controversies for \$3,750.

### English Rubber Men to Combine.

An important combination in the British rubber trade has just been formed for the purpose of controlling competition and regulating prices for all kinds of rubber goods, which will probably affect the tire trade to a considerable extent. The reason for the existence of a governing body is that the rubber competition amongst British manufacturers has lately become so keen in order to keep machinery going, that prices have been reduced below what was thought to be a fair and reasonable margin of profit. This is partly due to the withdrawal of the business of the Dunlop company, which has erected works of its own for manufacturing rubber, instead of placing large orders with various manufacturers, and also to the growing foreign competition.

### Will Not Affect Pope Company.

Hugo Bilgrain, the Philadelphia patentee of gear cutting machinery, is quoted as saying that should his recently instituted suit against the Pope Manufacturing company for the use of machines which he believes infringe his patents be decided in his favor, the Pope company would suffer no inconvenience or loss, since it would merely be required to transfer to him the royalty it is now paying to the other party.

Frank A. Hill, a Dallas, Tex., cycle dealer, was arrested recently, charged with attempting to burn up his store.

## MOTOR VEHICLES FOR EUROPE TEN-YEAR CONTRACTS PLACED

**A Parisian, Associated With Boston Capitalists, Orders \$15,000,000 Worth of American Vehicles.**

It is noted with much interest and some curiosity that one Count de Jotemps of Paris, president and general manager of a corporation known as the American Motors General Agency, which purposes to place motor vehicles on sale in Paris, London, Brussels and Vienna, arrived in Chicago last Wednesday and immediately placed an order with the Fischer Equipment company for the construction of 500 of its electric vehicles yearly for the next ten years.

### Five Thousand Vehicles from Chicago.

The contract provides for the construction of several different kinds of vehicles, such as cabs, coupes, broughams, victorias and twelve theater buses. The average cost will be about \$1,000, making the total of the ten-year contract secured by the firm \$5,000,000.

The vehicles are equipped with the Woods storage battery system recently described in this paper. A large advance payment has been made on the contract, it is said, which provides that fifty of the vehicles are to be ready for shipment to Paris by February 1. The company anticipates no difficulty in filling the contract.

### Depots to be Opened in Paris.

On March 15 sale depots will be opened on the Champs Elysees and Boulevard des Italiens, in Paris, and as the goods arrive offices will be established in the other cities named. It is the purpose of the agency to reserve a number of the vehicles for public use in the boulevards and parks.

Count Jotemps is reported to be a person of means who has associated with him Albert Geirger of Boston, a large real estate owner, and other Boston capitalists. Before coming to Chicago he had examined all the leading motor vehicles made in Europe and those made in the eastern United States.

### Contracts Placed in the East.

During his visit to America the count has also closed contracts with the Holyoke Motor Works, Holyoke, Mass.; the Stanley company, Newton, Mass., and the Overman Wheel company, Chicopee Falls, Mass., to furnish 1,000 vehicles a year for ten years to his company. The Massachusetts factories are to turn out steam, gasoline and petroleum motors.

With regard to the Fischer vehicles, the count said that he knew something of them before coming west, and that he liked them not only because of their handsome appearance, but because of their ability to store superfluous power which can be used when occasion requires, as in mounting steep grades, running through snow or sand and over rough streets. He says there is a growing tendency in Europe to use motor vehicles, and thinks his company will be able to sell all the vehicles contracted for.

### Strike at Badger Brass Works.

Fourteen workmen went out on a strike at the Badger Brass company's works in Kenosha, Wis., recently. The men were employed in the buffing and polishing departments, and were earning good wages, the majority of them more than \$2 a day. They demanded higher wages. The state board of arbitration held a conference with the strikers to effect a settlement.

# No Trouble <sup>to</sup> Show Goods

**I**T'S a pleasure to show them, and talk about them and write about them. That's one of the good things about good goods, goods that don't have to be apologized for (our kind). It's a pleasure, down-right enjoyment, to talk or write about them, dilate upon their beauty, explain their points of elegance in construction and contour.

If you haven't seen our lines for '99, write us and we will see that you have a chance to do so as quickly as our representative can reach you.

## Write Us, Anyway

Ask questions, make suggestions, criticize—anything you like, so we have a chance to talk our goods to you.

Let us hear from you and we will show you the handsomest and best goods ever offered since saddles were made; and prices are right.

Mention The Cycle Age

# THE CYCLE AGE

## AND TRADE REVIEW

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.  
ALL remittances should be made to THE CYCLE AGE COMPANY.

Copyrighted, 1898. All rights reserved.

### A CHALLENGE.

The Cycle Age admits the decay of the National Association of Cycle Dealers and abandons the right to be known as its official organ. Hence our front cover is bare of its familiar superscription; but out of deference to the sensitive feelings of two snarling contemporaries we replace it with a phrase which is intended to test their courage and honesty in serving advertisers. Any jury they may select to decide the issue will suit us.

### THE CURSE OF THE INDUSTRY

Unsolicited responses are being received endorsing the efforts of the Cycle Age toward abolishing all those forms of speech and writing by which the public are still being induced to expect regular annual changes of design and construction of cycle goods.

Many of the bearers of the industry evidently appreciate the heavy burden which the public's anticipations of season's changes impose upon them, and are ready to support the policy outlined in the article headed "Almanack Cycle Construction," which appeared in this paper last week. The remedy proposed involves no expense and promises a substantial return. It requires watchfulness and careful editing of advertising matter by each manufacturer and each dealer, and especially by those manufacturers who supply their agents with text for newspaper advertising.

The Cycle Age will do its part. Whether the rest of the press, the dailies and the cycle papers, will do theirs, depends chiefly on their patrons. At all events it will be at the option of manufacturers to reach trade publicity through one medium which recognizes its obligation to refrain from poisoning the public mind with expectations which are now continually hampering the free play of intelligence in the directing of trade affairs and which should have been vigorously discouraged as soon as the school days of the industry were past.

In those days every pupil in the school of bicycle making was expected at the yearly examination to prove that he had made a great bound toward earning his diploma. But "commencement exercises" were held at the 1896 national shows, diplomas were distributed, and the school days were over. The school was disbanded. Bicycle making was an industry, and the public was relieved of the obligation to pay tax for teaching the young idea how to shoot. Previously the tax had been paid, more or less cheerfully, in the form of round prices for "new models" embodying mistakes and improvements promiscuously.

Post-graduate work finds no such generous encouragement. It must pay its way. But, on the other hand, it is relieved from the obligation of making phenomenal finds at fixed intervals in its limited field of research, and should be relieved from keeping alive any burdensome and price-depressing fiction which perpetuates the obligation to make such finds.

From this harmful fiction the industry can be relieved by the method proposed without in the least impeding real progress.

The road to progress is still open, but those who claim to have advanced on it beyond their fellows must prove their claim by the tests of commerce; neither the approval of the censor, nor the admiring glances of doting mothers, sisters and aunts will avail to draw the taxpayer—the cycle buying public at large—

out of the mildly indifferent frame of mind in which he says: "That maker may be all right, but he is putting on too many frills. I think I will wait and see how he stacks up." And wait he does.

The final reward for a real improvement is not by any means diminished by this attitude of the public; on the contrary, it is increased, but mechanical tomfoolery is discouraged and a warning is implied to those who imagine that the old label, "new models," will draw extra trade beyond that which could be obtained on pure merit of goods, reputation of maker and by shrewd business methods.

### THE WHEEL AND DIP BRAZING

Poor old Wheel! If it were not so venomous it might be pitied. In its dotage it is reduced to taking up articles from the Cycle Age and finding fault with them. It blunders when it goes alone; and it blunders when in opposition. It is now damning dip-brazing a year after several of the most representative manufacturers have found it a successful working method.

So long as the Cycle Age is right, the Wheel is bound by its spleen to be wrong. The trade and its interests mean nothing to it in comparison with scoriating the Cycle Age.

Poor old Wheel! While the trade progressed the Wheel dawdled the time away in contemplation of its own greatness. The trade wanted bread. The Wheel gave it storyettes. It was its easy maxim that the besweated fellows who hang around cycle stores were the pillars of trade and of trade journals. For these it wrote, while the trade was working; working out its own salvation. The Wheel fell behind in knowledge of those serious things which now govern trade.

The Wheel's ignorance on dip-brazing is of abysmal depth. In order to make out a case against the Cycle Age, which in a recent issue presented the reasons why dip-brazing is destined to be developed into the standard form of brazing in large factories, the Wheel states that it has learned from "employees of several factories" that dip-brazing is unreliable. Why does not the Wheel, if it will presume to guide, go to headquarters for information? It quotes "one superintendent" whose experience has been unsatisfactory. This superintendent has "used the process off and on for five weeks," and "is confident the process will never prove satisfactory."

That much for the Wheel's information on a subject in which the entire industry is deeply interested. Apparently it has not the faintest inkling of the fact that several of the very largest manufacturing concerns have been employing the dip-brazing process, not off and on but steadily, for nearly two years, using furnaces of their own construction; that about twenty concerns are using the Fulton furnace, a similar number the Timms furnace, and that the Welland-Vale company have a furnace on the market adapted especially for brazing small parts. Further, the process is spreading into other industries than that of cycle manufacture.

If the Wheel knew anything of the business in which it pretends to lead, it would obtain information from those who are in position to give it. By trotting out "several employees" and "one superintendent" who knows nothing of what he is talking about, while a mass of reliable knowledge is to be had for the asking, the Wheel makes laughing stock of its pretensions and puts to the blush every cycle trade journal which may be in danger of being classed with it.

### SURVIVAL OF THE FITTEST

There have been two forms of supremacy in the cycle industry to which the retail cycle dealer has tipped his hat. The manufacturer who was supposed to strive for utmost mechanical perfection somewhat regardless of factory cost, and who claimed the right to put a special price on the product in which this perfection was thought to be embodied, has had his followers among agents as among the public. The competing manufacturer in whose efforts the financial consideration was from the start foremost, and whose declared aim it was to produce the "best value for the money," represented the other side. His work was also appreciated by the agents and the public when it seemed to be done with honest regard for

the requirements of bicycle riders. Supremacy in either of the two forms of work was held entitled to recognition as against manufacturers who aimed chiefly to produce "the best appearance for the least money."

But now, through the force of competition and progress in factory methods, the two forms of supremacy have been blended, and the endeavor of the retail dealer is directed chiefly to the none too easy task of distinguishing the vague and waving lines that separate both from the lower forms of the industry, in which the arts of enameling and of nickeling are studied with much more ardor than the science of Applied Mechanics or the "physiology of cycling."

The blending of the two best forms of manufacture is one of the outgrowths of business conditions during the year which has just drawn to its close, and is in many respects a noteworthy feature of trade. It may be denied, perhaps, that any such change has taken place or that there has ever existed any real separation between the two classes referred to. The distinction was that, however, which exists between makers of an article of luxury and makers of an article which may most approximately be classed among the necessities of life. This distinction is effaced. No manufacturer in the cycle and allied trades can hereafter afford to insist upon selling quality regardless of price; neither can he afford to ask the top price of the market for a product for which the very highest quality may not creditably be claimed. Fancy is eliminated; and this is evidenced by the announcements of policy and prices with which leading makers of both the aforementioned classes have gone on record, and by the disappearance from the trade arena of firms which were not nimble enough to gracefully drop the exclusive manufacture of high-priced machines and push the manufacture of medium priced patterns while the chance was yet open to them to maintain the loyalty of their agents by so doing.

Those who are left are now all making bicycles—bicycles of varying grades and at varying prices—but nobody is in the business of making wonderful steel idols on wheels with a view to getting more money for them than that to which a sober estimate of factory cost entitles them.

This change, being caused by finally realizing the drift of the public temper, will, it seems, be very pronounced in its effect on retail business. By bringing about a certain equality in policy it has dulled the edge of competition and brought into sharp relief those other points relating to mechanical merit, reputation, ability to make prompt deliveries, etc., by which agents as well as the public, when other things are equal, are decided to give one manufacturer the preference over another. Many makers whose goods did not stand the test of time, or who had not the factory equipment or the commercial ability to sell at a competitive price without loss, are likely to find the new conditions very difficult to cope with. They are not as likely to find retail agents to represent them as in 1897 and 1898.

\* \* \* \*

Many people are speculating upon the eventual results of the new sales policy which has been foreshadowed as the substitute for department store representation. It is said that several of the firms which followed the department store plan—and several which did not—will hereafter give territory to agents only when a certain considerable quantity of bicycles are contracted for, and that in all territories where such arrangements cannot be effected, they will market their goods through any one, two or twenty firms in each locality whose owners shall prove ready to pay the wholesale price for one or more machines. It is at the present writing purely a matter of conjecture what the result of this arrangement will be. But it seems that most business men believe that it will result in a material reduction in the number of retail agents and a broadening of the credit allowed the reduced number. The reasons given for this forecast cover a wide range and to recapitulate them would involve a lengthy review of the entire condition of the trade. The upshot of the opinion is, however, that the prophesied contraction of the industry will commence with the retail trade, and that within the near future the ablest retail dealers will find themselves in position to carry a larger and more varied stock than ever before in the history of the trade. But, concurrently with this development, it is surmised that there will be a period during which a

large number of business men who are not professional cycle dealers will carry one or two of the best known patterns of bicycles in stock in a small way for the accommodation of their customers.

\* \* \* \*

Dealers carrying side lines will do well to anticipate the proper seasons for the best sales of the various articles comprising their stocks, and as such approach the exhibition of these articles should be slightly in advance of actual needs or expectations of purchase, thus serving to remind customers beforehand of the regular return of seasonable standard goods, as well as of the presence of novelties usually accompanying them. Whenever possible, the article should be shown in the position or state nearest practical use. For instance, if a prominent side line consist of phonographs and phonograph supplies, the attached talking trumpet, ready ear tubes and displayed cylinder rolls in good number and variety of speech and song will attract attention as much by their readiness as by their presence. Such openness of display puts the customer at ease in the matter of liberty of examination, and shows the confidence of the tradesman in the excellence of his stock. A certain amount of explanation concerning side lines must be given—much without prospect of profitable realization. Explanation of the merits of an article, or an advantageous demonstration of its novelty, frequently warms the chance inquirer into actual purchase.

\* \* \* \*

A number of newspapers are reprinting, with favorable comment, a prophecy made by Sir J. Wolfe Barry to the effect that bicycles will soon be sold profitably at retail for \$5. Says the knight, who enjoys celebrity abroad as an engineer:

The present price of bicycles will not, I suppose, rule very long, and we shall see these admirable machines made at prices which now seem unattainably cheap. The weight of a bicycle is so small that the value of the material, except the india-rubber tires, cannot be serious. And if all the parts of a good machine made watch can be manufactured and put together and sold for less than \$5 the manufacture and putting together of a bicycle ought not to cost more. If we add the cost of the steel and the india-rubber, it surely seems not too sanguine to suppose that a few years hence bicycles will be sold at about a fourth of their present price,

Watches sold for the price mentioned are made by the stamping process without any subsequent finish. As soon as anything is done to produce a high degree of accuracy in a watch the price of it rises as by magic, just as in the building of a bicycle the price must remain far above the low level of cost of raw material, plus brazing and assembling, if anything at all is done to secure excellence. There is more factory cost in a well made hub than in all of the parts constituting a cheap watch.

\* \* \* \*

There is mold on this lying statement:

The Wheel, the pioneer of cycling trade journals, has the largest and broadest general circulation among cycle riders, the cycle trade and kindred trades.

Three years ago the American Wheelman had some target practice at the same mark, shot it to pieces, and the "pioneer" took to the umbrageous shelter of the woods. With the advent of the Cycle Age the eclipse of the Wheel's circulation was rendered complete.

\* \* \* \*

Whatever fate befall the cycle shows in New York and Chicago it is certain that they will be disemboweled affairs in comparison with similar functions of other years. They will lack the two things which are essential for thorough success—completeness of exhibits representative of the industry, and spontaneous support of the trade.

# THE KING IN YELLOW

The time and money expended by the dealer in popularizing the wheel he represents is capital invested.

That capital will return dividends according as the bicycle he handles shall establish its value before the people.

The bicycle is a machine that deals with complex problems of mechanics and motion. Its builders must possess a deep acquaintance with the possibilities and limitations of the art—and, knowing them, must apply them rightly.

The makers of Stearns Bicycles have studied the needs of the business—their every improvement is toward the simplifying and perfecting of the bicycles they build.

The dealer who desires to maintain a successful business will build the structure of that business upon a good and permanent foundation.

The agents for Stearns Bicycles have found in the wheel they handle the full pledge of its value.

# MILWAUKEE TIRES

PUNCTURE PROOF

**Pneumatic  
Single Tube**

**Resilient  
Easy Riding**

S. H. MEADOWS, Retail Drug Store,  
Corner VanBuren and Biddle Streets.

MILWAUKEE, WIS., Nov. 18, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.

Gentlemen: I heartily endorse your puncture-proof tires. They have proven to me to be all that you claim for them.

My wheel is used by the boys in my store in delivering packages, etc. It therefore receives a great deal more abuse than a wheel ordinarily would.

Previous to obtaining the puncture-proof tires I was greatly annoyed by the delay and expense caused by the puncturing of tires.

Since using your tires I have not had one puncture, nor a defect in them in any way. They are in first class shape today after eight months of very hard usage.

Yours respectfully,

(Signed) S. H. MEADOWS.

H. C. BOLCOM & CO., Car Shippers,  
Pacific Coast Lumber, Red Cedar Shingles.

WINONA, MINN., Nov. 23, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.

Gentlemen: Am pleased to recommend your puncture-proof tires. They are the Real Thing. Make it as strong as you like.

(Signed) N. M. BOLCOM.

EVANSTON, ILL., Dec. 10, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF  
TIRE Co., Milwaukee, Wis.

Gentlemen: In reply to your letter of Nov. 30th, I beg to say, that your tires which I purchased some time ago look today as good as new.

An Ajax wheel, which I have fitted with a pair of your Milwaukee Patent Puncture-Proof Tires, makes a wheel fit for a king.

Yours truly,

(Signed) NELS. SWANSON.

NEWPORT NEWS, VA., Dec. 16, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.

Gentlemen: I take pleasure in stating that the Milwaukee Puncture-Proof Tires have given me no trouble at all as regards punctures. They are undoubtedly Good Tires.

I am highly pleased with your tires. They are far superior to any others I have ever ridden, and I do a great deal of riding as I am collecting for a furniture house.

Very truly yours,

(Signed) E. P. BUXTON.

## FAST FREIGHT vs. EXPRESS

### Many Dealers in Large Cities Steadily Have Their Goods Shipped by Fast Freight

Unusual interest is being displayed by cycle dealers in the effort to compel express companies to moderate their extortionate charges. The proposal to use the fast freight as a substitute for express is unhesitatingly approved by traders in large cities, but agents in small towns are prohibited from solacing themselves with more than the hope that the liberal extension of and reduced rates for parcels post will work powerfully for reform in their behalf.

Herewith are presented some opinions recently received from readers of the Cycle Age, which furnish conclusive evidence of the hardships endured under the prevailing methods of expressing cycle merchandise:

#### Express Charges Never Decrease.

The express charges are beyond reason and any help I can give I will be only too glad to extend. I am a small builder of bicycles and my capital necessitates my buying in small quantities. I have to figure on at least 10 per cent for express. Again, I have to compete with factory-made machines, and, as good bicycles are built today as cheaply as they can be built, we cannot afford to pay as much express as when a bicycle was bringing \$75. There are points against fast freight, one of the most important of which is the delivery system. The freight arrives at the depot and then there is liable to be a delay if we do not keep close watch of the depot, whereas the express companies always deliver at once. I think the express companies charge for the risk they run in carrying on their business, but they charge just as much for a pair of rims as they do for tires, the risk being only about one-tenth as great. The rims are only worth 40 cents, while the tires are worth \$4.

As long as we sit still and pay, the express companies are not to blame altogether. But if we ask them to make the charges right and in proportion to the value of bicycles, and they still insist on adhering to their old prices, I am in favor of organizing and boycotting them entirely and patronizing fast freight.

Lansing, Mich.

F. L. HOLMES.

#### Present Freight System Is Poor.

We are pleased to note that there is a movement on foot to substitute a fast freight system in the place of express. It will certainly meet with the approval of the majority of shippers and tradesmen. The average business man is perfectly willing to pay reasonable transportation rates and to pay well for fast and prompt service, but when the rates are such as to net the transportation companies a profit of 80 per cent on the actual investment, this fact alone would tend to remove any doubt as to the exorbitant proportions of the present express rates. The arbitrary position which the express companies took with regard to compelling shippers to pay the necessary revenue on shipping bills, even after the courts had decided against them, certainly made them no friends, but on the other hand placed them in disfavor with every shipper in the country. So far as service rendered on the part of the express companies is concerned, this has been satisfactory to us with one or two exceptions. In one instance, after waiting two or three days over the usual time, we found the goods in question stowed away in the warerooms of our local express company.

The present freight system we have found extremely poor, it having taken in some instances ten days' time to get goods by freight from Dayton, O., to Minneapolis. Unless the present freight system can be greatly improved the dealers will doubtless continue to use express, especially through the busy season.

The matter of inaugurating a more satisfactory system of transportation for the general welfare of shippers and tradesmen is certainly commendable on the part of its promoters and of those who are pushing it along. We believe that it would be an excellent plan to place this matter before the various business men's organizations of the large cities, such organizations being composed chiefly of merchants and tradesmen

who would readily see it to their interests to assist any movement in this direction.

The Commercial Club of Minneapolis is an organization which is always ready to lend its support towards the promotion of any plans that tend to be beneficial to the city and the community at large.

Minneapolis, Minn. HAYNES-TRUSTY CYCLE CO.

#### Express Carriers Are Mean.

The express companies have taken half of our profits in the last three years, and we have often thought if there was some way of getting our supplies almost as quick with less charges we would do all in our power to make such a method a success. We are more than satisfied with the idea of fast freight. The express companies are the meanest people we have ever had any dealings with. We are more than in sympathy with the movement started in New York to compel these carriers to moderate their charges.

Pontiac, Mich.

BEATTIE BROS.

#### Sample of Trickery Practiced.

I am heartily in sympathy with the movement to make the express companies moderate their charges. I will give you a fair example of the way I have been treated by the express companies. I sent a tire casing to Chicago, and the charges were 25 cents. For some reason the case was not repaired, and it was returned to me in the same condition as I had sent it. But when I received it the charges were 30 cents instead of 25 cents. This I have had happen to me more than once. I asked the driver to explain, and he said that the package was heavier than when I sent it. When I had the same thing happen again I asked the manager of the express company to explain, and he said that it must have been weighed incorrectly. I told him that it was rather strange that the error should occur so often and never be corrected, and he did not have anything to say.

Detroit, Mich.

E. J. BURRELL.

#### High Charges on Small Packages.

I think the express charges on small packages are very unreasonable. Packages which would not cost over 15 cents at one ounce rates are made to cost from 25 to 30 cents. The repairmen and small dealers have little or no chance to handle goods at the same prices as the department stores, for their profits are eaten up by express charges, goods being ordered just as needed. I have often had to wait a week to get goods from Chicago when four days would be ample time for transporting them. There is something wrong either with the people that sell the goods or the express companies—perhaps both.

Wabash, Ind.

WILLIAM BROWN.

#### Masters of the Situation.

We have but one express company in this place, and their charges are made according to distance from pay day and the state of their bank account. One day they will charge 25 cents and the next day 40 cents, same distance and weight, and in case a crated bicycle is shipped, charges are from 40 to 70 cents, same distance and weight. In one case last summer they collected three charges on one package, with one return charge, afterward returned or remitted, one charge to consignor, but no return charges. They have also delivered c. o. d. packages shipped by me without making collection and have now been six months trying to trace it. These are only a few of the many cases that could be cited.

Alliance, Ohio.

CHAS. S. KEITH.

#### Use Express Only in Emergency.

For some time we have given up shipping wheels by express, except in extreme cases when it is necessary to get the goods on quick time. We will be pleased to help in getting a rate on all bicycle goods by express that will be right.

Port Huron, Mich. BEARD, GOODWILLE & CO.

#### Charges Are Variable.

I am certainly in sympathy with the movement to compel the express carriers to moderate their charges. I am in favor of using fast freight as I can get goods pretty near as quick. The Adams is the only ex-

press company that comes into Lexington, and I get it stuck to me every once in a while by them. Recently I had two bicycles come from Chicago by express. They had them charged \$2. I kicked, for I had got two for \$1.70. I paid the amount, but went to the company and made another kick, and they said I had been charged too much and they refunded the 30 cents. About two weeks later I had two of the same models of bicycles that weighed the same. They charged me \$2 and would not correct the matter. I have cases like this all the time. The other day I sent a front fork to Chicago, minus the stem. It came back with a new stem and weighing a good deal more, but it cost me 5 cents less for express charges. It was 30 cents going and 25 cents returning.

Lexington, Ky.

C. O. UPDIKE.

#### An Outfit of Robbers.

I certainly am in favor of the movement to compel the express companies to moderate their charges. The proposal to use fast freight instead of express meets with my approval. I think the express companies are an outfit of robbers, and many is the time I have paid them more express than the article was worth.

Manchester, Iowa.

J. R. TOOGOOD.

#### Falling Prices; Steady Express Charges.

I specify to ship by freight in most of my orders, excepting small ones. I find that shippers do not like to ship by express on account of the extra expense. The express companies are surely getting all they can. It is a fact that on all small articles used in the construction of bicycles the express bill is larger than that of the material. I think it is high time for the express companies to revise their scale of prices so as to keep pace with falling prices. There is but one way to make them realize this and that is to ship by freight.

Saginaw, Mich.

GEORGE FISCHER.

#### Says Reform is Impossible.

We are very large shippers by express, and have felt that the charges in many cases were excessive. No one would be more pleased with the reduction than ourselves, but we have little faith that it will ever be accomplished. So far as fast freights are concerned, we understand that the express companies pay a certain percentage to the railroads for handling their business, and this connected with the fact that the leading trunk lines are owned by the Vanderbilts, who also own large blocks of stock in the express companies, will make it impossible to accomplish anything along this line. The position the Cycle Age has taken in this matter is admirable, but we feel that its work can accomplish but little although we are in sympathy with it. These matters should be handled by legislation, but the legislators are always with the express companies and other corporations, and the reason is obvious.

Flint, Mich.

AMERICAN MACHINE CO.

#### Irreconcilable Express Charges.

We recently expressed a pair of gun barrels to Syracuse, N. Y., at a cost of 96 cents, with 25 cents extra charges at the other end. Also received one pair of racing rims from Plymouth, Ind., missent to Chester, Iowa, for which we were charged 75 cents express. From this you can plainly see that we are in sympathy with the movement started in New York. Fast freight meets with our approval. Our patronage of the express company has been very limited since the revenue stamp act.

Creston, Iowa.

MYERS & EDABURN.

#### Express Charges Eat Up Profits.

We are in perfect sympathy with the movement for the reduction of express charges, and approve of fast freight instead of express. We know of several cases where exorbitant express charges have eaten up the profits, and it is also noticeable that these charges fluctuate. This seems singular to us, as we suppose it does to others. Every retail merchant should give his hearty co-operation to this movement. We shall read with interest the progress of this movement through the Cycle Age, and hope that it will cause the revolution required.

Colfax, Iowa.

KIZER BROS. CYCLE CO.

#### Heavy Express Bill for the Year.

The Cycle Age's agitation to moderate exorbitant express charges meets our most enthusiastic approval. If the telegraph and express companies could be compelled to charge in proportion to the service rendered, we would all be a great deal better off. Our express bill is something horrible to contemplate, when viewed in its annual total. The unwillingness of the express companies to stand the brunt of the new revenue law is

an example of their greed. We are most heartily in favor of combining to bring about a compromise at least regarding the charges they make. The simple fact that they are rolling in wealth and declaring tremendous dividends every year is enough evidence that the charges they make are much greater than they should be.  
Des Moines, Iowa. THE W. B. CHASE CO.

#### In the Hands of the Oppressors.

I am in favor of the movement started in New York to compel the express companies to moderate their charges or use fast freight. Making customers pay the stamp charges imposed on the express people by government, the express companies using such widely different business methods—as between us using exclusive offices and those who do the same business through competitive offices—are the main complaints I would make in addition to heavy rates.  
Fayette, Iowa. GEO. A. HOOVER.

#### Exorbitant Charges on Less Than 100 Pounds.

We are in sympathy with the movement started to compel the carriers to moderate their charges. The proposal to use fast freight instead of express meets with our approval. We have to submit to exorbitant charges on less than 100 pound packages.  
Champaign, Ill. CHAMPAIGN CYCLE CO.

#### Rough Handling by Express.

Apparently I have always been a mark for the express companies. In the six or seven years I have dealt in bicycles I have failed to get one machine in as good condition as when it left the factory. I have just mailed a letter to a Chicago firm, asking them to wrap the tubing in corrugated paper, and build crates stronger to stand the abuse they are subjected to in transportation. In the case of a tire sent to be replaced, I have paid as high as 80 cents, very nearly half the cost of tire. If the express companies break your stuff up they will, may be, carry one way free, but you will have to stand the balance, as you will have no other redress. Fast freight would meet with my approval.  
Battle Creek, Mich. O. G. PENDILL.

#### Carriers Should Affix Revenue Stamp.

We are in sympathy with the movement started to compel the express companies to moderate their charges. Fast freight will meet with our approval. The practice of the express companies to make the people pay the revenue stamps on all their receipts should be stopped if possible.  
Frankfort, Ind. CLINTON CYCLE CO.

#### No Telephone Service.

We are in sympathy with the movement started to compel express companies to moderate their charges. The proposal to use fast freight instead of express meets with our approval. In this town of 7,000 the American Express Company is too "poor" to put in a telephone. Unless one is on the main street every time he wants to send a package, it is necessary to run to the office.  
Rochester, Minn. IRVING W. FOX.

#### Heavy Overcharge.

The express rate on 100 pounds from this point to or from Chicago is \$1.75. I had — wheels shipped from the Calumet Cycle Co., and the express charge was \$100. At that rate I was charged \$4 for 100 pounds. We have only the one road here, but would be glad to see the price put where it belongs.  
Merrill, Mich. JOHN WALKER.

#### Express Rates on Bicycles Too High.

We are greatly in favor of reducing express rates on bicycles and goods belonging to them. They are and have been one of the most paying articles for past years, and the carriers cannot afford to turn us down. On the other hand, we can afford to stand the decrease in charges arising out of the use of fast freight.  
Lexington, Ky. LEXINGTON BICYCLE WORKS.

#### More Powerful Than the Government.

We are heartily in sympathy with the movement to regulate charges of the express companies. They have shown themselves more powerful than the government in refusing to pay their small proportion of the war taxes, and now a strong united effort should be made to regulate their charges on a fair basis for all.  
De Soto, Mo. CUNNINGHAM & HAMEL.

#### Heavy Bill for Express Service.

We think that some measure should be taken to relieve us of oppressive express charges. The matter of 25 to 30 cents for a single package does not of course, amount to much, but in the bicycle business, when

receiving 20 or 30 packages a day, in a year it amounts to a very large bill. We have taken advantage of fast freight whenever we could and found it very satisfactory. We hope through your valuable journal that something to our relief may be brought around.  
Jackson, Mich. DENNIS MACHINE CO.

#### Trouble With Shipments From the East.

My experience in shipping from eastern points teaches me to order a year ahead of time, and let the goods come by stage route. In ordering keys or wire to fill stock, from Connecticut points, the express charges sometimes amount to as much as stock costs. I do not think any paper in a Christian country would print my full views on this subject. I just say what I know.  
Peoria, Ill. D. S. KENT.

#### Express Charges Equal Cost.

I am in sympathy with the Merchants' Association of New York in its effort to reduce express rates. I am also in favor of fast freight instead of express. I often get small parts on which the express charge is almost as much as the cost of goods. I sometimes think that they size up the package and put the express charge low enough so that I will take it from the office.  
Huntington, Ind. J. H. KINDIG.

#### Charge About 15 per cent of Cost.

Kindly listen to our little tale of woe. The express companies, it seems, are trying to get as much of our profits as they can and we are heartily with the Cycle Age in giving them a good calling down. We favor fast freight. Only last week we paid 35 cents for one pair of 24 inch tires wrapped in paper, and one set of frame fittings cost 40 cents, less bar, pedals and axles. These goods came from Chicago. Two packages of frame fittings from Buffalo cost each \$1 and \$1.25 respectively. We find that the express companies charge us about 15 per cent of the value of our goods.  
Peoria, Ill. PEORIA CYCLE & SUPPLY CO.

#### Makers Should Not Use Express.

We have recently ordered all goods sent by fast freight unless parcels are too small, and them we order to be sent by mail. We have no further use for express companies as they now exist. Manufacturers should send goods by freight unless otherwise ordered, instead of vice versa.  
Webster City, Iowa. SMISOR BROS.

#### "Lead Pipe Cinch Monopoly."

We have a great many complaints to make regarding the exorbitant express charges. We are in every instance using Merchants Dispatch. Fast freight is certainly the most profitable. The express companies seem to us to perfectly represent the "Lead-Pipe Cinch Monopoly."  
Indianapolis, Ind. C. G. FISCHER & CO.

#### Complain of Extortionate Charges.

We are in sympathy with the movement to compel the express companies to moderate their charges. The proposal to use fast freight instead of express meets with our approval. We complain of the extortionate charges.  
Minneapolis, Minn. GREAT WESTERN CYCLE CO.

#### Ready to Join in the Fight.

We think the express rates are very exorbitant, and the proposal to use fast freight meets with our hearty approval. We have been obliged to have a great many wheels come by express during the past few years and on account of their charges our margins have been cut materially. We shall be glad to join in the fight for lower rates.  
Minneapolis, Minn. SMITH & ZIMMER.

#### Practical Solution to the Trouble.

The movement started to bring the express companies to time is worthy of support. However, a good service of fast freight is probably the most practical solution of the trouble, as it would be fast enough for all bicycle deliveries and at the same time would be a blessing to all other lines of business.  
Downington, Mich. GEO. E. PAIGE.

#### Immense Saving in Fast Freight.

We are heartily in sympathy with the movement to use fast freight instead of express. We used only the fast freight from Chicago for the last four months, the difference in time has never exceeded 16 hours. The saving has been immense.  
Owensboro, Ky. JOHN G. DELKER.

#### Get Everything Possible by Freight.

We are in hearty sympathy with any movement which will compel the express companies to reduce their very extortionate

charges. We are in favor of fast freight every time, as we firmly believe this is the only remedy to bring the express companies to time. We have for some time shipped everything that we possibly could by freight, preferring a few days' delay in order not to be compelled to pay outrageous express charges. Unless our customers insist on it, we never have anything come by express that we can get by freight.  
Le Mars, Iowa. HAAS & HUEBSCH.

#### Approve of Fast Freight.

We are heartily in sympathy with the movement started to compel the express companies to moderate their charges. We are in favor of any mode of quick transportation that will take the place of express.  
Grand Rapids, Minn. W. J. & H. D. POWERS.

#### Strongly Favors Fast Freight.

I heartily endorse any movement to put down the exorbitant charges that retail dealers have had to pay the express companies. This is something that has been very annoying to me, and I presume that every dealer in the country has had the same experience. I am strongly in favor of fast freight.  
Ashville, Ohio. C. F. BRINKER.

#### All Goods Sent by Freight.

Practically all of our goods go by freight. We, of course, are interested in any movement that would tend towards reduction of express charges, and the Cycle Age will have our hearty co-operation in anything that is done.  
Minneapolis, Minn. DEERE & WEBBER CO.

#### All Goods Received by Freight.

I am in sympathy with the movement to compel express companies to moderate their charges. Fast freight and postal express suit me. For over a year I have ordered all possible goods by freight, and shall continue to do so unless there is a great change in express rates.  
Atwater, Ohio. E. H. HINMAN.

#### No More Business by Express.

I approve of any system of transporting goods which will put an end to the extortionate charges of the express companies. The express company charges here have been something awful, and I do not intend to give them any more business than I can possibly help hereafter.  
Menominee, Mich. D. F. FOYER.

#### Splendid Service from Fast Freight.

We are in thorough sympathy with any movement tending to reduce express rates. We have had splendid service with fast freight during the past season, especially from Chicago, and believe it the best means to make the express companies reduce their extortionate rates.  
Kansas City, Mo. E. P. MORIARITY & CO.

#### Fast Freight Good and Cheap.

We certainly favor the fast freight proposition. We can see no reason for the existence of the express companies, and have always maintained that the railroads could give just as good service at much less cost. Complaints against the express companies are too numerous to specify, and we hope that the movement will be a success.  
Sibley, Iowa. WALTON BROS.

#### Using Freight for Two Seasons.

We are most emphatically in favor of any combination or scheme whereby the express companies can be brought down to a legitimate basis in the matter of charges. We have been using freight for the last two seasons almost exclusively, suffering considerable inconvenience thereby, rather than patronize express companies. Sometimes we have been able to get bicycles from Chicago in three days by freight. Express runs from a day to a day and a half. We deplore the fact that the express companies evade the law in regard to the matter of revenue stamps.  
Bridgeport, Ohio. HALL & ENLOW.

#### Permanent Fast Freight Service.

Am not in sympathy with any movement to interfere with express companies' business. Have no complaints to make. Would be heartily in favor of permanently established fast freight service, and believe it would be liberally patronized by the bicycle trade.  
Marshalltown, Iowa. H. S. THURBER.

#### Lower Postal Merchandise Rates.

We are in hearty sympathy with any movement which will compel express companies to radically modify their present extortionate rates. We approve of the use of fast freight wherever possible. Our congressmen should be urged to secure a revis-

ion of postal rates on merchandise, making the rate not more than 8 cents per pound, instead of the present 16 cents. We believe that such a reduction would compel express companies to reduce their rates, at least on small packages. We are certainly pleased to see Cycle Age throwing its influence against the transportation pirates. We shall be pleased at all times to render whatever little assistance lies in our power to aid in the work of a thorough revision of the express rates.

Minneapolis, Minn. NORTHERN CYCLE SUPPLY CO.

#### Avoid Shipping by Express.

Out here it is most outrageous the way the express companies "sock" it to us when we cannot help ourselves. The only thing for us to do is to avoid the express companies as much as possible and keep out of their clutches. If the charges were more reasonable, we could patronize them more freely.

Chatfield, Minn.

FRANK UNDERLEAK.

#### Express Adds Greatly to Cost.

The proposal to use fast freight instead of express meets with my approval. At times express has not proven to be satisfactory. Often it happens that the article received by express is very expensive after the charges are paid. The fast freight proposal is all right.

Decatur, Ill.

PAUL HIEKISCH.

#### Prefer Fast Freight to Express.

We stand ready to do what we can in bringing about more reasonable express charges than are now made. We prefer fast freight, if we could get anywhere near the service given us by the express companies. If the information given in the Cycle Age is correct, we see no reason why these companies should not be willing to give the public service at a much reduced figure.

Flint, Mich.

FLINT BUGGY CO.

#### Consignors Have an Advantage.

We are in favor of fast freight. Express charges are too high. Sometimes the express charges are equal to the value of the article purchased. Sometimes the firms from whom we buy pay the express in advance for us, and in that way we get it for 18 cents—the other way it costs us between 25 and 35 cents.

Monticello, Ind.

STAR BICYCLE CO.

#### Approve of Fast Freight.

We are in sympathy with the movement started to compel carriers to moderate their charges. Fast freight meets with our approval. Express companies should pay the revenue tax and reduce rates. We trust that this movement now on foot will bring about the reform sought.

Lansing, Mich.

J. G. GROSS & CO.

#### Express is Convenient But—

Our express service certainly is preferred as to convenience, but heavy charges are very objectionable, and we certainly are in sympathy with the movement to have the charges moderated. We approve of fast freight.

Peru, Ind.

PERU CYCLE EXCHANGE.

#### New Puncture Proof Tire Company.

The Rochester Non-Puncturable Tire Company has been organized by a number of Rochester capitalists for the manufacture and sale of a new bicycle tire, the tread of which is made impervious to any kind of pointed instrument by means of small transverse steel plates riveted to a band encircling the periphery of the air tube. These plates lie between two layers of cotton webbing which prevent contact with and consequent wear of the rubber. The rubber tread or outer jacket is removable and can be replaced at small cost when worn out, while the tire proper will last indefinitely, it is said. Manufacturing has already begun, but preparations are being made for the establishment of a larger plant, enabling an increased output to meet the anticipated demand for this new invention.

#### Further Humber Reductions.

The English cycle trade was somewhat startled recently when the Humber company announced that the English Humber would retail at a few cents over \$50, but the Humber company has not stopped at the above figure and to meet the price

cutting of another prominent English concern has made a further cut of about \$12, bringing the price down to \$38.72. This price is on the Coventry Standard grade of Humbers and includes an equipment of Westwood rims and "A. B." tires.

#### THE PARIS CYCLE SHOW

##### Absence of English Exhibitors Causes Comment—American Firms Represented.

The recent Paris cycle show has seemingly demonstrated that the English cycle trade in Paris has practically ceased to exist. Whereas four or five years ago the majority of the exhibitors at the Salon du Cycle were English, and the larger part of the cycle dealers in the Parisian capital's cycle row, the Avenue de la Grand Armee, were of the same nationality, this year but one English cycle maker exhibited at the cycle show and but one or two English bicycle stores now remain among the dealers of the "row." At the show, however, were to be found several English concerns in the tire and accessories departments.

The English makers claim that the French machines are not up in a mechanical way to the standard of British product, and that ideas long since discarded in England are still in vogue in the gay capital across the channel. Among the points noted by the English makers as not being strictly modern were fork crown designs, cranked rear forks, and the failure to fit gear cases to all machines. The English trade, while it deplores the fact that it has lost its hold on the Parisian market, is agreed that there is still a field if the desires and styles of the Frenchmen are but studied and the English machines sent to Paris made with a view to meeting these demands and at the same time furnishing better quality of workmanship than is now displayed in the French cycles. The English tradesman considers the French cyclist a peculiar being. The director of a large English lamp firm which has a branch in Paris recently voiced that opinion when he noticed a French rider passing with a Chinese lantern slung from his handle bars. Said the Englishman: "How the dickens can we pay a dividend when they use things like that?"

Though the English maker was more prominent by reason of his absence than his presence at the Paris show, the American was in rather conspicuous evidence. The American firms represented were the Pope Manufacturing company, H. R. Lozier & Co., the Crawford Manufacturing company, Western Wheel Works and the Indiana Bicycle company.

#### Proposes to Manufacture Pegamoid.

Efforts are being made in Springfield, Mass., to organize a company with a capitalization of \$20,000 for the manufacture of "a new style of celluloid veneer"—probably pegamoid. Charles F. Church, of New Jersey, who has installed several plants in eastern factories for enameling bedsteads, bicycles, etc., has been conferring with the Springfield board of trade and with capitalists there, and has met with much encouragement. The intention is to form an incorporated company for the purpose of making the stuff to sell to cycle manufacturers, carriage makers, car builders, etc. The company will start in a conservative way, employing about twenty hands and occupying temporary quarters with a view to removal when business warrants.

#### Cease to Job Bicycles.

Baker & Hamilton, the large San Francisco jobbing firm which has for several years handled bicycles on a large scale on the coast, have announced that they will sell no more bicycles. Last year

they sold between 4,000 and 5,000 cheap machines, so their retirement will mean a large trade to be divided between the makers and agents of a higher class of goods. The reasons given for abandoning the sale of bicycles is that "A number of manufacturers have so reduced their lists as to make it unprofitable for the agent to handle bicycles, the cost of selling the cheaper machines being as great as that of selling the higher priced ones." The firm will, however, continue to job a complete line of sundries, repair outfits and material and one line of tires.

#### AMERICAN AND ENGLISH EXPORTS

##### Shipments From New York for One Week Almost Double Those From Great Britain.

Exports of bicycles and bicycle materials from the port of New York for the week ending December 27 are recorded as follows:

Countries—	Bicycles.	Material.
Germany . . . . .	\$ 7,094	\$15,493
England . . . . .	13,869	2,394
France . . . . .	7,324	.....
Australia . . . . .	9,272	2,509
Sweden . . . . .	2,213	1,125
British West Indies . . . . .	2,724	1,124
British East Indies . . . . .	1,871	475
British Guiana . . . . .	1,965	266
Denmark . . . . .	377	2,041
Belgium . . . . .	30	1,266
Italy . . . . .	395	578
Dutch West Indies . . . . .	222	.....
Mexico . . . . .	205	.....
Central America . . . . .	123	.....
Africa . . . . .	100	73
Scotland . . . . .	100	.....
Brazil . . . . .	45	.....
Cuba . . . . .	96	.....
Ecuador . . . . .	38	.....
Haiti . . . . .	30	.....
United States of Colombia... .	20	.....
Porto Rico . . . . .	14	.....
Totals . . . . .	\$48,127	\$27,344

The value of the exports of bicycles and materials from Great Britain for the week ending December 17 is recorded as follows:

Adelaide . . . . .	\$ 1,365
Alexandria . . . . .	300
Bombay . . . . .	1,085
Bordeaux . . . . .	300
Bologne . . . . .	1,850
Buenos Ayres . . . . .	150
Calcutta . . . . .	1,725
Cape Town . . . . .	4,290
Christchurch . . . . .	1,005
Cologne . . . . .	50
Demerara . . . . .	375
Durban . . . . .	1,915
East London . . . . .	645
Flushing . . . . .	2,380
Fremantle . . . . .	835
Hamburg . . . . .	250
Hong Kong . . . . .	275
Lyttleton . . . . .	1,980
Madras . . . . .	100
Malta . . . . .	240
Melbourne . . . . .	12,925
Newcastle . . . . .	70
Ostend . . . . .	225
Otago . . . . .	240
Penang . . . . .	230
Perth . . . . .	200
Port Elizabeth . . . . .	1,630
Rangoon . . . . .	100
Singapore . . . . .	1,190
Sourabaya . . . . .	510
Sydney . . . . .	450
Toronto . . . . .	100
Trinidad . . . . .	305
Wellington . . . . .	660
Zanzibar . . . . .	130
Total . . . . .	\$40,095

#### The Lovell-Johnson Controversy Ended.

The case of Lovell vs. Johnson in the patent infringement controversy between the Lovell Arms company and the Iver Johnson Arms & Cycle Works, which has been stubbornly contested in the courts for several years, was decided last week in the court of appeals, the judge rendering a verdict in favor of the defendant.

The minister of war of Belgium has just issued a decree providing for the formation of four companies of military cyclists from the regiment of carabinieri. Each company will be provided with 125 folding bicycles.

## COMMERCE IN FOREIGN MARKETS

### OUR TRADE METHODS ARE INFERIOR

Abroad we are poor traders. It is the opinion of one of the smartest men in the American consular service. The truth of this belief is emphasized every day in correspondence with American merchants and manufacturers and in observations of the way they are handling the new export trade and their endeavors to get into it. American export trade is rolling up like a snowball because of a 50 per cent superiority in manufacturing knowledge and natural resources, and despite a 15 to 30 per cent inferiority in trading knowledge, a heavy percentage of unwillingness to learn foreign trading customs, and a still greater percentage of lack of foreign merchant facilities and organization. If a small portion of the vast sum of money in the United States now seeking investment could be employed in some form of export scheme to handle American goods, we would soon be able to record a greater export of American goods than of the raw products of the soil, though to-day we are boasting of an excess of manufactured exports over the manufactured imports.

### OUR INTERESTS IN CHINA

China wants her communications to be opened up, her industries organized, her hidden wealth brought to the surface, her natural products utilized. As according to the traditional order of procedure of the English-speaking races, the enterprise of the people precedes and draws after it the protection of their governments, it follows that the infiltration of capital and skilled direction into China is the proper lever by which the governments of Great Britain and the United States may be moved to interest themselves actively in the welfare of that country. Only by such a policy can the predatory powers be kept from ravaging the country and precipitating anarchy and red ruin among the largest population on the face of the earth. Every line of railroad, therefore, every factory in China, under either British or American auspices, is a solid gain to the whole commercial world. It is "effective occupation" of the genuine kind, the only kind of occupation that will save the territory from being staked off into exclusive areas, that will keep the door open for the free intercourse of all nations. Consequently, the concession of a railroad between Canton and Hankow to an American syndicate is an event of happiest augury.

### SOMETHING WRONG SOMEWHERE

Certainly there is something wrong somewhere in the training and education of Englishmen, otherwise the British board of trade could never have issued such a report as the one recently published, on the causes of the decay in British trade. In this memorandum are summarized the reports of 116 diplomatic and consular agents in all parts of the world. One and all tell the same story. The English are being beaten everywhere in markets that were once theirs, because of pride, stupidity and lethargy. Germans and Americans are cutting them out everywhere.

Excessive arrogance and smug self-complacency, qualities which have so long made the English detested by their neighbors, are now exacting their penalty in the way of business. The British traders despise the foreigner, and if he will not

take what is offered him he is let go elsewhere; and as a consequence he has gone elsewhere. Rivals have none of this stupid pride about them. If a foreigner wants to have anything in his style they are humble enough to try and let him have what he wants without elaborately making him feel that he is a condemned fool for not preferring the British fashion. The board of trade memorandum might appropriately be issued as a sermon preached by the representatives of England abroad from the familiar text, "Pride goeth before destruction and a haughty spirit before a fall."

### RIVER FREIGHT RATES IN GERMANY

It is of considerable value that exporters should have knowledge respecting transportation facilities between the seacoast and the large inland cities in Southern Germany. Railway communication between these cities and Hamburg, Bremen, Antwerp and Rotterdam is very good; but river transportation is less injurious to freight, at the same time giving the shipper rates varying from 25 to 75 per cent less than the railway charges, depending upon the condition of the river and the character and class of goods shipped.

Merchants are in the habit of purchasing from the wholesale dealers in one of the larger seacoast cities, and after the railway freight rates have been added to the large commissions demanded by the wholesale houses, such high prices must be asked for the goods when they reach Mannheim that sales are slow. If American exporters will deal directly with the German importer and retail dealer, many of the popular prejudices now existing against our goods will be removed; the wares can be purchased at first hand and without the payment of high commissions, so that the retail dealers can dispose of them at prices within the reach of the average purchaser and yet make a handsome profit.

It is for this reason that low transportation charges figure very largely in the estimate of what goods can be sold for, so as to compete favorably with German product. The Rhine and its tributaries penetrate regions quite remote from the sea, while many canals ramify the country and connect with foreign water ways.

The following is a table of river steamer freight rates between Rotterdam and the chief Rhine ports:

	Miscellaneous parcels, etc.	Consignments of 5000 lbs. or more (11,023 pounds).....
	Cents.	Cents.
Between Rotterdam and—		
Emmerich . . . . .	15.4	14

Coblenz . . . . .	23.8	22.6
Bingen, Rudesheim . . . . .	23.8	22.6
Bieberich, Mainz . . . . .	23.8	22.6
Oppenheim . . . . .	26	24.9
Worms . . . . .	28.5	27.1
Ludwigshafen, Mannheim . . . . .	28.5	27.1

### TO HELP OUR EXPORT TRADE

It is evident that the national exposition designed to foster American export trade, which is to be held in the autumn of this year, under the auspices of the Philadelphia Commercial Museum, will not want for financial support. The national government has given the en-

terprise its sanction and support. Congress has just made an appropriation of \$350,000 on behalf of the exposition. The city of Philadelphia has voted to the Museum \$200,000, and the state of Pennsylvania \$50,000. An additional amount sufficient to guarantee the success of the enterprise will be raised by private subscription.

### VERY LIGHT MACHINES FOR SPAIN

The bicycle trade is, comparatively speaking, in its infancy in Spain, but the demand for machines is yearly increasing from all parts of the country. It is estimated that about 2,000 machines were sold during the last twelve months, of which about one-third were of British origin; the rest came from France, Germany and America. There is a demand for very light machines. The continental makers do all they can to push the sale of their machines by establishing branch houses, advertising extensively, and by arranging professional riders to appear at races on machines made by their employers. British firms, on the other hand, will only deal with their agents as merchants, that is to say, the agent must buy their machines out and out and bear all the expense of advertising, etc. Very few machines are made in the country itself.

### CONCERNING FOREIGN CREDITS

Both the English and the American manufacturer expect to be paid in sixty or ninety days. The merchants in Oriental, Oceanic and African ports, and in parts of Europe also, expect six months' and nine months' credit, and sometimes more than that. These credits can generally be obtained from German, Belgian and French manufacturers. Of course the price must cover the interest for this longer period, but these continental manufacturers manage to make it pay them to give the customary credits. The seller must know the buyer pretty well to allow such credit, and here the continental manufacturer seems to have the advantage over the Englishman and the American; he has more agents of his own nationality in foreign parts and he knows better whom he can trust.

### CYCLE MANUFACTURE IN ITALY

Many bicycles are made in Italy, though tubes, balls, chains and saddles are imported from England and America. Gear cases are seldom used. The English first-class make of machine is preferred to those of Italian manufacture, but the difference in price being so considerable, there is little trade done in them. American-made machines, on the contrary, which are comparatively cheap, are much used. In imports an increase over the preceding year is noticeable, and the exports, with few exceptions, have also increased or maintained the average. Cycling has become very popular at Spezia. There are now six depots where cycles may be hired at very cheap rates. The machines are mostly of Italian and German manufacture.

One of the exhibitors at the Paris cycle show just concluded stated that bicycles for the French, English and German trade are fitted with entirely different saddles and tires, the French preferring a light, the English a medium, and the German a heavy weight article in each.

# MENACE TO EXPRESS SERVICE

## Lower Parcel Post Rates and Increase in Weight Limit Asked from Congress

It is generally believed that lower domestic parcels post rates on merchandise will greatly relieve shippers and the public at large from the burden of extortionate charges which are now imposed by the express companies. It is not expected that this agency alone will afford thorough relief, but with its ally, the fast freight, which is now in such high favor among shippers and traders in large cities and towns, splitting business with the express companies it is reasonable to indulge in the hope that the tyranny so pitilessly carried is rapidly nearing its end.

### Lower Parcel Post Rates

Congress is being memorialized to authorize the transportation of domestic merchandise throughout the country by means of the postal service at rates at least equal to those enjoyed by the people of Great Britain, to which there can be no objection unless it be that the average haul in this country is somewhat longer than in the United Kingdom. In this view, slightly higher rates than those current in Great Britain might be imposed. It is also demanded that the weight limit for packages suitable for transmission by parcels post be increased from 4 pounds to 11, which latter is the weight limit of parcels sent through the British mails.

### Comparing British Rates With Ours.

Parcels post rates in Great Britain are 6 cents for the first pound, and 2 cents for each additional pound, up to 11 pounds, while the rate on merchandise in this country (limited to 4 pounds), with some exceptions covered by second and third class matter, is one cent for each ounce or fraction thereof. The disparity between the parcels post rates of this country and those of Great Britain may be readily seen in the following table of comparative rates for domestic parcels, assuming that the present weight limit of four pounds in the United States be increased to eleven pounds.

Lbs.	United States.	Great Britain
1	\$0.16	\$0.06
2	0.32	0.08
3	0.48	0.10
4	0.64	0.12
5	0.80	0.14
6	0.96	0.16
7	1.12	0.18
8	1.28	0.20
9	1.44	0.22
10	1.60	0.24
11	1.76	0.26

### Mercantile Interests Neglected.

It has been the custom of the Post Office Department for years to carry newspapers, periodicals, books and commercial literature as second class mail matter—with no weight limit—for one cent a pound or fraction thereof, and while all appreciate the importance of carrying such matter at low rates, yet it is of the first importance that the mercantile interests of the country obtain similar concessions. The minimum express rate for domestic parcels, with a few trifling exceptions such as catalogues, which come in competition with present postal rates is 25 cents.

### Present Parcels Post Does Not Pay.

The Post Office Department has facilities equal, if not superior, to the express companies for the transportation of merchandise. John Wanamaker, at once a

great merchant and a genius in mail transportation, held that the present parcels post of 4 pounds does not pay, because the short hauls are almost invariably taken by the express companies, and the long and expensive hauls, upon which money is lost, are left for the department. A New England business house has a contract with an express company to carry 25,000 or more packages of third class matter, weighing 30 ounces each, at 13 cents per package, and after the express company selects such as it cares to handle, the department is obliged to carry the balance at 15 cents per package. But this is an unusually low figure and the hauls are unprofitable. The benefit of the full parcels post (and the reason why it is so extensively demanded) is that the post reaches thousands of localities where the express companies do not find it profitable to go

### Four Strong Objections.

There are but four strong objections to the parcels post, and they are the four great express companies, who would be just as well off with an 8 or 11 pound parcel post if the heavy freight of the executive departments and the immense packages of bogus serial books that are now thrown upon the mails were shut out and turned over to the express companies, where they belong.

### Our Foreign Trade is Hurt.

Our foreign trade is hurt by the disparity between one parcels post facilities and those of England, France and Germany. The parcels post privileges from the United States are confined to a limited number of foreign countries, and are not nearly so extensive as those enjoyed by England, France and Germany. It is believed, independently of other considerations, that by such a discrimination between this country and such other countries, the commercial interests of the United States are placed at a correspondingly great disadvantage. For illustration: A wholesale merchant in Detroit recently received an order from Australia for a caliper, weighing 4 ounces, which cost \$1.76 to transmit to its destination, by the existing methods of transporta-

tion in this country, while a competitor, in Windsor, Canada, across the river one mile, could send the same package for 12 cents by the parcels post rates of Great Britain. It is estimated that foreign business of this character, should we enjoy the same liberal provisions as now exist in Great Britain, could easily be increased three-fold at least.

### Extent of Our Foreign Service.

The trivial extent of our foreign parcels post service is shown in the table at the foot of this page. But by special agreement we can mail samples of merchandise not exceeding 12 ounces in weight to Gibraltar, Malta, British North Borneo, Ceylon, Cyprus, Hong Kong, Labuan, Straits Settlements, Cape Colony, Gambia, Gold Coast, Lagos, Mauritius, Natal, Seychelles and Sierra Leone.

### Duty Charges Not to be Evaded.

The prohibitory legislation of certain other countries, based on the assumption that the same is necessary to exclude dutiable articles, it is believed can be overcome by postal agreement or arrangement between this country and such other countries, whereby such articles shall be forwarded in a peculiar package, so as to show the nature of its contents, or by allowing such packages to go through in such a manner as packages are now received "in bond." All possibility of evading duty thus would be prevented.

### Comparing Foreign Service Rates.

In the following table a comparison is made of foreign parcels post rates on packages sent from this country and Great Britain:

	From United States.		From Great Britain.	
	3 Lbs. Amt.	11 Lbs. Amt.	3 Lbs. Amt.	11 Lbs. Amt.

operated from the back, and as few English cyclists ride without brakes fitted and always fit their lamps to the head, the screw could not be turned, the brake being in the way.

### WORKMAN'S LIEN LIMITED

**Bankruptcy Law Places Wage Claims Older Than Three Months Equal With Common Creditors.**

By a decision of the United States circuit court of appeals in Chicago a precedent has just been established which will be of general interest in regard to a number of cases now under adjudication under the federal bankruptcy law. It refers especially to those states whose statutes are at variance with the new federal law. The point in dispute arose in the involuntary bankruptcy proceedings of Rouse, Hazard & Co. of Peoria, Ill.

The new bankruptcy act provides that wages due workmen for work performed within three months before the commencement of bankruptcy proceedings shall be given priority of payment among the debts. The statutes of Illinois also make this provision of priority of claim, with the difference, however, that there is no statement as to a three months' time limit.

The district court of northern Illinois had allowed priority of payment to a certain number of workmen, but this order was taken to the court of appeals on a petition to review and revise, and the judges of the court of appeals found that while the Illinois statute does not state any limit as to the time of service, this does not give the laborer a further priority of claim under the bankruptcy act. They ordered the other court's decision on this point set aside.

Workmen who allow their wages to accumulate in the hands of their employers for more than three months will therefore hereafter in all likelihood lose their claim for preference for that part of the amount which dates farther back than the three last months before bankruptcy proceedings are instituted. Probably the books of the firm will be accepted as evidence of the age of workmen's claims, and they may therefore safeguard themselves somewhat by providing for having such part payments as they may receive applied to the oldest arrears on wage account that are entered on the books of their employers.

### Profits of English Makers.

Herewith are presented more reports showing the state of the English cycle manufacturing industry:

	Loss.	Profit.
Humber & Co. (Extension).....		\$52,625
(a) Osmond Cycle Co.....	\$ 40,970	.....
(b) Bard Cycle Co.....	.....	10,335
Adams Cycle Co.....	.....	2,325
(c) Joseph Appleby (chains).....	.....	29,165
(d) Caper Fittings Co.....	.....	65,000
(e) Bayliss, Thomas & Co.....	.....	27,550
(f) Elswick Cycle Co.....	.....	36,080
(g) Raleigh Cycle Co.....	.....	148,495
(a) The liabilities of this concern, which lost heavily in 1897, are \$1,108,470, with assets of about the same amount.		
(b) No dividend was paid.		
(c) This profit was on 18 months' trading.		
(d) This is the net loss for two years' trading.		
(e) A dividend of 10 per cent was declared.		
(f) A dividend was declared only on preferred stock.		
(g) This loss absorbs the whole of the accumulated reserve fund. This company has amalgamated with another concern. The banks are creditors of the Raleigh company to the extent of \$200,000.		

### How Mexicans Ride.

The Mexican wheelman has not yet accepted the American knickerbocker. He gathers his wide bottomed trousers around the ankle with a strap and lets it go at that. He not only retains the picturesque garments which he used to affect on horseback, but he has them made

in still more striking colors, adds a few more bright buttons, a little more gold and silver lace. He keeps his wide brimmed sugar loaf hat and decorates it still more lavishly. He does not use drop handle bars; therefore he does not hump over. He rides erect, as he used to on his horse, head up, shoulders thrown back and eyes alert for approving feminine glances. He smokes the inevitable cigarette—after he has become sufficiently expert to manage his machine with one hand. He is no scorcher. He does not boast about his mileage record nor indulge in century runs, but he comes out in the cool of the evening and circles around the public square where the band is playing. While Mexico is not exactly a wheelman's paradise, there are plenty of good roads to be found in the country. In the City of Mexico there are many miles of broad, smooth boulevards, and these make bicycling very popular in the capital.

### FIRST BICYCLE GAS LAMP

Was Designed by F. N. Fuller in 1895—Crude but Contained Essential Features.

It was in May, 1893, that Willson first accidentally produced calcium carbide and it was two years thereafter before anything was done with this discovery of a

commercial method of manufacturing this substance. One of the first uses thought of was in small portable lamps and it was as long ago as the end of 1895 that one of the officials of an acetylene company ordered an acetylene bicycle lamp made in Chicago.

This lamp, illustrated herewith, was probably the first acetylene bicycle lamp made in this country and was actually used for some time on a bicycle with satisfaction and success. It was designed in December, 1895, by F. H. Fuller and made for the Illinois Acetylene Co. At that time there was no generator on the market and this lamp was made for experimental purposes. It was built of brass, not nicked, brazed, was 7.5 inches in total height, the combustion and water chambers were cylindrical, 3 inches in diameter, with the smoke stack 1 inch and the carbide chamber 2.25 inches diameter. The water supply plug was perforated as are those of today; between the carbide and water lay the screw valves for supply gas and water. Their ends were conical and one was placed on each side of the lamp. Upon the top of the carbide chamber, which was screwed on, rested a plate carrying a grating through which the water dropped upon the carbide below and which prevented any lime clogging up the water tube. A large opening on one side let the gas above it, and

being cooled by the water chamber above, much of its moisture of saturation drained back upon the carbide. The burner was a Brag 2-hole made of brass and produced a flat flame consuming about one-fourth a cubic foot of gas per hour. About 2 ounces of carbide was required to charge it. We have not advanced much beyond this, even in some of our present designs, and although this early lamp was crude and made in a hurry principally to show that it could be accomplished, yet it contains many of the essential features of the lamps now on the market.

### Worcester Cycle Company Affairs.

F. S. Smith, receiver for the Worcester Cycle company of Middletown, Conn., has filed his inventory of the property of the company, showing assets of \$79,466.87. C. C. Goodrich, trustee of the company, has been granted permission by the United States circuit court to inspect the property any day next week, but the Central Trust company of New York city, complainant in the suit against the Worcester company, has filed notice of appeal from the recent order of the court recognizing Trustee Goodrich, appointed by the state court in the insolvency proceedings.

### Denies Rubber Combination Canard.

Regarding the alleged consolidation of several of the rubber manufacturing companies, as reported last week in the daily press, the following point-blank denial of any interest in the deal has been received from the makers of the Hartford tires, the denials of the two other most prominent firms mentioned having been published in this paper last week:

To the Editor.—Some few days ago it was announced in an Associated Press dispatch that The Hartford Rubber Works Co. had entered into a combination with various other manufacturers of rubber goods. So far as The Hartford Rubber Works Co. is concerned, there is absolutely no truth in the report. The Hartford Rubber Works Co. has always been successful in managing its own affairs, and will undoubtedly be able to continue to do so for some time to come.

THE HARTFORD RUBBER WORKS CO.

### To Continue Making Nonotucks.

To the Editor:—I have purchased the machinery, tools, all parts of wheels and stock on hand, with the good-will of the Hampshire Cycle Mfg. Co., of Northampton, Mass., and it is my intention to continue the business for the year 1899 and possibly permanently in connection with my other business. The Nonotuck wheel will continue to be made, and we hope to keep up its good reputation and make it even better than heretofore. Although the number of wheels manufactured may be on a somewhat smaller scale than previously produced, yet we shall do all the business we can with the limited capital at our command.

CHARLES E. HERRICK.  
Northampton, Mass., Dec. 30.

### Hold no Stock in Columbus Co.

To the Editor:—I noticed an article in your paper of December 29 stating that H. L. Chapman had purchased a controlling interest in the Columbus Bicycle Company. Mr. Chapman purchased the stock of J. A. Pfeifer at public sale to protect a loan made to him some time ago, but immediately sold and transferred same to G. C. Urlin and Lewis Fink. Neither H. L. Chapman nor the writer hold any stock in the Columbus Bicycle Company.

Columbus, O., Dec. 30. F. B. CHAPMAN.

A business good will may be sold by itself, and the sale is none the less valid because unaccompanied by any "plant" for the transaction of such business.

## SUBJECTS OF GENERAL INTEREST

REVIVAL  
IN  
BUSINESS

The country has been watching so long for a revival of business, and has so thoroughly concentrated its attention upon a condition hoped for in the future, that it is in some danger of not recognizing what has already happened. The truth is that what this country now needs is not so much a glorious boom as a happy continuance of present conditions.

These conditions are not universally satisfactory; there are localities and there are lines where the revival does not seem so substantial as might have been desired, and it is a general fact that the rate of profits is smaller than it was years ago. But this decline in the rate of profit is not so much due to any difficulty of selling goods as it is to the vast accumulation of capital and the energy of competition in production; it is very much like the reduction in the rate of interest. This is an unfavorable change for the capitalist, as such, but it is unquestionably a gain for the community as a whole.

What used to be known as business booms were largely speculative. If the country is not having one now, it has no reason to deplore the fact. It is certainly doing an enormous business of a healthy character. There is no evident reason why the present volume of trade should not continue and expand with the increase of population and the growth of capital. In a disposition to overtrade, and the inevitable reaction, there is some excuse for regarding panics as an essential feature of commercial growth, but with improved business methods and improved banking, and a currency above suspicion, the superstition that a panic is certain at periodical intervals can be exploded.

EXTINCTION  
OF WROUGHT  
IRON

With the resistless force of a glacier, but with a rapidity which is only slightly appreciated, steel is now supplanting all forms of wrought iron. Forcible arguments in favor of iron for certain purposes may be made, numerous engineers may continue to specify iron for special classes of work to which they consider it is better fitted than steel, and prejudice may incline the masses of iron workers to prefer the material which can be welded with least trouble, but the day is near at hand when wrought iron will be an exceedingly scarce commodity.

Complaints continue to be heard among mechanics of hard spots in steel which make it of an uncertain character in working, and of its comparatively rapid oxidation when exposed to the weather or to the action of water. For such reasons a reaction of more or less strength is from time to time noted in favor of wrought iron, but the greater cost of puddled iron as compared with steel silences the complaints, the steel maker sedulously endeavors to turn out a more reliable product, and steel continues to preserve its ascendancy.

The end of this century will in the estimation of even those who are deeply interested in wrought iron see the end of wrought iron as a distinctive designation, except, perhaps, in the case of Swedish iron or some other high priced iron specialty. Ordinary bar iron will have completely disappeared. It is becoming increasingly difficult to secure material from which to manufacture genuine bar iron. Scrap has long been

the chief dependence of the bar manufacturer.

But the greatest stocks of scrap iron are nearing exhaustion, iron rails are becoming a scarce commodity, and a new supply of cheap material for iron rolling mills is out of the question. It is almost an impossibility now for an expert scrap dealer to detect the difference between wrought iron and soft steel in the old material offered him.

And so much more steel is now being consumed than wrought iron that the production of steel scrap is increasing at a rate so rapid that wrought scrap will very shortly be steel principally.

THE  
EARNING POWER  
OF RAILROADS

The gross earnings of railroads from freight are substantially the same as the running expenses; there are in this country at present nearly 200,000 miles of railroad, and the operating expenses are about \$800,000,000 a year. The freight receipts are substantially the same—\$800,000,000 a year. When commercial operations are extensive freight receipts increase, and along with them there are increases in the expenses of operation, which usually keep pace. When business interests languish and freight receipts fall off there is usually a corresponding reduction in operating expenses, so that it may be said that the running expenses generally are paid from freight receipts, and the other items of revenue, passenger receipts chiefly and mail receipts to a minor extent, pay the interest on bonds, the dividends and the profits—when there are any.

The question is sometimes asked why it is that such vigorous efforts are made by railroad managers to develop the passenger business in preference to freight traffic, but the explanation is to be found in the fact that while the revenues from the former are usually regulated by the volume of business, the passenger receipts are regulated generally by the character of the service offered, independent of the condition of business. Necessarily a railroad, to enjoy a large measure of passenger business, must be in very good physical condition, and for this reason some of the poorer roads are unable to compete successfully for passenger trade—the trade which pays the profit from operation of American railroads, \$1,000,000 a day on the average.

RESULT OF  
WAR  
IN EUROPE

Taking the statistics of former great wars as the basis of calculation, we find that the daily expenditure needed for a conflict in which the five continental great powers were engaged would amount to about \$21,000,000. Over and above this sum it would be necessary to expend on the families of the soldiers about \$990,000. In other words, the annual cost of a European war, exclusive of indirect losses, would, according to the calculations of experts, reach the fantastic total of \$8,735,600,000. But if, as experts believe, this Titanic combat would last for two years, the ruin of the belligerents would be complete and irreparable.

Meanwhile, while Europe was busy bleeding herself to death, America would secure forever the markets of the world. Even now, handicapped by no more than the burden of an armed peace, Europe offers no parallel to the industrial and commercial advance of the United States.

The United States are not merely by far the richest of peoples, but the rate at which their national wealth increases is considerably greater than that of any other nation. The main cause is the absence of militarism. And the more deeply indebted the European becomes, the more rapidly the Yankee is paying off his financial obligations and the easier it is for him to compete with his European rivals. The great war, if it came, would leave us master of universal trade.

This aspect of the question is said to have appealed with the greatest force to Kaiser Wilhelm, whom the Czar consulted about his plan for universal disarmament.

ELECTRIC  
MOTOR  
USES

The value of the electric motor as a factor in the reduction of working costs is well known. But its more complete adoption in the near future will lead to the revival once more of a number of small and independent industries such as existed, but under different conditions, in former years. The possibilities are already being grasped by the artisan here and abroad. By the aid of the small electric motor he begins to find that he can at least hold his own in competing with immense manufacturing concerns and combinations; he has a practically unlimited available power at his own door which offers an inducement to become his own master. In a very small and limited degree the gas engine has already accomplished something in this direction, but its many imperfections, its cost, and the fact that it has never been available on the hire system, have kept it more or less in the background.

STEEL WOOL  
FOR  
POLISHING

The demand for a substitute for sandpaper has led to the introduction of a material known as "steel wool." It is made from tempered steel shavings in different degrees of fineness, which cut as smoothly as the finest emery and much quicker. Being held in bulk, it readily adjusts itself to the form of the surface to be operated upon, reaching into the finest corners and cutting away all that is desired, doing the work without clogging. As it does not clog up and wears long, it is cheap to use.

The wooden bicycle used by Blondin in his famous ride across the Niagara falls on a rope is still in existence, and was sold in Paris not long ago for half a crown.

The crew of the Japanese cruiser Kagsagi, recently launched in this country, carried home a large number of American bicycles when the vessel sailed. There was almost one apiece for the entire crew.

The chief of police of Atlanta, Ga., has recommended that as repairs upon the fourteen bicycles now in use by the department cost the city about \$30 a month, a small repair outfit be purchased by the police board so as to enable the officers to do most of their own repair work.

As a result of the recent experiments with automobile fire engines the Paris municipal council is considering the advisability of introducing automobile machines for watering and sweeping the streets.

## RECENT PATENTS

## Automatically Changeable Driving Mechanism—Single Point Contact Gear—Three-Wheeled Cycle

**Variable Size Driving Pulley.**—This device, which comprises a set of driving and driven pulleys and which may be adapted to use on bicycles, is so constructed that when the load put on the driving pulley exceeds a certain limit that pulley will be automatically decreased in size while the driven pulley will be at the same time correspondingly increased, thus lowering the gear of the driving set and, if it is on a bicycle, lowering the gear of the machine and allowing the rider to cover the hard riding on the low gear, which will return to the normal size as soon as the load again drops to the fixed limit. The driving pulley transmits its motion to the driven one by means of a chain composed of V-shaped links which are received by V grooves around the peripheries of the pulleys. These grooves are not continuously formed in the bodies of the pulleys, but in each case a set of segmental pieces approximating the circumference of the pulley are attached to tangentially arranged spokes secured to the pulley hub. The segmental pieces are guided and supported laterally by side plates. These side pieces are

attached to hub parts which surround the crank axle and are connected therewith through the medium of a coil spring, the action of which is limited by a slot and pin device. The hub piece which supports the inner ends of the tangential spokes is rigidly secured to the axle. When the load on the pulley is normal, that is, less than the tension of the spring, all of the parts will rotate together, but as soon as the load becomes heavier than the tension of the spring the latter gives to the extent allowed by the slot and pin and the axle moves that much forward in its relation to the side plates of the pulley. The axle in carrying with it the hub supporting the spokes causes the tangency of the latter to be increased and the circumference of the segmental pulley groove to be diminished. The pulley on the rear wheel hub is similar in construction with the exception that the operation of the spokes is opposite, so that the circumference of the rear pulley will be increased when that of the driving pulley is decreased, thus preventing chain slack. The inventor is J. C. Pratt, Hartford, Conn.

**Cement Injector.**—Theoretically one of the reasons why the injection of heavy cement through punctures in single tube tires does not always stop the leakage is that the cement being pushed out of the injector nozzle through a single delivery

hole gathers in a bunch, lying mostly on one side of the puncture, unless the person who makes the repair is experienced enough or has foresight enough to twist the nozzle around in withdrawing it so that the cement will be worked into a button lying directly over and completely closing the hole. The injector in this invention is applied to an ordinary cement holder from which the cement is forced into the nozzle by a screw

plug, and instead of being a round, smooth tube, is tapered and threaded on the outside. The cement passage ends in a transverse hole a short distance back of the point and has an opening on each side. When the nozzle is pushed through the puncture it gains entrance by being turned, thus screwing down into the hole without tearing the fabric or enlarging the puncture, the tire body material being merely pushed aside. The cement on flowing out of the nozzle falls to the interior of the tire in bunches of practically equal volume, one on either side of the puncture. To remove the injector the operator is compelled to screw it out backward and in so doing causes the cement to be twisted and formed into a single mass directly over the puncture. The tip of the nozzle in passing out of the puncture will also draw a small amount of cement with it, thus tending to further close the hole. The inventor is William Herrick, Chicago, assignor to Morgan & Wright, same place.

**New Form of Bevel Gear.**—To reduce as much as possible the friction between the engaging teeth in bevel gears and

other similar chainless driving gears for bicycles this bevel driving gear is cut with the acting faces of its teeth convexly curved and engaging teeth on the

pinion which have the shape of frustrated cones. The cones are cut out of the pinion stock itself and may be accurately located. The supposition of the inventors is that as the engaging teeth can touch each other at but one point instead of along a line the friction is reduced to a minimum. It is one of the first laws of friction that its amount is not dependent upon the extent of surface between the contacting surfaces but upon the weight or pressure exerted upon the moving parts. It is thus evident that if a convex tooth slides over a conical engaging tooth and in sliding touches only at one point it will still produce the same amount of friction as though the faces of the teeth were straight and touched for their entire width, other conditions being equal. The gear, however, doubtless has the advantage of being able to adapt itself to small changes in the alignment and relative positions of the gear and pinion. The inventors are J. A. N. and C. B. H. Rasmussen, Copenhagen, Denmark.

**Anti-Vibratory Three-Wheeler.**—This invention has the object of furnishing a cycle on which the rider does not feel with common severity the jolts and jars occasioned by rough roads, and the manner of attaining the desired end is novel in that no spring or cushion devices are employed. It embraces the use of three wheels, but the parts of the frame occupied by the rider are strictly rigid in their relation to each other, a point which is not carried out in the three-wheelers now made. As shown in the patent office sheets, the invention is worked out in a tandem machine, although the same scheme may be applied to singles. The middle wheel, which acts as the driver,

is not secured rigidly in the frame, but is hung in a fork hinged at the rear crank hanger and projects forwardly in an approximately horizontal direction between the double horizontal tubes connecting the front and rear hangers. The front chain drives to the rear hanger axle and the rear chain runs directly forward over the sprocket on the driving wheel. The fork carrying the driving wheel extends backwardly and upwardly from its hinge at the rear hanger, as a single tube connecting with a short steering head carrying the forks of the third or trailing wheel. With this arrangement of the two rear wheels, when the driving wheel strikes an obstacle and rises to surmount it the rear crank hanger, which is the rear corner of the frame carrying the riders, rises only about half of the distance that it would were the driving wheel rigidly placed in the frame, and when the trailing wheel reaches the same obstacle the frame is again raised a similar distance. In other words, were a two-inch obstacle met, the rider, through the frame, would experience instead of one severe two-inch jolt two less effective one-inch jars. The value of the machine depends upon the question as to which would be easier on the rider in the long run: A certain number of severe jars or twice the number of jars half as great. Unnecessary parts are added to the machine by the rigging up of steering connections whereby the trailing wheel is turned by the handlebars in unison with the front wheel of the machine. The third wheel being hung as a trailer is

**Eclipse Bicycle Company**  
Elmira, N. Y.

bound to follow the track of the bicycle without the aid of steering connections. Another evidence of needless caution on the part of the inventor is that he places the central line of the steering head of the trailing wheel in a position inclining slightly backward from vertical in order that when the trailing wheel is raised to pass an obstacle the steering head will not incline forward from vertical. As long as the central line of the trailing wheels's steering head, which is indicated by a dotted line in the illustration, touches the ground ahead of the point of contact of the tire, the wheel will trail properly no matter what may be the inclination of the steering head ahead of the vertical. The inventor is Robert Miehle, Chicago.

**Spur Wheel Driving Gear.**—A short, compact chainless bicycle, of the old "Broncho" type, with the saddle directly over the rear wheel, but without the constant danger of bucking backward, is embodied in this invention. The cranks are independent inasmuch as each drives a

separate chain of three spur gears which are supported in boxes built in the frame. The cranks maintain their proper relations to each other because the gears drive the same axle. The gears bring the cranks enough forward of the rear wheel axle to allow the rider to assume an ordinary riding position and at the same time to have his saddle far enough in front of the center of the rear wheel to prevent the front wheel from being lifted from the ground. The inventor is George Cad-dick, of Allegheny, Pa.

**Bevel Driving Gear.**—This is a form of bevel gear driving mechanism, in which the principal point covered is the arrangement of the right rear fork of the bicycle frame. This fork tube is located inside of the driving shaft connecting the

front and rear gear sets, instead of outside, as commonly, the driving shaft being supported between exterior ball bearing seated in the gear boxes. The inventor is John Parker of Philadelphia, Pa.

**Tire Plugger.**—This tool is novel since it uses a plug comprising a short triangular piece of rubber instead of the usual headed plug. The plugger in the main consists of a pair of jaws hinged to each other and one of which is secured to the bottom of a hollow handle piece. A ring

slipped down over the jaw arms and sliding on the tapered depression in one of the arms is used to open or shut the jaws as desired, it being operated by another ring near the top of the jaw pieces and joined to the lower by a narrow connecting piece. A cylinder made to telescope inside of the hollow handle and with an returned flange at its outer end allows a narrow circular opening between its in-

ner edge and the slide ring. The triangular rubber is slipped through the conical opening between the jaws, after which its ends are bent downward and the telescopic piece pushed down over them, doubling the rubber piece upon itself along the sides of the jaws. The plug is then ready for insertion into the puncture, the tool being pushed down into the hole nearly to the telescoping slide retaining the ends of the rubber. The tool may then be withdrawn, leaving the doubled rubber in the puncture. Just how the jaws are loosened sufficiently to allow their withdrawal from the tire without pulling the rubber out also the patentee does not make clear. The inventor is C. P. Gifford, Erie, Pa.

George Harden, Toledo, has been granted a patent on his chainless bicycle, which is already familiar to the trade. The invention embraces the use of ordinary bevel gears in the same manner as those in the common bevel gear chainless, the main difference being that Mr. Harden employs two sets of gears, one on each side of the machine, the object being to make it possible to employ small gears without their structure and alignment being endangered by torsional strains in the rear of the bicycle frame. Further points brought out in the invention include the casing of the gears in such a manner that ready access may be had to both the forward and rear gears or pinions on the longitudinal driving shafts for adjustment and other similar purposes; the provision of removable cases for the engaging gears at the crank hanger, and the utilization of parts of the bicycle frame for holding these cases against lateral movement or displacement.

**COUNTER-SHAFT CLUTCH**

Use of Balls Obtains Easy, Positive Operation and Quick Release—Simple to Make.

The arrangement of light machine tools such as cup and cone grinding machines, etc., on benches and in similar positions, makes desirable the use of some kind of counter-shaft clutch to dispense with the shifting belt and the tight and loose pulleys. If the counter-shaft driven pulley be arranged with some suitable clutch whereby it runs loose on the shaft when the machine to be operated is not in use and may be held tight on the shaft when it is desired to run the machine, much of the trouble and annoyance commonly caused by the shifting belt may be dispensed with.

In the accompanying illustration is shown a practical friction clutch especial-

ly adapted for use with counter-shaft pulleys. To the counter-shaft, A, the pulley B, is fitted to run loosely. At the right of the pulley hub a locking ring with securing set screw stops end play of the pulley toward the right, while a long sleeve, D, also attached by means of a set screw, keeps the pulley from playing toward the left. Fitted to the sleeve, D, with a feather and spline, K, so that it revolves with the sleeve but yet may slide longitudinally on it, is a disk, C, the right turned flange of which is tapered on its edge to match the left taper end of the pulley. The two taper surfaces are normally out of contact by a very small distance. Between C and the flanged end of D is a spiral spring, J. At the left of the hub of C are two hardened steel sleeves the outer of which, H, is set a short distance away from the inner and has its adjacent end tapering outwardly. Fitting around H is a sleeve, E, the counter-bored end of which has a taper bottom. Between E and the hardened sleeves and lying over the opening between the two latter is a row of steel balls, F. End movement of the sleeves, H and E, toward the left, is limited by the lock nuts, G, screwed onto the threaded end of the sleeve, D. An annular groove in E permits of the attachment of any desirable lever or other means for its longitudinal movement on H. When E is pushed to the right the inclined bottom of its counter bore presses the row of balls down into the taper opening between the hardened sleeves, thus causing them to sep-

arate. As H cannot move to the left its mate sleeve must move to the right pushing before it, against the pressure of the spring, the flanged disk, C. The taper surface of C then binds and wedges against that of the pulley, B, which accordingly no longer runs free from the counter-shaft but rotates the latter with itself. A slight annular groove in the counter-shaft is placed to allow the balls to be pressed clear down below the outer circumference of the hardened sleeves, though it is evident that if these sleeves have a wall thickness greater than the diameter of the balls this groove will not be needed. Upon the return of the sleeve, E, to the left the spring will release the friction clutch and force the balls again to the top of their expansible seat.

The clutch has but few parts, is quick and positive in its action and can be made on any ordinary lathe, there being no milling machine work except the fitting of the spline and feather, K, between the disk, C, and the sleeve, D.

**An Opening in Philadelphia.**

Manufacturers and jobbers desiring representation in Philadelphia and contiguous territory are requested to address "B," P. O. Box 292, Philadelphia.

Francis & Nygren's bicycle factory in Chicago was burned last Wednesday in a fire that destroyed the building erected last spring by E. T. Harris at a cost of \$10,000.

## SPEED AND GEAR CHANGES

### Ways and Means for Imparting Flexibility of Power to Gas Engine Vehicles

The electric driven carriages have usually no change of gear. The motor drives the compensating gear disk with a fixed speed reduction of about 12 to 1 in case a single motor only is used; if two motors are used, one for each driving wheel, thus avoiding the compensating gear altogether, the case is still the same so far as the gear is concerned, each motor geared with a single fixed reduction of 10 or 12 to 1, to the wheel it drives.

With the explosion engine motor driven wagons an altogether different practice prevails, from two to four changes of gear being introduced between the motor crank shaft and the compensating gear disk, or the driving wheels of the compensating gear is omitted. The idea is, with the electric motor, to vary the power of the motor by means of the controller, so that when a slow rate of travel is desired it can be obtained by reducing the driving power, and current expenditure, and when a high speed on the road is required it can be obtained by increasing the power of the motor, thus increasing its revolutions per minute, at the expense, of course, of more current consumed.

#### Customary Change-Gearing.

The theory most commonly adopted in respect to the explosion engine, is that the revolutions of the motor shaft should be kept nearly the same at all times, and that changes of wagon travel rate should be had by throwing different trains of gearing into action, between the motor shaft and the driving wheels. The result of such an arrangement of mechanism is the very strong driving of the wagon at low speeds, which is desirable in covering muddy or snowy roads, and in hill climbing. To produce the desirable result with the explosion engine motor three or four trains of gear, either belted or toothed, are commonly employed; one train is low speed, one medium, and one high speed forward, and one reversing low speed train is introduced to obtain a backing movement. This makes four separate trains of gears from the motor shaft to the drivers, and involves the use of four shifting devices of some sort by which any one of the trains of gear may be placed in action while the other three are rendered inoperative. These multiplied trains of gearing are highly objectionable in themselves, as they increase weight, take up room, cost money at first, and demand time and labor and more money to keep them clean and in good repair. The clutches or belt shifters, or belt tighteners, "jockey" pulleys, pinching rolls or what not, used to effect the gear changes are even more objectionable than the gear trains themselves; if the clutches are made with plain interlocking jaws they cannot safely be thrown into action except at slow speeds; if friction clutches are used they must be nicely adjusted and are always liable to give trouble; if the gears are made to slide axially into and out of mesh with their coacting members—a favorite French plan—then the engagement is effected at the risk of breaking the gear teeth, and in short there is absolutely no really good and acceptable way to make a change of gear speed known in mechanical construction today. There are a thousand devices which can be used for this purpose, but not one which a judicious engineer de-

sires to incorporate as a part of his work.

#### One Gear Change Indispensable.

What real need is there for a gear change in a gas engine driven wagon?

In the first place, if the gas engine runs only one way then there must be at least one gear change in order to obtain a backing movement, which is an absolute necessity for a road wagon. A reversing gas engine is not unknown, but so far all of the motorcycle designers, or at least almost all of them, have trouble enough to make gas engines reliable when running in one direction only, and prefer to reverse by gearing rather than by trying to make the gas engine run either way at will, as the steam engine does.

This makes one change of gear a necessity for the explosion engine driven wagon, same as for the steam engine driven vehicle, or the electric carriage. If this change can be made by reversing the gas engine itself more easily than by the introduction of a change gear, the motorcycle designers will discover the fact some day, and act according to their light. At present the practice is to back the gas engine wagon by the use of a clutch and a change of gear, and to back the steam wagon by changing the direction of motion of the steam valves with relation to the piston travel direction.

This one change of gear needful for the explosion engine is not so very bad, since it may be compact and so may be wholly enclosed without much trouble, and it may be taken as fully proved that no successful motorcycle can ever have any running parts left accessible to road dust.

Granted, then, that one change of gear must be used with the gasoline engine motorcycle motor, must there be more than that one gear change introduced?

#### When Several Cylinders are Employed?

This is a question of the greatest practical importance. It is also a question which requires a careful common sense balancing of favorable and unfavorable elements and actions before an intelligent answer can be given.

The first essential element of this problem is the number of motor cylinders which are to be used.

If there is to be but one cylinder, after the Benz manner, Otto cycle, then there is no more to be said. The fly wheel is indispensable, and the velocity of the fly wheel rim must be kept constant, or nearly so, and there should be no less than three changes of gear on the forward motion, and there cannot be less than one backing gear, making four gear changes in all. The same is true of that form of two-cylinder explosion engine, cranks at 180 deg., in which the working strokes of the cylinders are made simultaneously—the fly wheel velocity must be maintained and variable carriage travel can be had only through gear changes.

But when the number of cylinders is so increased as to give a continual torque say, as written in a previous article, to 5 cylinders, then an entirely new set of conditions and possibilities present themselves, because the necessity for a constant velocity of the fly wheel rim has disappeared, and in fact the fly wheel itself may be wholly eliminated, or at least so greatly reduced in weight as to cut no important figure in the vehicle propulsion. With 5 cylinders—the wagon

to carry two passengers, with a total weight of from 750 to 800 pounds—the cylinders would require to be about 2½ to 2¾-inch bore, and the admission valve should be so moved as to make the small charge somewhere about half the piston displacement in volume, and the cylinder clearance must of course be reduced so that this minimum in partial charge will be compressed sufficiently to explode. With the full cylinder charge the compression and consequently the initial pressure would be very high, with the resulting possibility of making the engine two or three times as powerful with the full charge as with the smallest charge which could be exploded.

#### One Shortcoming of Cylinder Plurality.

Such an arrangement would very closely approach the power conditions of the Stanley steam wagon, and a single gear reduction from the engine shaft to the compensating gear disk would answer perfectly for the good road and hill climbing functions of the wagon. For a very muddy or snowy road, where slow speed and high power are needed, this 5-cylinder single geared drive would probably lack something of the effectiveness of a low speed gear, with the velocity of the single cylinder driven fly wheel maintained at a constant speed. This 5-cylinder drive would be perfectly controlled by varying the volume of the explosive charge, and the greatest power exerted by the motor could be made two or three times as much as its least power. The whole effect of this drive would be a close approximation to the steam driven wagon in its best form. Perhaps 5 cylinders, 2½-inch bore by 5-inch stroke, reduction 3 to 1 from the engine shaft to 28-inch driving wheels, would be found satisfactory, as such a gas engine would give at its best at least 175 or 180 pounds initial pressure. I should expect a wagon weighing 800 pounds total, so driven, to do at least twelve miles per hour on grades of 1 in 10, and from 20 to 25 miles per hour on the level, without water and without noise.

HUGH DOLNAR.

### COMPRESSED AIR OMNIBUSES

System Competing Closely With Electricity to be Installed on Fifth Avenue in New York.

The very worst line of omnibuses in the world is about to disappear from Fifth avenue, New York city. It has changed hands, and the new owners assert that the miserable wagons and wretched horses of that line will be immediately replaced with mechanically driven vehicles, using either compressed air or electricity as the motive power.

No more favorable opportunity for a thorough exposition of the practical value of compressed air for driving passenger vehicles could be desired than that afforded by the Fifth avenue line service. The line is not very long, and the grades are not very heavy, while with good carriages the traffic would be large and hence remunerative. There is no more trouble in supplying a line of omnibuses with compressed air than with electricity; in fact, the figures will probably show something in favor of compressed air for the motive power steam and compressing plant, while the filling of the "bottles" of a compressed air driven wagon with a fresh charge of compressed air requires only two or three minutes, as against the three hours required for recharging a storage battery; and the weight of motive machinery carried by each vehicle may be far below the battery and motor weight demanded by vehicles of equal capacity driven by electricity.

All of this looks very favorable for compressed air in this special instance, and it would not be at all surprising to see a trial of compressed air motors made

on this route. The compressed air makes as clean a drive as electricity, and can be equally still. The compressed air motors require a little fire, but not much, and it would take no great exertion of mechanical ingenuity to make a compressed air wagon to have a cold floor in summer weather, which would be really a point in favor of the system.

The total weight of the compressed air vehicles could be kept some hundreds of pounds below that of electric 'busses of equal capacity, and it seems that it would be quite the correct thing to try the compressed air system out, now that such a really suitable place for its use is offered.

HUGH DOLNAR.

### EASTERN AUTOMOBILE ACTIVITY

**French Order for Fifty Vehicles Placed in Holyoke—Overman Order Not Confirmed.**

Springfield, Mass., Jan. 2.—A dispatch from Chicago last Thursday announced that a large contract for motor vehicles had been received by the Overman Wheel company, of Chicopee Falls. With regard to the subject, President Overman could not be seen, but one intimate with the affairs of the company disclaimed to a Cycle Age representative any knowledge of the reported contract. From the same source, however, it was learned that the Overman carriage is progressing and will be in the race for public favor with other makes that are being perfected.

During the past week a bona fide order for fifty motor carriages, to be completed by October 1, was placed with the Holyoke Motor Works, of Holyoke. The carriages to be made by this company will cost \$1,400 each. The company has not facilities for filling so large an order in its own works and will have part of the work done outside. The assembling, however, will be done at the company's plant in Holyoke. The carriages will be sent to Paris, the order being placed in the United States, it is said, on account of the inability of French makers to supply the demand in that country.

Interesting rumors about other Connecticut valley motor carriage promoters are current and some important happenings are likely to be made public in the near future. One or two large bicycle makers hereabouts, who have heretofore been skeptical concerning motor carriages, are known to be experimenting with automobile models.

### Metallurgist Branches Out for Himself.

Henry Souther, an expert metallurgist, chemist and bicycle constructor, who has rendered valuable services to the Pope Manufacturing company for more than five years as superintendent of the department of tests and of the manufacture of steel of all grades for special purposes, resigned his position with that company on December 31 and has established an office and laboratory as consulting engineer and expert in metals at 438 Asylum street, Hartford, Conn.

### Canadian Automobiles for France.

A Toronto company called the Canadian Motor Syndicate is making arrangements for the sale of its line of electric carriages and victorias in the French market. The company states that its 5-horse power carriage, fitted with hydro-carbon motor, weighs 750 pounds unloaded and its victoria storage battery of 5-horse power has a total weight of 800.

The Triumph Cycle Company, the Raglan Cycle Company, J. K. Starley & Co., and Allard & Co., all of Coventry, England, are beginning the manufacture of motors for motorcycles.

## THREE CYLINDER GAS MOTORS

### GEARING OFTEN UNNECESSARY

#### Slow Driving Made Practicable and Available Power Increased by Multiple Cylinders—The Heat Radiation.

To the Editor.—The writer took pleasure in reading an article in a recent issue on the advantages of multiple cylinders for gasoline motors. The Duryeas have spent much time and money on this part of the gasoline motor problem. They have believed that the American public wanted the best article possible to produce, regardless of its cost, and have not confined themselves to the single cylinder motor because of the less cost. Our earlier experiments were made with single cylinder gasoline engines, but the difficulty of overcoming the vibration and the lack of elasticity of movement led us to try double cylinder motors. These were a marked improvement and have given excellent satisfaction, but were not considered absolutely final, and a triple cylinder motor was next tried. This motor runs with less vibration than the two cylinder, and gives an almost constant torque to the driving shaft. It receives an impulse each two-thirds of a revolution and is therefore almost constant in action. When fired with battery spark, pulling one piston past the compression point will start the motor so that less than a full turn suffices to get the motor going. This is so simple that it may be performed by the operator sitting in the seat of the vehicle, in most cases.

#### Between Two Extremes.

A single set of two to one spur gears operates the cam shaft for all three cylinders, and the added complexity of parts is not proportionate to the added number of cylinders. There are of course the additional inlet and exhaust valves, which need attention, and the additional sparking mechanism, but thus far we consider the multiple cylinder an improvement and a decided one.

Whether four or five cylinders would be a further improvement we are not in position to say practically. There is no doubt but that increasing the number of cylinders adds to the complexity, which is as objectionable, on one hand, as the single cylinder, with its few impulses, great vibration and little elasticity are on the other. Whether the three cylinder is the "golden mean" between these two sets of disadvantages, or whether more cylinders would be better probably remains to be proved, but we are certainly much pleased with the results obtained from three cylinders, and regard same as being the best yet produced.

We find that we are able to run the vehicle at very slow speeds with the triple cylinder motor, because there is no danger of stopping between impulses. It is common practice to drive our vehicles on the street with the motor running at less than 100 revolutions per minute. This is about one-third the speed possible with a single cylinder motor. On the other hand, each cylinder is capable of just as high speed as the single cylinder, and so the three cylinder motor will run as rapidly as any single cylinder, and give three times the power.

#### Few Reversing Parts.

These facts permit us to drive our vehicle on all good roads without the use of gearing, and we therefore attain the much boasted simplicity of the steam engine without its complex and troublesome boiler. For heavy hill climbing and similar service we use a low gearing, and, by an additional friction clutch, this gearing serves to give us a reversing motion. We consider, therefore, that we can re-

verse our vehicle as quickly and with as few reversing parts as a steam engine; while the advantage of low gearing for hill climbing or mud makes our vehicle more capable than a steam driven machine.

The writer of the article referred to contended that small cylinders could be depended upon to radiate heat sufficiently fast to keep them cool, but our experience does not carry out that statement. A single cylinder throws off heat in all directions, but, if placed between two or more other cylinders, it loses a goodly share of its opportunity to radiate heat, and is, therefore, liable to give trouble.

It might be possible to set these cylinders at equal distances around the crank shaft, but this disposition is not convenient for motor vehicle service. There is, doubtless, considerable opportunity to experiment along this line, but success does not seem positively assured.

The writer will be pleased to hear from others on these points.

Peoria, Ill.

CHAS. E. DURYEA.

### Automobiles in Italy.

The automobile industry in Italy is slowly but surely getting a hold. A year and a half ago a few Italian sportsmen started an automobile club in Milan, which organized a few competitions on the road between the different horseless carriages, but owing to the way in which things were arranged no interest was taken in the matter by the public, and the club is hardly likely to give the necessary push to the new industry. However, a new club has just been started in Turin and many influential and rich people have joined. In Turin a new company is being formed with a capital of \$50,000 for the construction and sale of automobiles with the Daimler motor.

### Motor Vehicles in Paris.

The Paris public will shortly be able to enjoy motor drives with the new cars which are to be put on the streets by the Compagnie des Petites Voitures. Three different kinds of vehicles are to be introduced, coupes with three and four seats, victorias for four and five, and landaus for four persons. The vehicles, which are to be driven and lighted by electricity, will have a speed of ten miles an hour. The accumulators take only two minutes to charge and last for forty miles.

### Open an Ice Skating Rink.

The Barnes & Riblet Cycle company, of Aberdeen, S. D., has opened an ice skating rink for the winter. The admission has been placed at 10 cents and skates can be rented for the same amount. A warm waiting room has been provided and the rink will be kept open every afternoon and evening when the weather is favorable. Announcements of open days and special features are posted in the company's store window. As a winter venture when trade and repair work on bicycles is slack this enterprise promises good returns.

### Spaces at Montreal Show.

No spaces will be awarded before February 1 for the Canadian cycle show to be held in Montreal so that all applicants will have the same opportunity. Already there are a number of applications from manufacturers in Canada and the United States who wish to exhibit.

An international motor vehicle show will be held in Verona, Italy, in the early part of next March, in connection with the horse show. All vehicles exhibited will have to take part in the Verona to Milan and return (320 kilometers) road race.

# INFORMATION FOR BUYERS

## BRIDGEPORT TUBE BENDING MACHINE.

The Bridgeport Tubing Co. of Bridgeport, Conn., makes the tube bending machine here shown, which, while it is especially intended for bending handle bars and curved tubes for ladies' frames, may also be used for curving any kind of tubing for any purpose, the combinations of curves and intervening straight portions in the tube to be bent being unlimited. The machine is designed to take any size of tubing up to 1 1/4 inches in diameter and bends unfilled tubing.

The tube is bent accurately to the form desired and maintains, with but the slightest variation, its circular cross section after the operation. The surface of the tube on the inside of the bend is left smooth and free from ridges. The bending is done on a grooved roll mounted on a spindle projecting from the top of the column. The roll is engaged by a sliding table, correspondingly grooved, and which, in connection with the roll, grasps the full circumference of the tube. In the groove lies a mandrel attached to an adjustable rod which extends to and is attached to the rear of the machine. On this rod is an adjustable gauge on which the end of the tube rests, that all bends may be of uniform length. The grooved roll is doweled to a yoke and both revolve on the spindle. Between the yokes is a sliding bar, on the end of which is a gripping device and which is grooved to match the groove of the roll and table. When two bends are to be made in a handle bar, leaving a straight portion between them, a horizontal gauge is fastened to the edge of the yokes in order that both bends may be in the same plane, but when only one center bend is to be made, the gauge is not needed. Two men, one to feed and the other to work the lever handle and sliding table, are required to successfully perform the bending operation, which is as follows: The tube is placed on the mandrel to the stop gauge and the sliding table forced up to the rear of the yokes. The first forward motion of the hand lever acts on a compound lever, which forces the sliding table against the roll, thereby firmly clamping the tube. The continued movement of the lever rotates the roll, the clamps drawing the tubes from the mandrel, while the sliding table, starting with the yokes, supports the tube till the

end of the stroke, which is regulated by a stop dog. The sliding table is then pushed back, the yokes returned to place and the tube removed. From the above it will be seen that bends may be formed in almost endless variety.

## HINE-WATT SELF REGULATING LAMP.

Hand made samples of the new Self Regulating Octagon gas lamp made by the Hine-Watt Mfg. Co., 16 North Canal street, Chicago, have been completed, and have proven so satisfactory that the company is making

vigorous efforts to place the lamp on the market in a commercial shape within the next few weeks. The lamp, an exterior view of which is shown herewith, is very compact in construction and made entirely of metal. The water chamber, located in the longitudinal octagonal body back of the combustion chamber, is directly over the vertical axis of the lamp. The carbide, any form of which may be used, is held in a removable receptacle screwing on to the lower end of the lamp body. The generated gas does not pass directly to the burner, but first goes through a small chamber at the rear of the water reservoir and there works its way through some dry carbide, which absorbs all moisture in the gas and leaves it dry when discharged at the burner. One of the strongest claims for the lamp is based on the water feeding mechanism, by means of which the flow of water is regulated automatically by the gas pressure. The water is fed to the carbide in proportion to the size of the flame being burned, and is not dependent upon any regulation of water valves—in fact, there are no water valves. A small gas valve below the burner allows the operator of the lamp to control the size of the flame, which simultaneously regulates the water feed. Though seldom needed, a safety valve is fitted to make the lamp safe, no matter in what position it may be carried. Bicycle accidents or other causes which tend to upset the lamp have no effect upon its operation. As soon as the flame is turned out the water ceases to flow, and no more gas is generated. This

makes it possible to turn out the light, set the lamp away over night, and relight it the next evening without any surplus gas having been generated or having escaped to cause a disagreeable odor. The weight of the sample lamps is 18 ounces each, but the company is confident that the weight of the machine made commercial lamps can be reduced to 12 ounces.

## PEERLESS MACHINES AND PRICES.

The Peerless Mfg. Co. of Cleveland announces that it is listing its Peerless road machines at \$50 and placing a price of \$35 on the Triumph models. The Peerless machines are made with long, low, rakish frames, having flush joints throughout and tapered forks and stays, with D-shaped rear ends. The Peerless tubular fork crown and a special two-piece hanger group are also features. The finish is in plain lustrous enamel. The lady's machine, which has a graceful double curved front frame, allowing ample mounting and skirt room, is built in other particulars the same as the man's model. The metal chain guard is lined to prevent rattling. The Triumph men's and women's machines are built on popular lines, with arch crowns, flush joints and one-piece hanger group. The finish is black, carmine or Peerless green, either plain or ornamented. All four of these patterns, as well as the Blue Bird track racer, will be furnished upon special order with frame lines changed to accommodate 30-inch wheels. The double diamond tandem, which is furnished in both single and double steering types, lists at \$75. For the combination tandem \$85 is asked.

## RUSCH BICYCLE SADDLES.

Five patterns of hard and padded Rusch saddles are catalogued by N. Schroder, 91

Thompson street, New York. Model 8, which is here illustrated, is a man's padded saddle fitted with flat springs. It has no metal base and will conform to the shape of the rider on account of the peculiar construction of the cantle. The top is 9 1/2 inches long by 7 3/4 wide. The lady's saddle to match this pattern has the same cantle construction and is made quite wide to allow comfortable seating. The pommel is short enough to offer no hindrance in mounting, though it is still not too short to help the rider to sit steadily on the seat. An unpadded racing saddle and a saddle on similar lines but

padded and intended for those road riders who desire a light rigid seat of racing shape but which shall still be comfortable, are also among the leading models of the line.

## GREAT VARIETY OF BICYCLE HOLDERS.

Rochester, N. Y., Jan. 3.—The Snow Wire Works of this city have made a deal whereby they come into possession of the stock and business of the Westcott Jewell Company of Seneca Falls, N. Y., and assume the sole control of the patented line of bicycle holders heretofore owned by the latter firm and known to the trade as "Security Holders." This deal is of special interest to the jobbers and the trade in general, as there has been an open question the past year in regard to infringement on adjustable bicycle holders. One of the patents secured by the Snow company covers all wall holders having two parallel wires or springs, which hold the wheel and which are adjustable, and the new owners propose to enforce this patent vigorously. With the addition of the Westcott Jewell line, the Snow company will have between 40 and 50 varieties of wall and floor holders.

They will greatly reduce the prices of the "Security Holders" and in every way possible will endeavor to make it an object for the dealers of the country to fit up their stores with strictly high grade holders. There is no one thing, they contend with much truth, which cheapens a store and naturally the goods in it as much as a cheap looking holder.

Their line of holders will be exhibited in spaces 147 at the Chicago show and 187 at the New York show.

## SMITH TAPER GAUGE FORKS,

The C. J. Smith & Sons Co., Milwaukee, is manufacturing a taper gauge fork in which the aim has been to eliminate useless metal and to thicken the walls at the points of

heaviest stress. In many ordinary seamless forks the metal is heavier at the lower end than at the top, straight tubing of even gauge having been swaged into a taper, thus thickening the walls in proportion to the increasing diameter reduction along the taper. The Smith taper gauge fork is a reversal of this, the wall being thickest at the top and gradually thinning toward the bottom. This company states that practical tests have shown its forks to be able to stand from 35 to 50 per cent more strain than ordinary forks, and that when the Smith forks do bend, a gradual curve runs along the entire length of the fork, there being no sharp bend directly below the crown. The process employed for making the taper

# Plain Talks on Andrae Cycles

THEY NEVER DISAPPOINT

... III ...

One great, undeniable reason why you should handle Andrae Cycles is their money-making possibilities.

It is not the profit that you make on one Andrae that counts.

It's the profits on the sales that can be traced to that first sale.

Almost every agent who was selling Andraes five years ago is selling them to-day.

The selling record of no other bicycle is as clean as the Andrae record.

After an agent has made up his mind to sell Andraes we keep right on working in his interest.

We try to create a demand for Andraes in his town—we send customers to his store.

An Andrae agent need not turn away a possible purchaser. He has 14 models, at \$60, \$50, \$40, \$30, with which to please him.

We want to hear from you.

gauge forks at the Smith factory and the machine equipment installed make it possible for the forks to be produced and sold at a very reasonable price.

#### THE TWENTIETH CENTURY BANNER.

Then Twentieth Century Mfg. Co., 17 Warren street, New York, is sending to the trade a neat little catalogue covered in red and gold, describing the construction and operation and bringing out the main technical and commercial advantages of the Twentieth Century oil and acetylene gas bicycle headlights. The catalogue also lists various small cycle lantern accessories made by the company and devotes part of its pages to the new Twentieth Century cyclometer. The company, in keeping with its liberal advertising policy of the past, is also sending out a new wall poster displaying with bold effect both patterns of lamps and in one corner a small picture of the cyclometer.
